Stein was now for a time virtually dictator of the reduced and nearly bankrupt Prussian state. The circumstances of the time and his own convictions, gained from study and experience, led him to press on drastic reforms in a way which could not otherwise have been followed. First came the Edict of Emancipation, issued at Memel on the 9th of October 1807, which abolished the institution of serfdom throughout Prussia from the 8th of October 1810. All distinctions affecting the tenure of land (noble land, peasants' land, &c.) were also swept away, and the principle of free trade in land was established forthwith. The same famous edict also abrogated all class distinctions respecting occupations and callings of any and every kind, thus striking another blow at the caste system which had been so rigorous in Prussia. Stein's next step was to strengthen the cabinet by wise changes, too complicated to be enumerated here. He also furthered the progress of the military reforms which are connected more especially with the name of Scharnhorst (*q.v.*); they refashioned the Prussian army on modern lines, with a reserve system. Stein's efforts were directed more towards civil affairs; and in this sphere he was able to issue a measure of municipal reform (Nov. 19, 1808) which granted local self-government on enlightened yet practical lines to all Prussian towns, and even to all villages possessing more than 800 inhabitants.

Shortly afterwards the reformer had to flee from Prussia. In August 1808 the French agents, who swarmed throughout the land, had seized one of his letters, in which he spoke of his hope that Germany would soon be ready for a national rising like that of Spain. On the 10th of September Napoleon gave orders that Stein's property in the new kingdom of Westphalia should be confiscated, and he likewise put pressure on Frederick William to dismiss him. The king evaded compliance; but the French emperor, on entering Madrid in triumph, declared (December 16) *le nommé Stein* to be an enemy of France and the Confederation of the Rhine; and ordered the confiscation of all his property in the Confederation. Stein saw that his life was in danger and fled from Berlin (Jan. 5, 1809). Thanks to the help of his former colleague, Count Friedrich Wilhelm von Reden, who gave him an asylum in his castle in the Riesengebirge, he succeeded in crossing the frontier into Bohemia.

For three years he lived in the Austrian Empire, generally at Brünn; but in May 1812 he received an invitation from the emperor Alexander I. to visit St Petersburg, seeing that Austria was certain to range herself on the side of France in the forthcoming Franco-Russian War. At the crisis of that struggle Stein may have been one of the influences which kept the tsar determined never to treat with Napoleon. When the miserable remains of the Grand Army reeled back into Prussia at the close of the year, Stein urged the Russian emperor to go on and free Europe from the French domination.

Events now brought Stein rapidly to the front. On the 30th of December 1812 the Prussian general Yorck signed at Tauroggen a convention with the Russian general Diebich for neutralization of the Prussian corps at and near Tilsit, and for the free passage of the Russians through that part of the king's dominions. The Russian emperor thereupon requested Stein to act as provisional administrator of the provinces of East and West Prussia. In that capacity he convened an assembly of representatives of the local estates, which on the 5th of February 1813 ordered the establishment of a militia (*Landwehr*), a militia reserve and a final levy (*Landsturm*). The energy which Stein infused into all around him contributed not a little to this important decision, which pushed on the king's government to more decided action than at that time seemed possible. Stein now went to Breslau, whither the king of Prussia had proceeded; but the annoyance which Frederick William felt at his irregular action lessened his influence. The treaty of Kalisch between Russia and Prussia cannot be claimed as due to his actions, which were reprehended in court circles as those of a fanatic. At that time the great patriot fell ill of a fever and complained of total neglect by the king and court. He recovered, however, in time to take part in the drafting of a Russo-Prussian convention (March 19, 1813) respecting the administration of the districts which should be delivered from French occupation. During the varying phases of the campaign of 1813 Stein continued to urge the need of war *à outrance* against Napoleon. The Allies, after the entry of England and Austria into the coalition, conferred on Stein the important duties of superintending the administration of the liberated territories. After the great battle of Leipzig (Oct. 16–19, 1813) Stein entered that city the day after its occupation by the Allies and thus expressed his feelings on the fall of Napoleon's domination: "There it lies, then, the monstrous fabric cemented by the blood and tears of so many millions and reared by an insane and accursed tyranny. From one end of Germany to the other we may venture to say aloud that Napoleon is a villain and the enemy of the human race."

He now desired to see Germany reconstituted as a nation, in a union which should be at once strong for purposes of defence and founded on constitutional principles. His statesmanlike projects were foiled, partly by the short-sightedness of German rulers and statesmen, but also by the craft whereby the Austrian statesman Metternich (*q.v.*) gained the alliance of the rulers of south and central Germany for his empire, on the understanding that they were to retain their old governing power unimpaired. Thus it was in vain that Stein, during the congress of Vienna, pressed for an effective union of the German people. Austria and the secondary German states resisted all proposals in this direction; and Stein blamed the Prussian chancellor Hardenberg for betraying an indefiniteness of purpose which probably resulted from the same unfortunate defect in Frederick William of Prussia. Stein shared in the desire of all Prussian statesmen at that time to have Saxony wholly absorbed in their kingdom. In that, as in other matters, he was doomed to disappointment. On the 24th of May 1815 he sent to his patron, the emperor Alexander, a detailed criticism of the federal arrangements proposed for Germany, showing that they fulfilled not one of the requirements for real union and constitutional government which had been so loudly demanded by the German people during the struggle of 1813.

The remainder of Stein's career must be briefly dismissed. He passed into retirement after the congress of Vienna, and saw with pain and disgust the postponement of the representative system of government which Frederick William had promised to Prussia in May 1815. He refused to act as Prussian representative at the Frankfort diet, which he regarded as a mere travesty of the central federal institution which he had hoped to see. By indirect means he did what he could to check the violence of political reaction, but he was conscious of his weakness, and that fact embittered the later days of a man who was intensely proud and self-assertive. His chief interest was in the study of history, and in 1818–1820 he worked hard to establish the society for the encouragement of historical research and the publication of the *Monumenta Germaniae historica,* of which his future biographer, Pertz, became the director. Stein died on the 29th of June 1831. He left three daughters.

In some respects there has been a tendency to magnify the achievements of Stein. As usually happens with men of great force of character, the work of less noteworthy individuals is ascribed to the one commanding personality. This was so even during the fourteen months of phenomenal activity, October 1807 to December 1808. More painstaking research has shown that the credit for originating many of the far-reaching reforms then promulgated must be shared with Heinrich Theodor von Schön and many others.[1] It is now recognized that the king himself at that time rendered unsuspectedly large services to the cause of reform. A popular legend named him as the founder of the Tugendbund, an institution which he always distrusted. But when this is granted, it still remains true that Stein's enlightenment, insight into the needs of the time, and almost superhuman energy, imparted to the reform movement a momentum which ensured its triumph at the most critical period which Prussia or any great European state passed through in the 19th century. All his contemporaries were impressed, or even awed by the determination and intellectual power of this remarkable man. His conversation had the effect of calling out all the powers of his interlocutors. "A conversation with him (wrote Varnhagen von Ense) was a continual contest, a continual danger." This mental pugnacity sometimes degenerated into rudeness; and on several occasions his impetuosity led him to take false steps. Still, when we take into consideration the magnitude of his achievements; when we recollect that in 1808 he intended his municipal reform to serve as the foundation for free institutions for the Prussian provinces, and thereafter for the whole kingdom; when we realize the grandeur of his schemes in 1813–1815 for the union of the German people in a federal

[1] Thus Schön's memorandum on the abolition of serfdom was the basis of the law of emancipation; and Stein's *Politisches Testament* was also based on a draft by Schön. Schön was born in 1773, entered the Prussian civil service in 1793, and subsequently held various high ministerial appointments. He was made castellan (*Burggraf*) of Marienburg on his retirement in 1842, and died in 1856. The share claimed by him in Stein's reforms has been the subject of some controversy.

system which would combine strength with political liberty—we shall find it difficult to overrate the importance of his contribution to the solution of the most complex political problem of modern times.

The chief authority on Stein is the biography by G. H. Pertz (6 vols., 1849–1855), but few English readers will find the need of going beyond the admirable *Life of Stein*, by Sir John Seeley (3 vols., Cambridge, 1878), which contains a full bibliography. These works are corrected at a few points by Max Lehmann's *Leben Steins* (Leipzig, 1902–1903). For side-lights on his career and character, see H. F. K., Baron vom Stein, *Lebenserinnerungen* (Hagen, 1901); C. T. Perthes, *Politische Zustände und Personen in Deutschland zur Zeit der französischen Herrschaft* (2 vols., Gotha, 1862); *Denkwürdigkeiten des Staatskanzlers Fürsten von Hardenberg*, ed. by L. von Ranke (5 vols., Leipzig, 1877); Varnhagen von Ense, *Denkwürdigkeiten* (6 vols., Mannheim, 1837–1842; English ed., London, 1847); A. Stern, *Abhandlungen und Aktenstücke aus der preussischen Reformzeit 1807–1815* (Leipzig, 1885); M. Philippson, *Geschichte des preussischen Staatswesens 1786–1813* (2 vols., Leipzig, 1880); M. Lehmann, *Knesebeck und Schön* (Leipzig, 1875); J. P. Hassel, *Geschichte der preussischen Politik, 1807–1815* (Leipzig, 1881); the Vicomte Jean d'Ussel, *Études sur l'année 1813; la défection de la Prusse* (Paris, 1907). (J. Hl. R.)

STEINER, JAKOB (1796–1863), Swiss mathematician, was born on the 18th of March 1796 at the village of Utzendorf (canton Bern). At eighteen he became a pupil of Heinrich Pestalozzi, and afterwards studied at Heidelberg. Thence he went to Berlin, earning a livelihood there, as in Heidelberg, by giving private lessons. Here he became acquainted with A. L. Crelle, who, encouraged by his ability and by that of N. H. Abel, then also staying at Berlin, founded his famous *Journal* (1826). After Steiner's publication (1832) of his *Systematische Entwickelungen* he received, through Jacobi's exertions, who was then professor at Königsberg, an honorary degree of that university; and through the influence of G. J. Jacobi and of the brothers Alexander and Wilhelm von Humboldt a new chair of geometry was founded for him at Berlin (1834). This he occupied till his death, which took place in Bern on the 1st of April 1863.

Steiner's mathematical work was confined to geometry. This he treated synthetically, to the total exclusion of analysis, which he hated, and he is said to have considered it a disgrace to synthetical geometry if equal or higher results were obtained by analytical methods. In his own field he surpassed all his contemporaries. His investigations are distinguished by their great generality, by the fertility of his resources, and by such a rigour in his proofs that he has been considered the greatest geometrical genius since the time of Apollonius.

In his *Systematische Entwickelung der Abhängigkeit geometrischer Gestalten von einander* he laid the foundation of modern synthetic geometry. He introduces what are now called the geometrical forms (the row, flat pencil, &c.), and establishes between their elements a one-one correspondence, or, as he calls it, makes them projective. He next gives by aid of these projective rows and pencils a new generation of conics and ruled quadric surfaces, "which leads quicker and more directly than former methods into the inner nature of conics and reveals to us the organic connexion of their innumerable properties and mysteries." In this work also, of which unfortunately only one volume appeared instead of the projected five, we see for the first time the principle of duality introduced from the very beginning as an immediate outflow of the most fundamental properties of the plane, the line and the point.

In a second little volume, *Die geometrischen Constructionen ausgeführt mittelst der geraden Linie und eines festen Kreises* (1833), republished in 1895 by Öttingen, he shows, what had been already suggested by J. V. Poncelet, how all problems of the second order can be solved by aid of the straight-edge alone without the use of compasses, as soon as one circle is given on the drawing-paper. He also wrote *Vorlesungen über synthetische Geometrie*, published posthumously at Leipzig by C. F. Geiser and H. Schroeter in 1867; a third edition by R. Sturm was published in 1887–1898.

The rest of Steiner's writings are found in numerous papers mostly published in *Crelle's Journal*, the first volume of which contains his first four papers. The most important are those relating to algebraical curves and surfaces, especially the short paper *Allgemeine Eigenschaften algebraischer Curven*. This contains only results, and there is no indication of the method by which they were obtained, so that, according to L. O. Hesse, "they are, like P. Fermat's theorems, riddles to the present and future generations." Eminent analysts succeeded in proving some of the theorems, but it was reserved to L. Cremona to prove them all, and that by a uniform synthetic method, in his book on algebraical curves Other important investigations relate to maxima and minima. Starting from simple elementary propositions, Steiner advances to the solution of problems which analytically require the calculus of variation, but which at the time altogether surpassed the powers of that calculus. Connected with this is the paper *Vom Krümmungsschwerpuncte ebener Curven*, which contains numerous properties of pedals and roulettes, especially of their areas.

Steiner's papers were collected and published in two volumes (*Gesammelte Werke*, 1881–1882) by the Berlin Academy.

See C. F. Geiser's pamphlet *Zur Erinnerung an J. Steiner* (Zurich, 1874).

STEINMETZ, KARL FRIEDRICH VON (1796–1877), Prussian general field-marshal, was born at Eisenach on the 27th of December 1796 and educated at the cadet school of Stolp in Pomerania from 1807 to 1811, in the midst of the misery and poverty caused by the French occupation. At the outbreak of the War of Liberation he and his elder brother made their way through the French posts to Breslau, where, in spite of their poverty, they were at once appointed to the army, the elder as ensign on probation, the younger to the substantive rank of second lieutenant. After a vain attempt to obtain a transfer to the Blücher Hussars, for which regiment he had conceived an intense boyish admiration when it was quartered at Stolp, he was ordered to report himself to York, who treated him and the other officers sent from Breslau with coldness, until young Steinmetz asked "when he was to return to the king who had sent him?" The brothers took part in the hardest fighting of the campaign of 1813, the elder being killed at Leipzig and the younger being more than once wounded. The short halt on the Rhine he utilized in improving his military and general education. In the battles in France he won the second class of the Iron Cross. After the peace he entered Paris but once, fearing to infringe upon the ten ducats that he saved monthly from his pay to send to his mother. For the same reason he held aloof from the pleasures of his more fortunate comrades. His avoidance of youthful excesses enabled him to overcome his earlier bad health and to acquire a physical vigour which he kept to the end of his long career as a soldier. His character as well as his physique was strengthened by his Spartan way of life, but his temper was naturally embittered by the circumstances which imposed this self-restraint. His poverty and want of influence were the more obvious as he was, shortly after the wars, assigned to the 2nd Foot Guards, stationed in Berlin. He rigorously devoted himself to study and to the routine duties of his profession. From 1820 to 1824 he studied with distinction at the General War Academy, and was at the end of the course appointed to the topographical section of the general staff. General von Müffling reported of him that he was arrogant and that he resented "encouragement"—which he probably regarded as patronage—but that his ability would enable him to outdistance his comrades. Steinmetz was too poor to mount himself on the small allowance granted to general staff officers, and had to remain with his regiment in consequence. But shortly after this his marriage to his cousin Julie, the daughter of Lieutenant-General K. F. F. von Steinmetz (1768–1837), not only tempered his fierce and resentful state of mind, but in a measure improved his material prospects, for his father-in-law was generous to the young couple, and his appointment as captain at the Guard Landwehr dépôt at Potsdam, near where the general lived, brought them into daily contact. His brigade commander too, General von Röder, was an excellent soldier, and Steinmetz often spoke in later days of the thorough training he received at his hands. After this from about 1830 his regimental work and his promotion went on without incident for several years in various garrisons, until in 1839 he became major and battalion commander. In this position he had many official differences with his immediate superiors, for he urged a strenuous war training for the troops, in season and out of season, too vigorously for his more conservative comrades, but off parade his relations with all, thanks chiefly to the social gifts of his wife, were of the most pleasant character. In 1848 he was in command of a guard battalion during the disturbances in Berlin, but was not engaged, and soon found more active employment in the Danish

War. At Schleswig he so distinguished himself that Wrangel, the commander-in-chief, told him that he had "decided the battle." He distinguished himself again at Düppel, and Prince William himself decorated him with the order *pour le mérite* on parade. For his campaign journals and letters see supplement to *Militär Wochenblatt* for 1878. On returning he was entrusted with the difficult command of the troops at Brandenburg during the sitting of a democratic popular convention at that place, and after this with the control of some troops that were known to be affected by the prevalent spirit of revolution. At the time of the Olmütz-Bronnzell incident of 1850 he was employed as military governor of Cassel, and in 1851, becoming colonel commandant of the cadet school of Berlin, he at once set about the reformation of the prevailing system of instruction, the defects of which he had openly condemned as early as 1820. Though more than fifty years of age, he now learned Latin and English in order to be a more competent instructor. In 1854, after forty-one years of active service, he was promoted major-general. At Magdeburg, as at Berlin, his reforming zeal made him many enemies, and in October of this year he sustained a loss which almost unhinged his mind in the death of his youngest and only surviving child, a girl of twenty-six. From Magdeburg he was removed to the command of a guard brigade at Berlin (1857), and thence almost immediately to a divisional command in the I. Corps. Early in 1858 he was promoted lieutenant-general, and for the five years that he held this command he devoted himself particularly to acquiring knowledge of the cavalry arm. About 1863, learning that von Bonin, his senior by date, but his junior in age and length of service, was about to be appointed to command the I. Corps, he meditated retirement, but the authorities at the same time as they appointed Bonin made Steinmetz commander of the II. Corps, and shortly afterwards, when the crown prince of Prussia took over this post, commander of the V. Corps at Posen. Shortly after this his wife died. He was promoted general of infantry in 1864, and led the V. Corps to the war against Austria in 1866. This was the chance of his lifetime. His skilful and resolute leadership was displayed in his three battles, won on three successive days, of Nachod, Skalitz and Schweinschädel (see SEVEN WEEKS' WAR), and opened the way through the mountains in spite of the defeat of Steinmetz's rival Bonin at Trautenau. In 1867, in his loneliness, the "Lion of Nachod," as he was popularly called, contracted a second marriage with Elise von Krosigk (who after his death married Count Brühl). He was now, for the first time in his life, a fairly wealthy man, having been awarded a money grant for his brilliant services in 1866. About this time he was elected a member of the North German Confederation parliament.

At the outbreak of the war of 1870 Steinmetz was appointed to command one of the three armies assembled on the Rhine, the others being led by Prince Frederick Charles and the crown prince. It was not long before serious differences arose between Steinmetz and Prince Frederick Charles. The former, embittered by a lifelong struggle against the influences of wealth and position, and perhaps somewhat *grisé* by his successes in 1866, considered an order to clear the roads for the prince's army as an attempt to crowd a humbler comrade out of the fighting line, and various incidents added day by day to his growing resentment until at last on the field of Gravelotte (see METZ and FRANCO-GERMAN WAR for an account of these quarrels) he lost his temper and wasted his troops. After this there was no alternative but to relieve him of the command of the I. Army and to send him home as governor-general of the V. and VI. Army Corps districts. In April 1871 he was retired at his own request, but his great services were not forgotten when victory had softened animosites, and he was promoted general field-marshal, given a pension of 2000 thalers and made a member of the upper chamber. In the spirit of loyalty which had guided his whole career as a soldier he made no attempt to justify his conduct in 1870 either against the criticisms of the general staff history or against unofficial attacks. His life in retirement was quiet and happy, and he retained his bodily health to the last. He died at Bad Landeck on the 2nd of August 1877. The 37th Fusiliers of the German army bear his name as part of their regimental title.

See supplement of *Militär Wochenblatt* (1877 and 1878).

STEINSCHNEIDER, MORITZ (1816–1907), Jewish bibliographer, was born in Moravia in 1816. He was the most accomplished bibliographer in the realm of Hebrew literature. His greatest work was his Catalogue of the Hebrew Collection of the Bodleian Library, Oxford (1852–1860). In this masterly work he settled many questions as to the locality, date and authorship of early printed books, and provided a vast mass of biographical materials. His *Jewish Literature* (published in German in Ersch and Gruber in 1850, in English in 1857, and in Hebrew in 1899) is a complete survey of its subject. Steinschneider prepared many other catalogues (Leiden, Munich, Hamburg and Berlin). He wrote much on Arabic literature, and was the author of bibliographies on a great variety of subjects. Among them may be named bibliographies of Jewish mathematicians and travellers. His most extensive work after his Bodleian Catalogue was his treatise on Hebrew translations in the middle ages (*Die hebräischen Übersetzungen des Mittelalters*, 2 vols., 1893). Much of his work appeared in his periodical *Hebräische Bibliographie* (1859–1882). He died in Berlin in 1907. (I. A.)

STEINTHAL, HEYMANN (1823–1899), German philosopher and philologist, was born at Gröbzig in Anhalt on the 16th of May 1823. He read philosophy and philology at the university of Berlin, where he graduated in 1850. From 1852 to 1855 he studied Chinese (language and literature) in Paris, and in 1863 became extraordinary professor of philology at Berlin. In his philosophic theories he sympathized with Moritz Lazarus, in conjunction with whom he founded in 1859 the *Zeitschrift für Völkerpsychologie und Sprachwissenschaft*. Like Lazarus and the Herbartian school in general, he attached supreme value to psychology, and especially to the psychology of society, the study of which, combined with comparative philology, alone could give trustworthy results. In philology he was an admirer and disciple of Wilhelm von Humboldt, on whose methods he wrote several books.

His principal works are *Der Ursprung der Sprache im Zusammenhang mit den letzten Fragen alles Wissens* (1851; 4th ed., 1888); *Klassification der Sprachen* (1850); *Charakteristik der hauptsächlichen Typen des Sprachbaues* (1860); *Die Entwickelung der Schrift* (1852); *Grammatik, Logik, Psychologie, ihre Prinzipien*, &c. (1885); *Geschichte der Sprachwissenschaft bei den Griechen und Römern* (1863; 2nd ed., 1889–1891); *Die Mande-Negersprachen, psychologisch und phonetisch betrachtet* (1867); *Abriss der Sprachwissenschaft* (2nd ed., 1881); *Allgemeine Ethik* (1880); *Zu Bibel und Religionsphilosophie* (1890 and 1895). His books on von Humboldt appeared in 1848, 1864 and 1867, and in 1884 he published an edition of his works.

STELE, the Greek name (*στήλη*) for a pillar or vertical slab of stone or marble, sometimes decorated with bas-reliefs and bearing inscriptions, and generally terminated with a cresting (*ἐπίθημα*) enriched with the anthemion plant. In later times the stele was crowned with a small pediment. The Way of the Tombs at Athens was lined with stelae, some of them in memory of prominent citizens.

STELLENBOSCH, a town of the Cape province, South Africa, 31 m. by rail E. of Cape Town. Pop. (1904), 7573, of whom 2497 were whites. It lies 360 ft. above the sea in a pleasant upland valley on the Atlantic slope of the coast range, and is, next to the capital, the oldest settlement in the province, having been founded by order of Commandant Simon van der Stell in 1681 and named after him and his wife, whose maiden name was Bosch. The streets are lined with magnificent oaks, while many of the houses with heavy, thatched gables date from the 17th century. Stellenbosch is the headquarters of the Cape branch of the Dutch Reformed Church, and is also an important educational centre. The chief buildings, besides the churches, are the Dutch theological seminary, Victoria College, Bloemhof girls' school, agricultural college and school of mines, laboratory and school of science and the S.A. conservatorium of music. The surrounding district is largely devoted to viticulture and fruit-growing. The vineyards have been replanted with American stocks. The Stellenbosch valley is closed in by ranges of hills beyond which, eastward, lies Frenchhoek valley, with a village of the same name. This district was the headquarters of the Huguenot refugees who settled in South Africa at the close of the 17th century.

In the early days of the Boer War (1899–1902) Stellenbosch was one of the British military bases, and was used as a "remount" camp; and in consequence of officers who had not distinguished themselves at the front being sent back to it, the expression "to be Stellenbosched" came into use; so much so, that in similar cases officers were spoken of as "Stellenbosched" even if they were sent to some other place. The remount dépôt is maintained; horses and mules thrive here.

STEM (O. Eng. *staefn*, *stemn*, cf. Du. *stam*, Ger. *Stamm*, &c., probably related to "staff"), in popular language the stalk of a plant, the trunk of a tree (for the technical use of the term in botany see below). There are many transferred uses of the word, such as for the slender structure which joins the foot or base of a vase or goblet to the bowl, a stock or branch of a family, or, in philology, a derivative from a root, the unchanged part in a series of inflected forms. The stem of a ship is the prow, properly a curved piece of timber or metal to which the two sides are attached at its foremost end. This was a Scandinavian use early adopted in English; the word meant simply post, and custom alone restricted it to the bows rather than to the stern; in Danish the distinction is made between *fram stam* and *bak stam* and also in German, *Vorder-steven Hinter-steven*.

In botany a stem may be defined as an axis bearing leaves. The stem with its leaves is known as the shoot. Structurally it differs from a root in having no development of cells forming a cap over the growing-point. Under the term *caulome* (stem-structure) are included all those parts of a plant morphologically equivalent in bearing leaves. The stem generally ascends, seeking air and light, and has therefore been termed the *ascending axis*. Stems have usually considerable firmness and solidity, but sometimes they are weak, and either lie prostrate on the ground, thus becoming *procumbent*, or climb on plants and rocks by means of rootlets, like the ivy, being then called *scandent*, or twist round other plants in a spiral manner like woodbine, when they are *twining*. Twining plants turn either from right to left, as the French bean, convolvulus, dodder and gourd; or from left to right, as honeysuckle, twining polygonum, hop and black bryony (*Tamus*). In other cases climbing plants are supported by tendrils, as in vine, bryony, passion-flower, or by the tendril-like leaf-stalks, as in clematis and *Tropaeolum*. In warm climates twining plants (*lianas*) often form thick woody stems, while in temperate regions they are generally herbaceous. Some stems are developed more in diameter than in height, and present a peculiar shortened and thickened aspect, as *Testudinaria* or tortoise-plant, cyclamen, *Melocactus*, *Echinocactus* and other Cactaceae; while in many orchids (fig. 1) the stem assumes an oval or rounded form, and is called a *pseudobulb*.

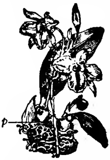

Fig. 1.—Orchid with pseudobulbs, *p*.

Names are given to plants according to the nature and duration of their stems. *Herbs*, or *herbaceous* plants, have stems which die down annually. In some of them the whole plant perishes after flowering; in others, the lower part of the stem forming the *crown of the root* remains, bearing buds from which the stem arises next season. In *biennial* herbs the whole plant perishes after two years, while in *perennial* herbs the crown is capable of producing stems for many years, or new annual products are repeatedly added many times, if not indefinitely, to the old stems. The short permanent stem of herbaceous plants is covered partially or completely by the soil, so as to protect the buds. Plants producing permanent woody stems are called *trees* and *shrubs*. The latter produce branches from or near the ground; while the former have conspicuous trunks. Shrubby plants of small stature are called *under-shrubs* or *bushes*. The limits between these different kinds of stem are not always well defined; and there are some plants occupying an intermediate position between shrubs and trees, to which the name of *arborescent* shrubs is occasionally given.

The stem is not always conspicuous. Plants with a distinct stem are *caulescent*; those in which it is inconspicuous are *acaulescent*, as the primrose, cowslip and dandelion. A similar term is given in ordinary language to plants whose stems are buried in the soil, such as cyclamen or sowbread. Some plants are truly stemless, and consist only of expansions of cellular tissue representing stem and leaf, called a *thallus*, and hence are denominated *Thallogens*, or *Thallophytes*.

The first rudiment of the young shoot of the embryo appears from the seed after the radicle (young root) has protruded. It is termed the *plumule* (fig. 2), and differs from the radicle in the absence of a root-cap and in its tendency to ascend. The apical growing portion constitutes the terminal bud of the plant, and by its development the stem increases in height; projections appear at regular intervals, which are the rudimentary leaves, and in addition there is a provision for the production of lateral buds, which develop into lateral shoots more or less resembling the parent stem, and by these the branching of the plant is determined (fig. 3). These buds are found in the *axil* of previously-formed leaves; or, in other words, in the angle formed between the stem and leaf. They are hence called *axillary*. They are produced like the leaves from the outer portion of the stem (exogenous), and at first consist entirely of cellular tissue, but in the progress of growth vascular bundles are formed in them continuous with those of the stem, and ultimately branches are produced, which in every respect resemble the axis whence the buds first sprang. In the Lycopods branching takes place by forking of the growing-point, the main axis being thus replaced by two equivalent axes (fig. 4); in most cases the new axes develop unequally, the weaker becoming pushed aside and appearing later as a lateral branch of the stronger. The place of origin of the leaf is called a *node*; the intervals between nodes are called *internodes*. The stem, although it has a tendency to rise upwards when first developed, in many instances becomes prostrate, and either lies along the ground partially covered by the soil, or runs completely underneath its surface, giving off roots from one side and buds from the other. Some stems are therefore subterranean, and are distinguished from roots by the provision made for regular leaf-buds.

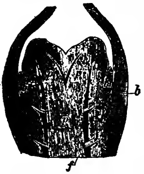
Fig. 3.—Apex of a shoot of a phanerogamic plant.
v, Extreme apex, so-called vegetative cone.
f, Leaf rudiment.
g, Rudiment of an axillary bud.

Growth in length of the stem is due to elongation of the internodes; the zone of most rapid growth is at some distance below the apex; below this the rate of growth gradually diminishes until the portion is reached where growth in length no longer takes place. In some cases, as in the stems of grasses, growth in length persists for a longer time in a small region at the base of the internodes; this is known as *intercalary* growth. In the dwarf or short shoots, such as those of the larch, the internodes do not elongate and the leaves remain close together. Lateral buds give rise to *branches*, from which others, called *branchlets* or *twigs*, arise. The terminal bud, after producing leaves, sometimes dies at the end of one season, and the whole plant, as in annuals, perishes; or part of the axis is persistent, and remains for two or more years, each of the leaves before its decay producing a bud in its axil. This bud continues the growth in spring. In ordinary trees, in which there is provision made for the formation of numerous lateral buds, any injury done to a few branches is easily repaired; but in palms, which only form terminal buds, and have no provision for a lateral formation of them, an injury inflicted on the terminal bud is more likely to have a prejudicial effect on the future plant. In the trees of temperate and cold climates the buds which are developed during one season lie dormant during the winter, ready to burst out under the genial warmth of spring. They are generally protected by external modified leaves in the form of *scales*, which frequently exhibit a firmer and coarser texture than the leaves themselves. They serve a temporary purpose, and usually fall off sooner or later, after the leaves are expanded. The bud is often protected by a coating of resinous matter, as in the horse-chestnut and balsam poplar, or by a thick downy covering, as in the willow. Linnaeus called leaf-buds *hibernacula*, or the *winter quarters* of the young branch. In some plants, as in the plane, the buds destined to live through the winter are so completely surrounded by the base of the petiole as not to be visible until the leaf has fallen off. These are said to be *intrapetiolar*.



(From Strasburger's *Lehrbuch der Botanik*, by permission of Gustav Fischer.)

FIG. 4.—Longitudinal section of a bifurcating shoot (p) of *Lycopodium alpinum*, showing equal development of the rudimentary shoots, p', p''.
b, Leaf rudiments; c, Cortex; f, Vascular strands.

In the bud of a common tree, as the sycamore (fig. 5), there is seen the cicatrix or scar left by the leaf of the previous year c, then the

FIG. 5.—Leaf-bud of Sycamore (*Acer Pseudo-platanus*) covered with scales.

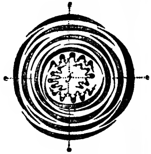


FIG. 6.—Transverse section of the same leaf-bud.

scales e, e, arranged in alternate pairs and overlying each other in what is called an *imbricated* manner. On making a transverse section of the bud (fig. 6), the overlying scales e, e, e, e, are distinctly seen surrounding the leaves f, which are plaited or folded round the axis or growing-point. In plants of warm climates the buds are often formed by the ordinary leaves without any protecting appendages; such buds are called *naked*. A bud may be removed in a young state from one plant and grafted upon another by the process of *budding*, so as to continue to form its different parts; and it may even be made to grow in the soil, in some instances, immediately after removal. In some trees of warm climates, as papawtree, palms and tree-ferns, growth by terminal buds is well seen. In these plants the elongation of the stem is generally regular and uniform, so that the age of the plant may be estimated by its height; as there is no great increase in the leaf area owing to absence of branching, there is no need for a great increase in the diameter of the stem.

Although provision is made for the regular formation of buds, there are often great irregularities in consequence of many being abortive or remaining in a dormant state. Such buds are called *latent*, and are capable of being developed in cases where the terminal bud, or any of the branches, have been injured or destroyed. In some instances, as in firs, the latent buds follow a regular system of alternation; and in plants with opposite leaves it frequently happens that the bud in the axil of one of the leaves only is developed, and the different buds so produced are situated alternately on opposite sides of the stem. Occasionally, after a partial development as branches, buds are arrested and form knots or nodules. The so-called embryo buds or woody nodules in the bark of the beech, elm, olive and other trees are of this nature. They are partially developed buds, in which the woody matter is pressed upon by the surrounding tissue, and thus acquires a very hard and firm texture. When a section is made, they present woody circles arranged around a central pith, and traversed by medullary rays. The nodules sometimes form *knots* on the surface of the stem, at other times they appear as large *excrescences*, and in some cases twigs and leaves are produced by them.

When the terminal bud is injured or arrested in its growth the elongation of the main axis stops, and the lateral branches often acquire increased activity. By continually cutting off the terminal buds a woody plant is made to assume a bushy appearance, and thus *pollard* trees are produced. Pruning has the effect of checking the growth of terminal shoots, and of causing lateral ones to push forth. The peculiar bird-nest appearance often presented by the branches of the common birch depends on an arrestment in the terminal buds, a shortening of the internodes, and a consequent clustering or fasciculation of the twigs. In some plants there is a natural arrestment of the main axis after a certain time, giving rise to peculiar shortened stems. Thus the crown of the root is a stem of this nature, forming buds and roots. Such is also the case in the stem of cyclamen, *Testudinaria*, and in the tuber of the potato. The production of lateral in place of terminal buds sometimes gives the stem a remarkable zigzag aspect.

The mode in which branches come off from the stems gives rise to various forms of trees, as pyramidal, spreading or weeping—the angles being more or less acute or obtuse. In the Italian poplar and cypress the branches are erect, forming acute angles with the upper part of the stem; in the oak and cedar they are spreading or patent, forming nearly a right angle; in the weeping ash and elm they come off at an obtuse angle; while in the weeping willow and birch they are pendulous from their flexibility. The comparative length of the upper and under branches also gives rise to differences in the contour of trees, as seen in the conical form of spruce, and the umbrella-like form of the Italian or Stone pine (*Pinus Pinea*). The branching of some trees is peculiar. In the Amazon district many Myristicaceae and Monimiaceae have whorled branches coming off in fives. This is also seen in the Chili pine.

Branches are sometimes long and slender, and run along the ground, producing buds with roots and leaves at their extremity. This is seen in the *runner* (*flagellum*) of the strawberry. In the house-leek (*Sempervivum*) there is a similar prostrate branch of a shorter and thicker nature, known as an *offset*, producing a bud at its extremity capable of independent existence. In many instances the branch decays, and the young plant assumes a separate existence. Gardeners propagate plants by the process of *layering*, which consists in bending a twig, fixing the central part of it into the ground, and, after the production of roots, cutting off its connexion with the parent. A *stolon* differs from these in being a branch which curves towards the ground, and, on reaching a moist spot, takes root and forms an upright stem, and ultimately a separate plant. This is a sort of natural layering, and the plant producing such branches is called *stoloniferous*. In the rose and mint a subterranean branch arises from the stem, which runs horizontally to a certain extent, and ultimately sends up an aerial stem, which becomes an independent plant. Such branches are denominated *suckers*, and the gardener divides the connexion between the sucker and the parent stem, in order to propagate these plants. In the case of asparagus and other plants which have a perennial stem below ground, subterranean buds are annually produced which appear above ground as shoots or branches covered with scales at first, and ultimately with true leaves. These branches are herbaceous and perish annually, while the true stem remains below ground ready to send up fresh shoots next season. In bananas and plantains the apparent aerial stem is a shoot sent up by an underground stem, and perishes after ripening fruit. Branches are sometimes arrested in their development, and, in place of forming leaves, become transformed into *spines* or *thorns*, as in the hawthorn. Plants which have spines in a wild state, as the apple and pear, often lose them when cultivated, in consequence of their being changed into branches; in some cases, as in the sloe (*Prunus spinosa*) (fig. 7), a branch bears leaves at its lower portion, and terminates in a spine. In some climbing plants some of the shoots are transformed into tendrils, which help the plant to climb by twining about a support, as in passion-flower and vine; or, as in *Ampelopsis Veitchii*, by forming adhesive disks at the tips of their branchlets which enable them to cling to flat supports. In some cases branches become flat and leaf-like, taking the place in the plant economy of the leaves, which are reduced to small scales or spines, as in butcher's broom; branches showing this modification are termed cladodes or phylloclades (fig. 8). In Cactaceae (*e.g. Opuntia*, prickly pear, fig. 9) and fleshy euphorbias, where the leaves are reduced to spines, the fleshy stems become green and perform the functions of leaves; they also serve as water reservoirs for the plants, which are natives of very dry countries.

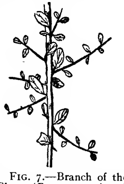

FIG. 7.—Branch of the Sloe (*Prunus spinosa*) producing spines or thorns, which are abortive branches, as shown by their bearing leaves.

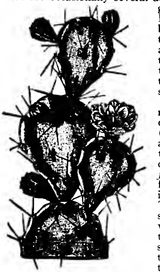
Buds sometimes become extra-axillary in consequence of the non-appearance or abortion of one or more leaves, or on account of the

FIG. 8.—Twig of Butcher's Broom (*Ruscus aculeatus*) slightly enlarged, showing cladodes, *c*.

adhesion of the young branch to the parent stem. In place of one bud there are occasionally several accessory ones produced in the axil, giving origin to numerous branches. By the union of several such buds branches are produced having a thickened or flattened appearance, as is seen in the fir, ash and other trees. In some cases, however, these *fasciated* branches are owing to the abnormal development of a single bud.



(From Strasburger's *Lehrbuch der Botanik*, by permission of Gustav Fischer.)
FIG. 9.—*Opuntia monacanthia*, showing flower and fruit. The leaves are reduced to thorns.

The typical form of stems is rounded. They are sometimes compressed or flattened laterally (fig. 9), while at other times they are angular. Various terms are applied to the forms of stems, as *cylindrical* or *terete*, *quadrangular* or *square*, *jointed* or *articulated*, &c. The following are some of the more important modifications of stems: The *crown of the root* is a shortened stem, often partially underground, which remains in some plants after the leaves, branches and flower-stalks have withered. In this case the internodes are very short, and the nodes are crowded together, so that the plant appears to be stemless. It is seen in perennial plants, the leaves of which die down to the ground annually. A *rhizome* or *root-stock* (fig. 10) is a horizontal stem usually sending out numerous roots and leaf-buds from its upper surface. It occurs in ferns, iris, *Hedychium*, *Acorus* or sweet flag, ginger, waterlily, many species of

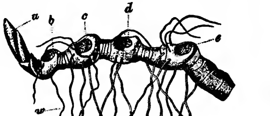


FIG. 10.—Rhizome of *Polygonatum multiflorum* (Solomon's Seal), forming buds and adventitious roots.
a, bud which will form the aerial shoot next season; *b*, *c*, *d*, *e*, scars of successive aerial shoots; *w*, root.

Carex, rushes, anemone, &c. The leaves are reduced to scales and by their presence, and the absence of a root-cap, a rhizome can be distinguished from a root. A rhizome such as occurs in Solomon's seal (fig. 10) is not a single stem, *i.e.* the product of a single bud, but is composed of portions of successive axes, the aerial parts of which have died off, leaving their scars (fig. 10, *b*, *c*, *d*, *e*). Rhizomes are well seen in British ferns. A rhizome sometimes assumes an erect form, as in *Scabiosa succisa*, in which the so-called *praemorse* root is in reality a rhizome, with the lower end decaying. The erect rhizome of *Cicuta virosa* (water-hemlock) shows hollow internodes, separated by partitions. In the coral-root orchid *Corallorhiza*, which grows in soil rich in humus, no roots are developed, the coral-like branching rhizome acting as the absorbing organ (fig. 13). A *pseudobulb* (fig. 1) is an enlarged bulbous-like aerial stem, common in epiphytic orchids; it is covered with a thick epidermis and acts as a water-store for the plant, which from its growth on branches of trees and in similar positions is often unable to get sufficient water for its immediate needs. A *sobole* is a creeping underground stem, sending roots from one part and leaf-buds from another, as in couch-grass, *Carex arenaria*, and *Scirpus lacustris*. It is often called a creeping root, but is really a rhizome with narrow elongated internodes. A *tuber* is a thickened stem or branch produced by the approximation of the nodes and the swelling of the internodes, as in the potato. The eyes of the potato are leaf-buds. Tubers are sometimes aërial, occupying the place of branches. The ordinary herbaceous stem of the potato, when cut into slips and planted, sends off branches from its base, which assume the form of tubers. Tubers frequently store up a quantity of starch, as in *Maranta arundinacea*, whence arrowroot is derived. Another form of thickened underground stem is the *corm*, as seen in the autumn crocus (*Colchicum*, fig. 11), gladiolus, &c. Structurally it is composed of a solid more or less rounded axis covered by a layer of thin membranous scales (fig. 12, *h*, *h*). A corm is only of one year's duration, giving off buds annually in

k″,	Young corm produced from *k′* in autumn, which in succeeding autumn will produce flowers.

the form of young corms. In autumn the young corm gives origin to leaves, the lower of which (*s*, *s′*, *s″*) form sheaths round the corm and flower stalk, the upper (*l′*, *l″*) remaining very small; and in the axil of the uppermost leaves the flowering-stem develops and bears the flowers (*b*, *b′*). Meanwhile in the axil of one of the middle leaves on the corm, a bud—the rudiment of a new corm—appears (*k″*). The flowering-stem dies down, and the young corm *k′* from which it arose enlarges greatly during the winter at the expense of its parent corm (*k*), which thus becomes shrivelled. In spring the leaves produced on it (*l′*, *l″*), which were merely rudiments in autumn, appear above ground as conspicuous large leaves. At the end of spring these leaves die down, the bases of the lower ones alone remaining, and constituting thin brown scales around the corm (as at *h*). Meanwhile, the young bud-corm (*k″*) in the axil of the middle leaf grows rapidly at the expense of its parent corm (*k′*), but it does not attain a great size. In autumn it produces new leaves, which remain small, but from the axil of the two upper the flowering stem rises up and bears flowers; whilst in the axil of one of its middle leaves a new bud-corm appears, which will the following autumn produce young leaves, flowering stem, and a new bud-corm, and thus the cycle goes on. The buds or new corms formed from the old corms may be produced either laterally, as in *Colchicum autumnale*, or terminally, as in crocus and gladiolus. The *bulb* is another form of underground stem or bud. The axis in this case is much shortened, and the internodes are hardly developed. The bases of the leaves rising from the stem are quite close together, and become succulent and enclose the axis. In the lily the thick and narrow scales are arranged separately in rows, and the bulb is called *scaly*; while in the leek, onion, squill and tulip the scales are broad, and enclose each other in a concentric manner, the outer ones being thin and membranous, and the bulb is *tunicated*. In the axils of these fleshy scales new lateral shoots arise, forming new bulbs. The lateral buds or *cloves* sometimes remain attached to the axis, and produce flowering stems, so that apparently the same bulb continues to flower for many years, as in the hyacinth and tulip; at other times the young bulbs are detached, and form separate plants. In the axil of the leaves of *Lilium bulbiferum*, *Dentaria bulbifera*, and some other plants, small conical or rounded bodies are produced, called *bulbils* or *bulblets* (fig. 14, *b*). They resemble bulbs in their aspect, and consist of a small number of thickened scales enclosing a growing-point. These scales are frequently united closely together, so as to form a solid mass. Bulbils are therefore transformed leaf-buds, which are easily detached, and are capable of producing young plants when placed in favourable circumstances. The scales in bulbs vary in number. In *Gagea* there is only one scale; in the tulip and *Fritillaria imperialis* they vary from two to five; while in lilies and hyacinths there are a great number of scales. In the tulip a bud is formed in the axil of an outer scale, and this gives rise to a new flowering axis, and a new bulb, at the side of which the former bulb is attached in a withered state.

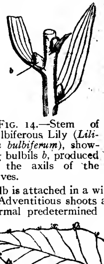

FIG. 14.—Stem of Bulbiferous Lily (*Lilium bulbiferum*), showing bulbils *b*, produced in the axils of the leaves.

Adventitious shoots are those which arise elsewhere than in the normal predetermined place, as from old stems, or roots. Such shoots are frequent on the roots of elm, poplar, plum and other fruit-trees. Occasionally adventitious buds are produced on the edges of leaves, as in *Bryophyllum calycinum* (fig. 15), *Malaxis paludosa*, and various species of *Asplenium*, and on the surface of leaves, as in *Ornithogalum thyrsoideum*. These are capable of forming independent plants. Similar buds are also made to appear on the leaves of *Begonia*, *Gesnera*, *Gloxinia* and *Achimenes*, by wounding various parts of them, and placing them in moist soil; this is the method often pursued by gardeners in their propagation. The ipecacuanha plant has been propagated by means of leaves inserted in the soil. In this case the lower end of the leaf becomes thickened like a corm, and from it roots are produced, and ultimately a bud and young plant.

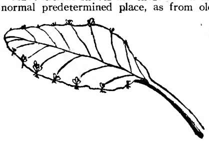

FIG. 15.—Leaf of *Bryophyllum calycinum*, producing buds along the margin, at the extremities of the primary veins.

STENBOCK, MAGNUS GUSTAFSSON, COUNT (1664–1717), Swedish soldier, was educated at Upsala and at Paris, chose the military profession, and spent some years in the service of the United Provinces. Returning to Sweden he entered the army, and in 1688 became major. He served with the Swedes in the Low Countries and on the Rhine, distinguishing himself for skill and courage at Fleurus. During the War of the Grand Alliance he was employed not only in the field but also as a confidential agent in diplomatic missions. Soon afterwards as colonel of the Dalecarlian regiment he led it in the astonishing victory of Narva. He distinguished himself still more at Dünamünde, Klissow and Cracow. In 1703 he fought the successful battle of Pultusk, and three years later, having reached the rank of general of infantry, was made governor-general of the province of Scania, which he delivered from the Danish invaders by the decisive victory of Helsingborg. He was a great favourite with Charles XII. in the earlier campaigns, but later the two drifted somewhat apart. It is recorded that the king, before whom General Lagercrona accused Stenbock of drunkenness, replied that "Stenbock drunk was more capable of giving orders than Lagercrona sober." His activities were not confined to war and diplomacy; the university of Lund was under his care for some years, and he had no mean skill as a painter and a poet. He became councillor in 1710, and Charles gave him his field marshal's bâton in 1712. In the same year he invaded Mecklenburg (with but 9000 men) in order to cover Stralsund. He won the brilliant action of Gadebusch, but numbers prevailed against him in the end. Cut off in Tönning he was forced to surrender after a gallant resistance, and passed into captivity. Five years of harsh treatment in Copenhagen brought his life to a close in 1717.

See Loenbom, *Magni Stenbocks lefverne* (1757–1765); Lilljestråle, *Magnus Stenbock* (Helsingborg, 1890).

STENCIL, a thin plate or sheet of metal, leather, paper or other material cut or pierced with a pattern or design; this is laid upon a surface and colour or ink is brushed or rubbed over it, thus leaving the ground colour of the surface imprinted with the design or pattern cut out. In ceramics the stencil is produced by coating the biscuit with a preparation which prevents the transfer-paper or enamelling from adhering to the surface at those parts where the original colour of the biscuit is to be preserved. According to Skeat (*Etym. Dict.*, 1910) the word stands for an earlier *stinsel*, and is to be derived from Old French *estinceller*, to sparkle, to powder with stars, an old term in heraldry, from Latin *scintilla*, a spark. The same French word has given the English "tinsel," strips, disks or pieces of thin glittering metallic substances used for the decoration of fabrics, hence any gaudy, showy and pretentious material or substance.

STENDAL, a town of Germany, in the province of Prussian Saxony, picturesquely situated on the Uchte, 70 m. W. of Berlin on the main line of railway to Hanover and at the junction of lines to Bremen, Magdeburg and Wittenberge. Pop. (1905), 23,281. Among the relics of its former importance are the cathedral, built in 1420–1424 (though originally founded in 1188), restored in 1893 and now housing the archaeological collection of the Altmark, the Gothic church of St Mary, founded in 1447, a "Roland column" of 1535, and two fortified gateways, dating from the 13th century. The last form the chief remains of the ancient fortifications, the site of which is now mostly occupied by promenades. A monument to the archaeologist Johann Joachim Winckelmann (1717–1768) commemorates his birth in the town. Stendal is the seat of a large railway workshop, and carries on various branches of textile industry, besides the manufacture of tobacco, machinery, stoves, gold-leaf, &c. The earliest printing-press in the Altmark was erected here, and published an edition of the *Sachsenspiegel* in 1488 as its first book.

Stendal was founded in 1151 by Albert the Bear, on the site of a Wendish settlement, and soon afterwards acquired a municipal charter. Becoming capital of the Altmark and a frequent imperial residence, it rose to a considerable degree of prosperity, in part recently restored to it by its railway connexions. When the mark was divided in 1258, Stendal became the seat of the elder or Stendal branch of the house of Ascania, which, however, became extinct in 1320. The original Wends were gradually fused with the later Saxons, although the Platea Slavonica, mentioned in 1475, was still distinguished as the Wenden Strasse in 1567. The population still exhibits a marked Slavonic element.

See Götze, *Urkundliche Geschichte der Stadt Stendal* (Stendal, 1873).

STENO, NICOLAUS (1631–1686), Danish naturalist, was born at Copenhagen in 1631, and studied medicine and anatomy in that city and in Paris. After a period of travel he settled in Italy (1666) at first as professor of anatomy at Padua, and then in Florence as house-physician to the grand-duke Ferdinand II. of Tuscany. He returned to his native city in 1672 to become professor of anatomy, but, having become a Roman Catholic, he found it expedient to return to Florence, and was ultimately made apostolic vicar of Lower Saxony. He died at Schwerin in Mecklenburg, on the 25th of November 1686. His fame rests on *De solido intra solidum naturaliter contento*, published at Florence in 1669. In this notable work Steno described various gems, minerals and petrifactions (fossils) enclosed within solid rocks. He compared the fossil with the living organisms, and distinguished marine and fluviatile formations. He argued also in favour of the original horizontality of sedimentary deposits.

See *Di Nicola Stenone e dei suoi studii geologici in Italia*, by G. Capellini (1870); K. A. von Zittel's *History of Geology and Palaeontology* (Eng. ed., 1901); and W. J. Sollas, in *Science Progress* for Jan. 1898.

STENOGRAPHY (from Gr. *στενός*, close, narrow, and *γράφειν*, to write), the system or art of writing by signs representing single sounds or groups of sounds, single words or groups of words, sometimes also styled "brachygraphy" (Gr. *βραχύς*, short); it is a general term including all the various systems of shorthand writing (see SHORTHAND).

STENTOR, one of the Greeks before Troy (*Iliad*, v. 783), whose voice was as loud as that of fifty men. It is said that he came by his death as the result of challenging Hermes, the crier of the gods, to a contest. Possibly, like Hermes himself, Stentor is a personification of the wind. The name is used in modern times of any one possessing a particularly loud voice (stentorian).

STENTOR, a genus of heterotrichous ciliate Infusoria (*q.v.*), so named by R. Oken. It possesses a large moniliform meganucleus, accompanied by numerous micronuclei, and has a trumpet shape, when at rest, anchored by pseudopodial outgrowths from the narrow end. It is relatively large, and is much utilized to demonstrate myonemes, and had been also the object of interesting studies on regeneration, any piece, containing with a fragment of the meganucleus at least one micronucleus, regenerating the whole animal (see REGENERATION). *S. polymorphus* often inhabits a gelatinous sheath and may be green with zoochlorella; it attains a length of $\frac{1}{20}$ in. *S. caeruleus* and *igneus* are coloured blue and scarlet respectively by pigment granules in the ectosarc: E. R. Lankester made a study of the pigment of the former (blue stentorin).

STEPHAN, HEINRICH VON (1831–1897), German statesman, was born at Stolp, in Pomerania, on the 7th of January 1831. From his earliest years he showed that talent for languages to which he owed so much of his success in life, and before he went to school had acquired a considerable knowledge of Italian, Spanish and English. He was educated at the grammar school of his native town, and at the age of sixteen entered the service of the Prussian post office. His promotion was rapid; he was transferred to East Prussia, and thence to Cologne. Here he added to his salary by writing dramatic criticism, and here he obtained his first acquaintance with the system, or rather lack of system, which with its complication of charges made all international postal correspondence so expensive and uncertain—a system which he was in later years to revolutionize. After passing the examinations which admitted him to the higher branches of the service he was transferred to Frankfort-on-the-Oder, and in 1856 to Berlin. Many different stories are told of the manner in which his exceptional knowledge of European languages was brought to the knowledge of the postmaster-general, who at once saw that capacity and attainments of the kind could best be used at headquarters. During the next few years he was entrusted with very important duties; he was chosen as Prussian representative when a postal treaty was arranged with Spain and Portugal. In 1864 he was given the task of reorganizing the postal service in the conquered duchies of Schleswig and Holstein, and in 1866 it fell to his lot to extend the Prussian system to the newly annexed provinces; he had to take over and replace the system by which for three hundred years the family of Thurn and Taxis had conducted the postal service of central Germany. He also found time to write works on the history of postal matters, viz. a *History of the Prussian Post Office* (1859), and articles on the means of communication in ancient and medieval times, which appeared in Raumer's *Historisches Taschenbuch* (1868). He was one of the invited guests at the opening of the Suez Canal, and in 1872 published a work on modern Egypt.

In 1870, at the early age of thirty-nine, Stephan was made postmaster-general of the North German confederation, and in the next year of the newly founded empire; in 1878, at the general reorganization of the imperial administration (see article GERMANY) the post office was made a separate department, and his title was altered to that of secretary of state. His great powers of organization were at once shown in the arrangement of the admirable *Feld Post*, which during the war with France maintained communication with the army in the field. In eight months 89,000,000 letters, 2,500,000 post-cards, and £10,000,000 in money passed through the department, and it was his boast that letters were delivered to and collected from the soldiers with almost unfailing regularity, sometimes even on the field of battle. In this way he began what was the great work of his life, that of making the post office in the truest sense of the word popular, and henceforth he was unremittingly occupied in devising and adopting new contrivances for the convenience and use of the people. The introduction of post-cards was his first innovation. In this he had been anticipated by Austria, but the idea was his own, and had been adopted by the Austrians in consequence of a suggestion made by him at a postal conference in 1865. The development of the parcel post and of the system of money orders was his next work, and in this he was so successful that in 1883 the German post office dealt with 79,000,000 parcels, while in all the other countries of the world together only 52,000,000 went through the post. While in this and other ways he extended the use of the post office at home, he gained a wider celebrity in being the chief promoter of the International Postal Union. He presided at the first conference, which met at Bern in 1874.

The alacrity of Stephan's intelligence and his enthusiasm for the institution over which he presided were shown by the readiness with which he applied or took over all new inventions which might be of public service, such as telegraphs, telephones and pneumatic tubes. His pride in the post office showed itself in the immediate interest which he took in the design and plan of the new offices which were erected in all parts of Germany; it was always his ambition that the post office in each town should be the most conspicuous and the handsomest of public buildings, even at the sacrifice of economy. He warmly supported Bismarck in his policy of extending and promoting national industry and foreign trade, and arranged the subsidies by which a direct postal service was established between Germany and China and Australia. His national feeling also showed itself in the support which he gave to the movement for purifying the German language of foreign words—but he did not always succeed in avoiding the exaggeration verging on the ridiculous into which this movement so easily degenerates. While he stood aloof from ordinary party politics, he was a frequent speaker in the Reichstag on the affairs of his own department, and was a member of the Bundesrat. Though never on terms of intimate friendship with Bismarck, his mastery in his own department won for him the appreciation of the chancellor, and he was allowed more independence than most of the officials. By the power of working out broad and general principles in detail and idealizing the routine work of administration he may fairly be placed among the great administrators by whom (far more than by statesmen and politicians) the Prussian state has been built up, and he was singularly fortunate in that his life fell at a time when by perfecting the administration of the newly founded imperial post he took no small part in strengthening the national idea and binding together the German nation. In 1897 blood-poisoning, arising from a wound in the foot, made amputation of the leg necessary, and he died from the effects of the operation, on the 8th of April 1897.

See E. Knickeberg, *H. v. Stephan* (Berlin, 1897). (J. W. He.)

STEPHANITE, a mineral consisting of silver sulphantimonite, Ag_5SbS_4; containing 68·5 % of silver, and sometimes of importance as an ore of this metal. Under the name *Schwarzerz* it was mentioned by G. Agricola in 1546, and it has been variously known as "black silver ore" (Ger. *Schwarzgültigerz*), brittle silver-ore (*Sprödglanzerz*), &c. The name stephanite was proposed by W. Haidinger in 1845 in honour of the archduke Stephan of Austria; French authors use F. S. Beudant's name *psaturose* (from the Greek ψαθυρός, fragile). It frequently occurs as well-formed crystals, which are orthorhombic and occasionally show indications of hemimorphism: they have the form of six-sided prisms or flat tables terminated by large basal planes and often modified at the edges by numerous pyramid-planes. Twinning on the prism-planes is of frequent occurrence, giving rise to pseudo-hexagonal groups like those of aragonite. The colour is iron-black, and the lustre metallic and brilliant; on exposure to light, however, the crystals soon become dull. The mineral has a hardness of 2½ and is very brittle; the specific gravity is 6·3. Stephanite occurs with other ores of silver in metalliferous veins. Localities which have yielded good crystallized specimens are Freiberg and Gersdorf near Rosswein in Saxony, Chañarcillo in Chile, and exceptionally Cornwall. In the Comstock lode in Nevada massive stephanite and argentite are important ores of silver. (L. J. S.)

STEPHANUS BYZANTINUS (Stephen of Byzantium), the author of a geographical dictionary entitled Ἐθνικά, of which, apart from some fragments, we possess only the meagre epitome of one Hermolaus. This work was first edited under the title Περὶ πόλεων (Aldus, Venice, 1502); the best modern editions are by W. Dindorf and others (4 vols., Leipzig, 1825), A. Westermann (Leipzig, 1839), and A. Meineke (vol. i., Berlin, 1849). Hermolaus dedicates his epitome to Justinian; whether the first or second emperor of that name is meant is disputed, but it seems probable that Stephanus flourished in the earlier part of the 6th century, under Justinian I. The chief fragments remaining of the original work (which certainly contained lengthy quotations from classical authors and many interesting topographical and historical details) are preserved by Constantine Porphyrogennetos, *De administrando imperio*, ch. 23 (the article Ἰβηρίαι δύο) and *De thematibus*, ii. 10 (an account of Sicily); the latter includes a passage from the comic poet Alexis on the Seven Largest Islands. Another respectable fragment, from the article Δύμη to the end of Δ, exists in a MS. of the Seguerian library.

See the editions of Westermann, Dindorf and Meineke, above noticed; the article "Stephanus Byzant.," in Smith's *Dictionary of Ancient Biography*, vol. iii.; E. H. Bunbury, *History of Ancient Geography*, i. 102, 135, 169; ii. 669–671 (London, 1883); Riese, *De Stephani Byzant. auctoribus* (Kiel, 1873); J. Geffcken, *De Stephano Byzantio* (Göttingen, 1886); Spuridon Kontogones, *Διορθωτικὰ εἰς τὰ Ἐθνικά* (Erlangen, 1890); Paul Sakolowski, *Fragmenta d. S. von B.*; E. Stemplinger, *Studien zu d. Ἐθνικά*.

STEPHEN, the "proto-martyr" (as he is called in certain MSS. of Acts xxii. 20), in some senses the greatest figure in primitive Christianity prior to Paul's conversion, was one of "the Seven" (xxi. 8, nowhere called "deacons") set over the "daily ministration" towards the needy members of the Jerusalem community. But, like Philip and perhaps others of his colleagues (vi. 3), he had higher gifts than his office would suggest. We read that he was "full of faith and of the holy Spirit"; and as his spiritual power seems to have shown itself in mighty deeds as well as words (vi. 5, 8), he became a marked man in Jerusalem. Himself a Jew of Greek culture, he naturally tried to win over his fellow Hellenists (vi. 9).

It is here that Stephen's advance upon the Apostolic teaching becomes apparent. His special "wisdom" lay in greater insight into the merely relative nature and value of the externals of Israel's religion, and particularly those connected with the Temple. His fellow Hellenists were as a body eager to disprove the feeling of the native "Hebrews" that they were only half Jews; accordingly teaching which minimized the value of the sacred "customs which Moses had delivered" (vi. 14)—by making salvation turn immediately upon faith in Jesus as Messiah—would cause deep resentment in such circles, in spite of their more liberal attitude to things non-Jewish. They may have met Stephen's appeal for faith in Jesus as Messiah by saying that full fellowship with God was theirs by observance of the Mosaic customs, centring in the Temple, which in Jerusalem overshadowed men's thoughts touching the Divine presence. To this he would reply by warning them in Jesus' own words, supported by those of the prophets, that the heart is the true seat of the Shekinah; and that if they refused God manifest in His Messiah, the final embodiment of Divine righteousness, no holy "customs"—no, not the Temple itself—could save them from the displeasure of the living God. Nay, God might have to make good Messiah's words as to His person being more essential to fellowship with God than the Temple itself (cf. Matt. xii. 6), which might even be destroyed, as it had been in the past, without loss to true religion. In all this he was but reasserting the prophetic rather than the scribal view of the Mosaic Law and its institutions, viz. that the inner spirit, that which could be written on the heart, was the only thing really essential. But they could not rise to this conception and treated his words as "blasphemous against Moses and against God," and roused "the people and the elders and the scribes" against him.

He was seized and brought before the Sanhedrin on the charge of speaking "against the Temple and the Law" (vi. 11–14). His defence against this twofold charge took the form of a survey of Israel's religious past, with a view to show: (1) that "the God of Glory" had covenant relations with their forefathers before they had either Holy Place (Land or Temple) or Law (vii. 1–17); (2) that the first form of visible meeting place between God and His people was far other than that for which absolute sanctity was now claimed. Nay, the form of "the tabernacle of testimony in the wilderness" (no Holy Land) had more divine sanction[1] than any later Temple (44–47); (3) that, after all, the presence of "the Most High" was in no way bound up with any structure of human hands, as Isaiah witnessed (48–50). The moral of all this was plain: Israel's forms of fellowship with the Most High had all along been relative and subject to change. Particularly was this so with the external forms of cultus then represented by the Temple. Hence there was no "blasphemy" in suggesting that in the Messianic age yet another change might come about, and that observance of Temple services could prove little as to acceptance with God. But there is another and more actual line of pleading. This is found in the elaborate section dealing with the person and work of Moses, the great lawgiver (17–38)—a section full of extra-biblical touches—followed by one on Israel's hardness of heart towards him and the "living oracles" he mediated, together with its result, the Exile (39–43). Pure and original Mosaism, embodied in Moses and his ministry to Israel, is represented as something which in its full spiritual intention had been frustrated by Israel's stiffneckedness (39, 42 seq.). The figure of Moses is made to stand forth in ideal outlines, the thinly-veiled Christian application shining through. "This is that Moses who said unto the children of Israel, 'A prophet

[1] The solemn language in v. 44 suggests that to Stephen, as to the writer to the Hebrews (and perhaps Hellenists generally), the Biblical Sanctuary, as corresponding to the heavenly archetype, was more sacred than the Temple of Herod, which owed what sanctity it had to the older features it still preserved.

shall God raise up unto you . . . like unto me.' This is he that was in the Church in the wilderness with the angel which spake to him in the Mount Sinai, and with our fathers; who received living oracles to give unto us: to whom our fathers would not be obedient, but thrust him from them, and turned back in their hearts. . ." (38 seq.). Here we have the very situation as between Stephen and his hearers; and it is made unmistakable by the speaker's closing words (51–53). They will have nothing to say to the greater Mediator of the Divine oracles in Messianic clearness and power. But if so, the reason is not their fidelity to the Mosaic Law, but their infidelity to its spiritual substance. Had they kept the Law dutifully they would have believed on Him in whom true Mosaism was fulfilled and transcended.

In all this there are points both of contact and divergence between Stephen and Paul. Alike they are champions of the "spirit" against the "letter"; and alike they tax unbelieving Judaism with failure to keep the Law in its real sense. But here difference begins. Quite apart from the externalism of Temple worship, to which Paul never alludes, they start from different conceptions of the Law. Stephen, the Hellenist, views it idealistically and with the spiritual freedom of the prophets and of Jesus Himself. But Paul took it more strictly (see PAUL). Thus in spite of general kinship of spirit, Stephen is not really Paul's forerunner. He has no sense of antithesis between law and grace; and he makes no reference to the Gentiles. It is rather the author of the Epistle to Hebrews (*q.v.*) who recalls Stephen. Both deal largely with the Temple and its worship; both expose the externalism of the legal rites of Judaism, as tending to spiritual unreality; and both view the Gospel as the sublimation of the Law on ideal lines. Only, the later thinker contrasts even pure Mosaism with the Gospel of Christ, as old with new, as the Covenant of shadow with that of reality.

As to the authenticity of Stephen's speech, it is generally admitted to be accurate in substance, if not in the words that he uttered. We may suppose it lived in the memory of some associate in such discussions, who would often repeat its tenor in his work as one of the preachers scattered (viii. 4, xi. 19) by the persecution which Stephen's preaching brought on the Jerusalem community, particularly on its Hellenistic section as most identified with the revolutionary aspect which faith in Jesus the Nazarene now for a time assumed in public estimation (contrast ii. 47). It would finally be committed to writing, largely because it was so representative of the Hellenistic view of the relations of Judaism and Christianity. As such it was given prominence in the book of Acts—a work which shows the greatness of the contributions to the Apostolic age not only of Paul, but also of the Hellenists, those mediators between Jews and Gentiles. Possibly also Paul had spoken in Luke's hearing of Stephen's martyrdom and his own close relations to it (vii. 58, 60, cf. vi. 9).

Stephen's actual martyrdom is described as tumultuary in character, though the legal forms of stoning for blasphemy were observed (58). This is quite consistent with a trial before the Sanhedrin; nor is it inconceivable that an act exceeding the rights of that body under the Romans should have taken place at the impulse of religious fanaticism. Our knowledge of Jewish history is not full enough to warrant denial of the historicity of this feature of the narrative simply on the score of its illegality. Neither is there good reason to assume that the hearing before the Sanhedrin is a touch added by the author of Acts to the source on which he has drawn in the main.

LITERATURE.—All requisite materials will be found in articles in the *Ency. Bib.* vol. iv., and Hauck's *Realencykl. f. protestant. Theol. u. Kirche*, vol. xix. The former in particular examines the Midrashic elements (adding to or diverging from the O. T. data) in Stephen's speech, the linguistic features of Acts vi. 1, viii. 3, and various theories as to the source or sources used therein. It also refers to the worthless legends touching Stephen's death and the finding of his relics, collected in Tillemont, *Mémoires* (Eng. ed., 1735), pp. 353–359. (J. V. B.)

STEPHEN (1097?–1154), king of England, was the third son of Stephen Henry, count of Blois and Chartres, and, through his mother Adela, a grandson of William the Conqueror. Born some time before 1101, he was still a boy when he was taken into favour by his uncle, Henry I. of England. From Henry he received the honour of knighthood and the county of Mortain. In 1118 he severed his connexion with Blois and Chartres, renouncing his hereditary claims in favour of his elder brother Theobald. But he acquired the county of Boulogne by marrying Matilda (*c.* 1103–1152), the heiress of Count Eustace III. and a niece of Henry's first wife. The old king arranged this match after the untimely loss of his son, William Atheling, in the tragedy of the White Ship; until 1125 Stephen was regarded as the probable heir to the English throne. But the return of the widowed empress Matilda (*q.v.*) to her father's court changed the situation. Henry compelled Stephen and the rest of his barons to acknowledge the empress as their future ruler (1126). Seven years later these oaths were renewed; and in addition the ultimate claims of Matilda's infant son, Henry of Anjou, were recognized (1133). But the death of Henry I. found the empress absent from England. Stephen seized the opportunity. He hurried across the Channel and began to canvass for supporters, arguing that his oaths to Matilda were taken under coercion, and that she, as the daughter of a professed nun, was illegitimate. He was raised to the throne by the Londoners, the official baronage and the clergy; his most influential supporters were the old justiciar, Robert, bishop of Salisbury, and his own brother Henry, bishop of Winchester. Innocent II. was induced by Bishop Henry to ratify the election, and Stephen thus cleared himself from the stain of perjury. Two charters of liberties, issued in rapid succession, confirmed the King's alliance with the Church and earned the good will of the nation. But his supporters traded upon his notorious facility and the unstable nature of his power. Extortionate concessions were demanded by the great barons, and particularly by Earl Robert of Gloucester, the half-brother of the empress. The clergy insisted that neither their goods nor their persons should be subject to secular jurisdiction. Stephen endeavoured to free himself from the control of such interested supporters by creating a mercenary army and a royalist party. This led at once to a rupture between himself and Earl Robert (1138), which was the signal for sporadic rebellions. Soon afterwards the king attacked the bishops of Salisbury, Ely and Lincoln—a powerful family clique who stood at the head of the official baronage—and, not content with seizing their castles, subjected them to personal outrage and detention. The result was that the clergy, headed by his brother, the bishop of Winchester, declared against him (1139). In the midst of these difficulties he had left the western marches at the mercy of the Welsh, and the defence of the northern shires against David of Scotland had devolved upon the barons of Yorkshire. Stephen was thoroughly discredited when the empress at length appeared in England (Sept. 30, 1139). Through a misplaced sense of chivalry he declined to take an opportunity of seizing her person. She was therefore able to join her half-brother at Gloucester, to obtain recognition in the western and south-western shires, and to contest the royal title for eight years. Stephen's initial errors were aggravated by bad generalship. He showed remarkable energy in hurrying from one centre of rebellion to another; but he never ventured to attack the headquarters of the empress. In 1141 he was surprised and captured while besieging Lincoln Castle. The empress in consequence reigned for six months as "Lady (*Domina*) of the English"; save for her faults of temper the cause of Stephen would never have been retrieved. But, later in the year, his supporters were able to procure his release in exchange for the earl of Gloucester. After an obstinate siege he expelled Matilda from Oxford (Dec. 1142) and compelled her to fall back upon the west. The next five years witnessed anarchy such as England had never before experienced. England north of the Ribble and the Tyne had passed into the hands of David of Scotland and his son, Prince Henry; Ranulf earl of Chester was constructing an independent principality; on the west the raids of the Angevin party, in the east and midlands the excesses of such rebels as Geoffrey de Mandeville, earl of Essex, turned considerable districts into wildernesses. Meanwhile Geoffrey of Anjou, the husband of the empress, completed the conquest of Normandy (1144). In 1147 the situation improved for Stephen; Robert of Gloucester, the ablest of the Angevin partisans, died, and the empress left England in despair. But her son soon appeared in England to renew the struggle (1149) and conciliate new supporters. Soon after his return to Normandy Henry was invested by his father with the duchy (1150). He succeeded to Anjou in 1151; next year he acquired the duchy of Aquitaine by marriage. Stephen struggled hard to secure the succession for Eustace, his elder son. But he had quarrelled with Rome respecting a vacancy in the see of York; the pope forbade the English bishops to consecrate Eustace (1151); and there was a general unwillingness to prolong the civil war. Worn out by incessant conflicts, the king bowed to the inevitable when Henry next appeared in England (1153). Negotiations were opened; and Stephen's last hesitations disappeared when Eustace was carried off by a sudden illness. Late in 1153 the king acknowledged Henry as his heir, only stipulating that the earldom of Surrey and his private estates should be guaranteed to his surviving son, William. The king and the duke agreed to co-operate for the repression of anarchy; but Stephen died before this work was more than begun (Oct. 1154).

On his great seal Stephen is represented as tall and robust, bearded, and of an open countenance. He was frank and generous; his occasional acts of duplicity were planned reluctantly and never carried to their logical conclusion. High spirited and proud of his dignity, he lived to repent, without being able to undo, the ruinous concessions by which he had conciliated supporters. In warfare he showed courage, but little generalship; as a statesman he failed in his dealings with the Church, which he alternately humoured and thwarted. He was a generous patron of religious foundations; and some pleasing anecdotes suggest that his personal character deserves more commendation than his record as a king.

See the *Gesta Stephani*, Richard of Hexham, Ælred of Rievaux' *Relatio de Standardo*, and the chronicle of Robert de Torigni, all in R. Howlett's *Chronicles of the Reigns of Stephen*, &c. Stubbs (London, 1889); John of Worcester's *Continuation of Florence*, ed. J. H. Weaver (Oxford, 1908); the *Peterborough Chronicle*, ed. C. Plummer (1892–1899). Of modern works see Miss K. Norgate's *England under the Angevin Kings*, vol. i. (London, 1887); O. Rössler's *Kaiserin Mathilde* (Berlin, 1897); J. H. Round's *Geoffrey de Mandeville* (London, 1892); H. W. C. Davis's "The Anarchy of Stephen's Reign" in *Eng. Hist. Review* for 1903. (H. W. C. D.)

STEPHEN, the name of nine popes.

Stephen I., bishop of Rome from about 254 to 257, followed Lucius I. He withdrew from church fellowship with Cyprian and certain Asiatic bishops on account of their views as to the necessity of rebaptizing heretics (Euseb. *H. E.* vii. 5; Cypr. *Epp.* 75). He is also mentioned as having insisted on the restoration of the bishops of Merida and Astorga, who had been deposed for unfaithfulness during persecution but afterwards had repented. He is commemorated on August 2. His successor was Sixtus II.

Stephen II., pope from March 752 to April 757, was in deacon's orders when chosen to the vacant see within twelve days after the death of Zacharias.[1] The main difficulty of his pontificate was in connexion with the aggressive attitude of Aistulf, king of the Lombards. After unsuccessful embassies to Aistulf himself and appeals to the emperor Constantine, he, though in feeble health, set out to seek the aid of Pippin, by whom he was received in the neighbourhood of Vitry le Brulé in the beginning of 754. He spent the winter at St Denis. The result of his negotiations was the Frankish invasion of Aistulf's territory and the famous "donation" of Pippin. The death of Stephen took place not long after that of Aistulf. He was succeeded by Paul I.

[1] A priest named Stephen, elected before him, died three days after, without having received the episcopal consecration.

Stephen III., pope from the 7th of August 768 to the 3rd of February 772, was a native of Sicily, and, having come to Rome during the pontificate of Gregory III., gradually rose to high office in the service of successive popes. On the deposition of Constantine II. Stephen was chosen to succeed him. Fragmentary records are preserved of the council (April 769) at which the degradation of Constantine was completed, certain new arrangements for papal elections made, and the practice of image-worship confirmed. Stephen inclined to the Lombard rather than to the Frankish alliance. He was succeeded by Adrian I.

Stephen IV., pope from June 816 to January 817, succeeded Leo III. He did not continue Leo's policy, which was more favourable to the clergy than to the lay aristocracy. Immediately after his consecration he ordered the Roman people to swear fidelity to Louis the Pious, to whom he found it prudent to betake himself personally in the following August. After the coronation of Louis at Reims in October he returned to Rome, where he died in the beginning of the following year. His successor was Paschal I.

Stephen V., pope from 885 to 891, succeeded Adrian III., and was in turn succeeded by Formosus. In his dealings with Constantinople in the matter of Photius, as also in his relations with the young Slavonic Church, he pursued the policy of Nicholas I. His Italian policy wavered between his desire for the protection of the German king Arnulf against Guy of Spoleto, king of Italy, and fear of offending Guy. Guy was crowned emperor in 891.

Stephen VI., pope from May 896 to July–August 897, succeeded Boniface VI., and was in turn followed by Romanus. His conduct towards the remains of Formosus, his last predecessor but one (see Formosus) excited a tumult, which ended in his imprisonment and death by strangling.

Stephen VII. (January 929 to February 931) and Stephen VIII. (July 939 to October 949) were virtually nonentities, who held the pontificate while the real direction of the pontifical state was in the hands of Marozia and, afterwards, of her son Alberic, senator of the Romans.

Stephen IX., pope from August 1057 to March 1058, succeeded Victor II. (Gebhard of Eichstädt). His baptismal name was Frederick, and he was a younger brother of Godfrey, duke of Upper Lorraine, marquis of Tuscany (by his marriage with Beatrice, widow of Boniface, marquis of Tuscany). Frederick, who had been raised to the cardinalate by Leo IX., acted for some time as papal legate at Constantinople, and was with Leo in his unlucky expedition against the Normans. He shared his brother's fortunes, and at one time had to take refuge from Henry III. in Monte Cassino. Five days after the death of Victor II. (who had made him cardinal-priest and abbot of Monte Cassino) he was chosen to succeed him. He showed great zeal in enforcing the Hildebrandine policy as to clerical celibacy, and was planning the expulsion of the Normans from Italy and the elevation of his brother to the imperial throne when he was seized by a severe illness. He died at Florence on the 29th of March 1058.

STEPHEN I. [St Stephen] (977–1038), king of Hungary, was the son of Geza, duke of Hungary, and of Sarolta, one of the few Magyar Christian ladies, who obtained the best teachers for her infant son. These preceptors included the German priest Bruno, the Czech priest Radla, and an Italian knight, Theodate of San Severino, who taught him arms and letters (a holograph epistle by Stephen existed in the Vatican Library as late as 1513). In 996 Stephen married Gisela, the daughter of Duke Henry II. of Bavaria, and in the following year his father died and the young prince was suddenly confronted by a formidable pagan reaction under Kupa in the districts between the Drave and Lake Balaton. Stephen hastened against the rebels, bearing before him the banner of St Martin of Tours, whom he now chose to be his patron saint, and routed the rebels at Veszprem (998), a victory from which the foundation of the Hungarian monarchy must be dated, for Stephen assumed the royal title immediately afterwards. In 1001 his envoy Asztrik obtained Pope Silvester II.'s confirmation of this act of sovereignty. Silvester at the same time sent Stephen a consecrated crown, and approved of the erection of an independent Hungarian church, divided into the two provinces of Esztergom and Bâcs. But the power of pagan Hungary could not be broken in a day. The focus of the movement was the Maros region, where the rebel Ajtony built the fortress of Marosvár. The struggle proceeded for more than twenty-five years, the difficulties of Stephen being materially increased by the assistance rendered to the rebels by the Greek emperors, his neighbours since their reconquest of Bulgaria. As early as 1015 Stephen had appointed the Italian priest Gellert bishop of Maros, but he was unable to establish the missionary in his see till 1030. The necessity of christianizing his heathen kingdom by force of arms engrossed all the energies of Stephen and compelled him to adopt a pacific policy towards the emperors of the East and West. When the emperor Conrad, with the deliberate intention of subjugating Hungary, invaded it in 1030, Stephen not only drove him out, but captured Vienna (now mentioned for the first time) and compelled the emperor to cede a large portion of the Ostmark (1031). Of the five sons borne to him by Gisela, only Emerich reached manhood, and this well-educated prince was killed by a wild boar in 1031. Stephen thereupon appointed as his successor his wife's nephew Peter Orseolo, who settled in Hungary, where his intrigues and foreign ways made him extremely unpopular. Stephen died at his palace at Esztergom in 1038 and was canonized in 1083. For an account of his epoch-making reforms see HUNGARY: *History*.

See Gyula Pauler, *History of the Hungarian Nation*, vol. i. (Hung.; Pest, 1893); Lajos Balics, *History of the Roman Catholic Church in Hungary*, vol. i. (Hung.; Pest, 1885); Antal Pór, *Life of St Stephen* (Hung.; Pest, 1871); János Karácsonyi, *Documents issued by Stephen I.* (Hung.; Pest, 1892), idem, *Life of St Gellert* (Hung.; Pest, 1887); E. Horn, *St Etienne, roi apostolique de Hongrie* (Paris, 1899); W. J. Winkler de Kétrszynski, *Vita sancti Stephani* (Cracow, 1897). (R. N. B.)

STEPHEN V. (1239–1272), king of Hungary, was the eldest son of Béla IV., whom he succeeded in 1270. As crown prince he had exhibited considerable ability, but also a disquieting restlessness and violence. In 1262 he compelled his father, whom he had assisted in the Bohemian War, to surrender twenty-nine counties to him, so that Hungary was virtually divided into two kingdoms. Not content with this he subsequently seized the southern banate of Macso, which led to a fresh war between father and son in which the latter triumphed. In 1268 he undertook an expedition against the Bulgarians, conquering the land as far as Tirnova and styling himself henceforth king of Bulgaria. Stephen was a keen and circumspect politician, and for his future security contracted, during his father's lifetime, a double[1] matrimonial alliance with the Neapolitan princes of the House of Anjou, the chief partisans of the pope. He certainly needed exterior support; for on his accession to the Hungarian throne, as he himself declared, every one was his enemy. This hostility was due to the almost universal opinion of western Europe that Stephen was a semi-pagan. His father had married him while still a youth (*c.* 1255) to Elizabeth, daughter of the Kumanian chieftain Köteny, with a view to binding the Kumanians (who could put in the field 16,000 men; see HUNGARY: *History*) more closely to the dynasty in the then by no means improbable contingency of a second Tatar invasion. The lady was duly baptized and remained a Christian; but the adversaries of Stephen, especially Ottakar II. of Bohemia, affected to believe that Stephen was too great a friend of the Kumanians to be a true Catholic. Ottakar endeavoured, with the aid of the Magyar malcontents, to conquer the western provinces of Hungary, but after some successes was utterly routed by Stephen in 1271 near Mosony, and by the peace of Pressburg, the same year, relinquished all his conquests. Stephen died suddenly on the 6th of August 1272, just as he was raising an army to recover his kidnapped infant son Ladislaus from the hands of his rebellious vassals.

See Ignacz Acsády, *History of the Hungarian Realm*, vol. i. (Hung.; Budapest, 1903). (R. N. B.)

[1] Charles, the son of Charles of Anjou, was to marry Stephen's daughter Maria, while Stephen's infant son Ladislaus was to marry Charles's daughter Elizabeth. Another of his daughters, Anna, married the Greek emperor Andronicus Palaeologus.

STEPHEN, SIR JAMES (1789–1859), English historian, was the son of James Stephen, master in chancery, author of *The Slavery of the West India Colonies* and other works, and was born in London on the 3rd of January 1789. He was educated at Trinity Hall, Cambridge, graduating B.A. in 1812, after which he studied for the bar and was called at Lincoln's Inn. He obtained an extensive practice as a chancery barrister, being ultimately counsel to the colonial department and counsel to the board of trade. In 1834 he became assistant under-secretary for the colonies, and shortly afterwards permanent under-secretary. On his retirement in 1847 he was made a knight commander of the Bath. In 1849 he was appointed regius professor of modern history in the university of Cambridge, having already distinguished himself by his brilliant studies in ecclesiastical biography contributed to the *Edinburgh Review*, which were published that year under the title *Essays in Ecclesiastical Biography and Other Subjects*; a 4th edition, with a short memoir, appeared in 1860. He was also the author of *Lectures on the History of France* (2 vols., 1851; 3rd ed., 1857), and *Desultory and Systematic Reading*, a lecture (1853). He died at Coblentz on the 15th of September 1859.

STEPHEN, SIR JAMES FITZJAMES, BART. (1829–1894), English lawyer, judge and publicist, was born in London on the 3rd of March 1829, the third child and second son of Sir James Stephen (*q.v.*). Fitzjames Stephen was for three years (1842–1845) at Eton, and for two years at King's College, London. In October 1847 he entered at Trinity College, Cambridge. Notwithstanding exceptional vigour in mind and body, he did not attain any of the usual scholastic or athletic distinctions. The only studies then seriously prosecuted in the university course were mathematics and classics. Neither of these attracted him in their academical forms, nor did he care for competitive sport. But his Cambridge time was fruitful in other ways. He was already acquainted with Sir Henry Maine (*q.v.*), six years his senior, and then newly appointed to the chair of civil law. This acquaintance now ripened into a perfect friendship, which ended only with Maine's death in 1888. No two men's intellectual tempers ever presented a stronger contrast. As Stephen himself said, it took them a long time to know when they really agreed. Maine was subtle, swift and far-reaching; Stephen was massive, downright, indefatigable and sincere even to unnecessary frankness. Their qualities were an almost exact complement of one another, but neither of them would take opinions on trust, or acquiesce in common-place methods of avoiding difficulties; and it might have been said of either of them without exaggeration that, if all his technical and professional requirements could be taken away, a born man of letters would be left. By Maine's introduction, Stephen became a member of the Cambridge society known as the Apostles, in form not very different from many other essay societies, in substance a body with an unformulated but most individual tradition of open-mindedness and absolute mutual tolerance in all matters of opinion. Perhaps the golden age of the society was a few years before Stephen's election, but it still contained a remarkable group of men who afterwards became eminent in such different ways as, for instance, James Clerk Maxwell and Sir William Harcourt. Stephen formed friendships with some of its members, which were as permanent, though in few cases so little subject to external interruption, as his intimacy with Maine. Probably the Apostles did much to correct the formalism inevitably incident to the evangelical traditions of the first Sir James Stephen's household.

After leaving Cambridge, Fitzjames Stephen, having practically to choose between the Church and the bar, decided for the bar. He was called in 1854, after the usual haphazard preparation which was then (and still practically is) considered in England alone, and even in England for one kind of learning alone, a sufficient introduction to the duties of a learned profession. His own estimate of his strictly professional success, written down in later years, was that in spite of such training as he could get, rather than because of it, he became a moderately successful advocate and a rather distinguished judge. As to the former branch of the statement, it is correct but ambiguous to those who do not know the facts. Stephen's work was always distinguished in quality, though his amount of business was never great in quantity. After his return from India and before he became a judge he had what is called a good practice, but still not a large one. In his earlier years at the bar he was attracted by the stop-gap of journalism. It was no common journalism, however, that enlisted Stephen as a contributor to the *Saturday Review* when it was founded in 1855. He was in company with Maine, Sir William Harcourt, G. S. Venables (a writer of first-rate quality who never set his name to anything), C. S. C. Bowen, E.A. Freeman, Goldwin Smith and others whose names have since become well known. Strangely enough, the first and the last books published by Stephen were selections from his papers in the *Saturday Review* (*Essays by a Barrister*, 1862, anonymous; *Horae sabbaticae*, 1892). These volumes embodied the results of his studies among publicists and theologians, chiefly English, from the 17th century onwards. They never professed to be more than the occasional products of an amateur's leisure, but they were of greater value when they were first published than is easily recognized at this day by a generation familiar with the resources of later criticism.

For exactly three years (1858–1861) Stephen served as secretary to a royal commission on popular education, which was more fortunate than most commissions in having prompt effect given to its conclusions. In 1859 he was appointed recorder of Newark. In 1863 he published his *General View of the Criminal Law of England* (not altogether superseded by the second edition of 1890, which was practically a new book). This was really the first attempt that had been made since Blackstone to explain the principles of English law and justice in a literary form, and it had a thoroughly deserved success. All this time Stephen kept up a great deal of miscellaneous writing, and the foundation of the *Pall Mall Gazette* in 1865 gave him a new opening. He was one of the principal contributors for some years, and an occasional one till he became a judge. So far he was a literary lawyer, also possibly with chances (diminished by his vehement dislike for party politics) of regular professional advancement, possibly not free from the temptation to turn wholly to literature. The decisive point of his career was in the summer of 1869, when he accepted the post of legal member of council in India. Fitzjames Stephen's friend Maine was his immediate predecessor in this office. Guided by Maine's comprehensive genius, the government of India had entered on a period of systematic legislation which was to last about twenty years. The materials for considerable parts of this plan had been left by Maine in a more or less forward condition. Stephen had the task of working them into their definite shape and conducting the bills through the Legislative Council. This he did with wonderful energy, with efficiency and workmanship adequate to the purpose, if sometimes rough according to English notions, and so as to leave his own individual mark in many places. The Native Marriages Act of 1872 was the result of deep consideration on both Maine's and Stephen's part. The Contract Act had been framed in England by a learned commission (apparently not having much special Indian information, or not much regarding that which it had), and the draft was materially altered in Stephen's hands before, also in 1872, it became law. The Evidence Act of the same year was entirely Stephen's own. It not only consolidated the rules of judicial proof, but endeavoured to connect them by legislative authority with a logical theory of probability set forth in the act itself. This part of the act has been criticized both as to the principle (which, indeed, seems open to much doubt) and as to the success of the draftsman in applying it. At any rate it is characteristic of Stephen's anxiety never to shirk a difficulty. To some extent the Contract Act may be charged with similar over-ambition; but its more practical defects are evidently due to the acceptance by the original framers of unsatisfactory statements which, coming to India with a show of authority, naturally escaped minute criticism amid the varied business of the legislative department. If the success of the later Anglo-Indian Codes has not been quite so complete as that of the Penal Code, they have, on the whole, done excellent service, and they are at least as good as any European codification prior to the very recent achievements of scientific lawyers in Italy and Germany. Besides the special work of legislation, Stephen had to attend to the current administrative business of his department, often heavy enough to occupy the whole of an ordinary able man's attention, and he took his full share in the general deliberations of the viceroy's council. His last official act was the publication of a minute on the administration of justice which pointed the way to reforms not yet fully realized, and is still most valuable for every one who wishes to understand the judicial system of British India. Stephen, mainly for family reasons, came home in the spring of 1872. During the voyage he made a pastime of meditating and writing a series of articles which took the form of his book entitled *Liberty, Equality, Fraternity* (1873–1874)—a protest against J. S. Mill's neo-utilitarianism which was really in the nature of an appeal from the new to the old utilitarians, if any such were left, or perhaps rather to Hobbes. It was, however, too individual to be systematic, and made no serious attempt at reconstruction.

Indian experience had supplied Stephen with the motive for his next line of activity, which future historians of the common law may well regard as his most eminent title to remembrance. The government of India had been driven by the conditions of the Indian judicial system to recast a considerable part of the English law which had been informally imported. Criminal law procedure, and a good deal of commercial law, had been or were being put in a shape intelligible to civilian magistrates, and fairly within the comprehension of any intelligent man who would give a moderate amount of pains to mastering the text of the new codes. The rational substance of the law had been preserved, while the disorder and the excessive technicalities were removed. Why should not the same procedure be as practicable and profitable in England? It was Bentham's ideal of codification, to be put in practice with the knowledge of actual business and legal habits, and the lack of which had made Bentham's plans unworkable. For the next half-dozen years Fitzjames Stephen was an ardent missionary in this cause. The mission failed for the time as to the specific undertakings in which Stephen made his experiments, but it had a large indirect success which has not yet been adequately recognized. Stephen published, by way of private exposition, digests in code form of the law of evidence and the criminal law. There were transient hopes of an evidence act being brought before parliament, and in 1878 the digest of criminal law became a ministerial bill. This was referred to a very strong judicial commission, with the addition of Stephen himself: the revised bill was introduced in 1879 and 1880. It dealt with procedure as well as substantive law, and provided for a court of criminal appeal (after several years of judicial experience Stephen changed his mind as to the wisdom of this). However, no substantial progress was made. In 1883 the part relating to procedure was brought in separately, and went to the grand committee on law, who found there was not time to deal with it satisfactorily in the course of the session. Criminal appeal has since (1907) been dealt with; otherwise nothing has been done with either part of the draft code since. The historical materials which Stephen had long been collecting took permanent shape the same year (1883) in the *History of the Criminal Law of England*, which, though not free from inequalities and traces of haste, must long remain the standard work on the subject. A projected digest of the law of contract (which would have been much fuller than the Indian Code) fell through for want of time. Thus, none of Stephen's own plans of English codification took effect. Nevertheless they bore fruit indirectly. Younger men dealt with other chapters of the law in the systematic form of the Anglo-Indian codes; and a digest of the law of partnership by Sir Frederick Pollock, and one of the law of negotiable instruments by Sir M. D. Chalmers, who some time afterwards filled the post of legal member of council in India, became the foundation of the Bills of Exchange Act of 1882 and the Partnership Act of 1890. Lord Herschell passed a Sale of Goods Act on similar lines, also drafted by Chalmers, in 1893; and a Marine Insurance Act, prepared in like manner in 1894, finally became law in 1906. Nothing really stands in the way of a practically complete code of maritime and commercial law for the United Kingdom but the difficulty of finding time in the House of Commons for non-contentious legislation; and whenever this is achieved, the result will in substance be largely due to Sir James Stephen's efforts. Meanwhile, in addition to his other occupations, Stephen was an active member of the Metaphysical Society (see KNOWLES), and he carried on an intimate correspondence with Lord Lytton, then viceroy of India, during the critical period of the second Afghan War. In connexion with the Metaphysical Society, and otherwise, Fitzjames Stephen took an active interest in many topics of current controversy. This led him to produce a great number of occasional articles, of which a list may be found at the end of Sir Leslie Stephen's *Life.* The matters dealt with covered a wide field, from modern history and politics, with a predilection for India, to philosophy, but the prevailing mood was theologico-political. All these writings were forcible expositions of serious and thoroughly definite views, and therefore effective at the time and valuable even to those who least agreed with them. As to the philosophical part of them, the grounds of discussion were shifting then, and have continued to shift rapidly. Much of Stephen's vigorous polemic has already incurred the natural fate of becoming as obsolete as the arguments against which it was directed. Pure metaphysical speculation, as an intellectual exercise, had little attraction for him; and, though he was fully capable of impartial historical criticism, he seldom applied it outside the history of law.

In 1877 Stephen was made a Knight Commander of the Star of India, and in 1878 he received the honorary degree of D.C.L. at Oxford. Early in 1879 he was appointed judge of the queen's bench division. He held that office a little more than eleven years. The combination of mature intellectual patience and critical subtlety which marked the great masters of the common law was not his, and it cannot be said that he made any considerable addition to the substance of legal ideas. His mind was framed for legislation rather than for systematic interpretation and development. Therefore he can hardly be called a great judge; but he was a thoroughly just and efficient one; and if none of his judgments became landmarks of the law, very few of them were wrong. Especially in criminal jurisdiction, he was invariably anxious that moral as well as legal justice should be done. He found time, in 1885, to produce a book on the trial of Nuncomar, for the purpose of rehabilitating Sir Elijah Impey's memory against the attack made on him in Macaulay's essay on Warren Hastings, which for most English readers is the first and last source of information on the whole matter. Mr G. W. Forrest's later research in the archives of the government of India had tended to confirm the judicial protest, at any rate as regards Macaulay's grosser charges.

The one thing of which Stephen was least capable—among other things possible to a good man and a good citizen—was sparing himself. He had one or two warnings which a less energetic man would have taken more seriously. In the spring of 1891 his health broke down, the chief symptom being sudden lapses of memory of which he was himself quite unconscious. In obedience to medical advice he resigned his judgeship in April, and was created a baronet. He lived in retirement till his death on the 11th of March 1894, having filled a not very long life with a surprising amount of work, of which a large proportion was of permanent value. Perhaps the most individual part of Stephen's character was his absolute sincerity. He would not allow himself even innocent dissimulation; and this gave to those who knew him but slightly an impression of hardness which was entirely contrary to his real nature. Sir James Stephen married Mary Richenda Cunningham in 1855. On his death his eldest son, Herbert, succeeded to the baronetcy. A second son of brilliant literary promise, James Kenneth Stephen (1859–1892), died in his father's lifetime: his principal literary achievements consisted in two small volumes of verse—*Lapsus calami* and *Quo Musa tendis,* the former of which went through five editions in a very short time. The third son, Mr H. L. Stephen, was appointed in 1901 judge of the High Court of Calcutta.

See Sir Leslie Stephen, *Life of Sir James Fitzjames Stephen* (London, 1895), with bibliographical appendix, a model Biography; same author's article in the *Dict. Nat. Biog.*; *Letters with biographical Notes,* by his daughter, Caroline Emelia Stephen (1907). See also Sir C. P. Ilbert, "Sir James Stephen as a Legislator," *Law Quart. Rev.* x. 222. (F. Po.)

STEPHEN, SIR LESLIE (1832–1904), English biographer and literary critic, grandson of James Stephen (1758–1832), master in chancery, a friend of Wilberforce, and author of a book called *Slavery Delineated,* and son of Sir James Stephen (1789–1859), colonial under-secretary for many years, and author of *Essays on Ecclesiastical Biography,* was born at Kensington Gore on the 28th of November 1832. At his father's house he saw a good deal of the Abolitionists and other members of the Clapham sect, and the Macaulays, James Spedding, Sir Henry Taylor and Nassau Senior were intimate friends of his family. After education at Eton, King's College, London, and Trinity Hall, Cambridge, where he graduated B.A. (20th wrangler) 1854, M.A. 1857, Stephen remained for several years a fellow and tutor of his college. He has recounted the experiences of a resident fellow at that period in a delightful chapter in his *Life of Fawcett* as well as in some less formal *Sketches from Cambridge: By a Don* (1865). These sketches were reprinted from the *Pall Mall Gazette,* to the proprietor of which, George Smith, he had been introduced by his brother (Sir) James Fitzjames Stephen. It was at Smith's house at Hampstead that Stephen met his first wife, Harriet Marion (d. 1875), daughter of W. M. Thackeray; after her death he married Julia Prinsep, widow of Herbert Duckworth. While still a fellow he had taken holy orders, which he relinquished in March 1875 upon the passing of the Clerical Disabilities Act. In the meantime (after a visit to America, where he formed lasting friendships with Lowell and Eliot Norton) he settled in London, and wrote largely, not only for the *Pall Mall Gazette* and the *Saturday Review,* but also for *Fraser, Macmillan,* the *Fortnightly* and other periodicals. He was already known as an ardent mountaineer, as a contributor to *Peaks, Passes and Glaciers* (1862), and as one of the earliest presidents of the Alpine Club, when in 1871, as a vindication in some sort of the mountaineering mania, and as a commemoration of his own first ascents of the Schreckhorn and Rothhorn, he published his fascinating *Playground of Europe* (republished with additions, 1894). In the same year he was appointed editor of the *Cornhill Magazine,* the reputation of which he maintained by enlisting R. L. Stevenson, Thomas Hardy, W. E. Norris, Henry James and James Payn among his contributors. During the eleven years of his editorship, in addition to three sharp and penetrating volumes of critical studies, reprinted mainly from the *Cornhill* under the title of *Hours in a Library* (1874,1876 and 1879), and some *Essays on Freethinking and Plain Speaking* (1873 and 1897, with introductory essays by J. Bryce and H. Paul), which included the very striking "A Bad Five Minutes in the Alps" (reprinted from *Fraser* and the *Fortnightly* in 1873), he made two valuable contributions to philosophical history and theory, *The History of English Thought in the Eighteenth Century* (1876 and 1881) and *The Science of Ethics* (1882); the second of these was extensively adopted as a textbook on the subject. The first was generally recognized as an important addition to philosophical literature, and led immediately to Stephen's election at the Athenaeum Club in 1877. In 1879 he set on foot a Sunday Walking Club, which contained well-known names, among them Sir F. Pollock, F. W. Maitland, Croom Robertson and Cotter Morison.

In the autumn of 1882 he abandoned the direction of the *Cornhill* to James Payn, having accepted the more responsible duty of the editor of the *Dictionary of National Biography*, for the first planning and conception of which he was largely responsible. The first volume of the *Dictionary* was published in January 1885, and twenty quarterly volumes followed under Stephen's sole editorship. Five volumes were then published under the joint editorship of Leslie Stephen and of Mr Sidney Lee, whom he had appointed as his assistant in March 1883. Early in 1891, after eight and a half years' service, Stephen, whose health had been impaired by the labour inseparable from the direction of such an undertaking, resigned the responsibility to his coadjutor. Not a trained historian, he often found it difficult to curb his impatience with Carlyle's old enemy Dryasdust. Fortunately for the success of the work, re-established health enabled him to remain a contributor to the *Dictionary*. Among his lives are those of Addison, Bolingbroke, Burns, Charlotte Brontë, Byron, Carlyle, Marlborough, Coleridge, Defoe, Dickens, Dryden, Fielding, George Eliot, Gibbon, Goldsmith, Hobbes, Hume, Johnson, Landor, Locke, Macaulay, the two Mills, Milton, Pope, Scott, Swift, Adam Smith, Thackeray, Warburton, Wordsworth and Young. Many of these are salted with irony, and most of them are characterized by felicitous phrases, by frequent flashes of insight (especially of the sardonic order), and by the good fortune which attends a consummate artist in his special craft. His particular style of treatment is more appropriate, perhaps, to the self-complacent worthies of the 18th century than to quietists such as Law and Wordsworth; but where space demands that a character should be inscribed upon a cherry-stone, Stephen seldom if ever failed to rise to the occasion. For the "English Men of Letters" he wrote lives of Swift, Pope and Johnson—the last well described as "the peerless model of short biographies"—and subsequently George Eliot and Hobbes (1904). During his tenure of the editorship of the *Dictionary* he was appointed first Clark lecturer at Cambridge (1883), and lectured upon his favourite period—Berkeley, Mandeville, Warburton and Hume; a few years later, upon one of several visits to his intimate friends and old correspondents, Norton and Lowell, he received (1890) a doctor's degree from Harvard University. After Lowell's death in 1891 Stephen was mainly instrumental in having a memorial window placed in Westminster Abbey.

In 1885 he brought out his standard *Life of Fawcett*, in 1893 his *Agnostic's Apology and other Essays*, and in 1895 the *Life* of his brother, Sir James Fitzjames Stephen, which, less essayistic in manner than the *Life of Fawcett*, contains his most finished biographical work. In the same year, in succession to Lord Tennyson, Stephen was elected president of the London Library, and shortly afterwards appointed a trustee of the National Portrait Gallery. Some of his experiences as an editor were embodied in *Studies of a Biographer*, issued in 1898, while in 1900 appeared an important work which he had long had in preparation in continuation of his *English Thought in the Eighteenth Century*, entitled *The English Utilitarians*, being full-length studies of Bentham and the two Mills. As a thinker Leslie Stephen showed himself consistently a follower of Hume, Bentham, the Mills and G. H. Lewes, but he accepted the older utilitarianism only as modified by the application of Darwinian principles, upon lines to some extent indicated by Herbert Spencer (see ETHICS). The negative character of his teaching, his anti-sacerdotal bias, his continual attitude of irony, and even the very subtlety of his thought, have co-operated to retard the recognition of his value as rivalled only by Bagehot among critics of the incisive school. For blowing the froth off the flagon of extravagant or inflated eulogy he certainly met no equal in his generation. Voluminous as his work is, it is never dull. While making self-depreciation a fine art, and perpetually laughing in his sleeve at the literary bias and the literary foible, he fulfilled with exceptional conscience the literary duty of never writing below his best. Brought up in a rigid and precise school which scorned all pretence and discouraged enthusiasm as the sign of an ill-regulated mind, he produced no *magnum opus*, but he enriched English literature with a fine gallery of literary portraits, not all of them perhaps wholly accurate, but restrained, concise and always significant. Besides being a member of the Metaphysical Society, he was for some years president of the Ethical Society (many of his addresses to which were published as *Social Rights and Duties* in 1896). In addition to his separate works, he superintended a large number of editions, among them Clifford's *Essays* (1879), Fielding (1882), Richardson (1883), Payn's *Backwater of Life* (1899), and J. R. Green's *Letters* (1901). In 1896 he wrote a memoir of his friend James Dykes Campbell for the second edition of Campbell's *Coleridge*, and in 1897 he contributed a preface to the English translation of *The Early Life of Wordsworth*, by M. Legouis.

His name was included in the Coronation honours list of June 1902, when he was made K.C.B. In December of this year he had to undergo an operation, after which his health began to wane rapidly. In 1903 his Ford lectures, one last luminous talk about the 18th century, were delivered by his nephew, H. L. Fisher. He told a nurse that his enjoyment of books had begun and would end with Boswell's *Johnson*. Like Johnson, under a brusque exterior and a coltish temper, he concealed a sympathetic and humorous soul. In spite of "natural sorrows"—the loss of two much loved wives, he pronounced his life to have been a happy one. He died at his house, 22 Hyde Park Gate, on the 22nd of February 1904, and his remains were buried at Golders Green. A Leslie Stephen memorial lectureship was founded at Cambridge in 1905. Under an austere form and visage Stephen was in reality the soul of susceptibility and of an almost freakish fun. This is shown very clearly in the fantastic marginal drawings with which he delighted to illustrate his life for the amusement of young people.

See *Life and Letters*, by F. W. Maitland (1906); and *Dictionary of National Biography*, postscript to Statistical Account in the 1908–1909 reissue. (T. SE.)

STEPHEN BAR SŪDHAILĒ, a Syrian mystical writer, who flourished about the end of the 5th century A.D. The earlier part of his career was passed at Edessa, of which he may have been a native.[1] He afterwards removed to Jerusalem, where he lived as a monk, and endeavoured to make converts to his peculiar doctrines, both by teaching among the community there and by letters to his former friends at Edessa. He was the author of commentaries on the Bible and other theological works. Two of his eminent contemporaries, the Monophysites Jacob of Sĕrūgh (451–521) and Philoxenus of Mabbōgh (d. 523), wrote letters in condemnation of his teaching. His two main theses which they attacked were (1) the limited duration of the future punishment of sinners, (2) the pantheistic doctrine that "all nature is consubstantial with the Divine essence"—that the whole universe has emanated from God, and will in the end return to and be absorbed in him.

The fame of Stephen as a writer rests on his identification with the author of a treatise which survives in a single Syriac MS. (Brit. Mus. Add. MSS. 7189, written mainly in the 13th century), "The book of Hierotheus on the hidden mysteries of the house of God." The work claims to have been composed in the 1st century A.D. by a certain Hierotheus who was the disciple of St Paul and the teacher of Dionysius the Areopagite. But, like the works which pass under the name of Dionysius, it is undoubtedly pseudonymous, and most Syriac writers who mention it attribute it to Stephen. An interesting discussion and summary of the book have been given by A. L. Frothingham (*Stephen bar Sudhaili*, Leiden, 1886), but the text is still (1910) unpublished. From Frothingham's analysis we learn that the work consists of five books; after briefly describing the origin of the world by emanation from the Supreme Good it is mainly occupied with the description of the stages by which the mind returns to union with God, who finally becomes "all in all." "To describe the contents in a few words: at the beginning we find the statement regarding absolute existence, and the emanation from primordial essence of the spiritual and material universes: then comes, what occupies almost the entire work, the experience of

[1] He is described as "Stephen the Edessene" in the 8th-century MS. which contains the letter of Philoxenus to Abraham and Orestes.

the mind in search of perfection during this life. Finally comes the description of the various phases of existence as the mind rises into complete union with, and ultimate absorption into, the primitive essence. The keynote to the experience of the mind is its absolute identification with Christ; but the son finally resigns the kingdom unto the Father, and all distinct existence comes to an end, being lost in the chaos of the Good" (Frothingham, p. 92). One of the most curious features of the work is the misguided skill with which the language of the Bible is pressed into the service of pantheistic speculation. In this and other respects the book harmonizes well with the picture of Stephen's teaching afforded by the letter of Philoxenus to the Edessene priests Abraham and Orestes (Frothingham, pp. 28–48). The *Book of Hierotheus* is probably an original Syriac work, and not translated from Greek. Its relation to the Pseudo-Dionysian literature is a difficult question; probably Frothingham (p. 83) goes too far in suggesting that it was prior to all the pseudo-Dionysian writings (cf. Ryssel in *Zeitschrift für Kirchengeschichte*).

The unique MS. in which the book of Hierotheus survives furnishes along with its text the commentary made upon it by Theodosius, patriarch of Antioch (887–896), who appears to have sympathized with its teaching. A rearrangement and abridgment of the work was made by the great Monophysite author Barhebraeus (1226–1286), who expunged or garbled much of its unorthodox teaching. It is interesting to note that the identical copy which he used is the MS. which now survives in the British Museum. (N. M.)

STEPHEN (ISTVÁN) BÁTHORY (1533–1586), king of Poland and prince of Transylvania, the most famous member of the Somlyó branch of the ancient Báthory family, now extinct, but originally almost coeval with the Hungarian monarchy. István Báthory spent his early years at the court of the emperor Ferdinand, subsequently attached himself to Janos Zapolya, and won equal renown as a valiant lord-marcher, and as a skilful diplomatist at the imperial court. Zapolya rewarded him with the voivodeship of Transylvania, and as the loyal defender of the rights of his patron's son, John Sigismund, he incurred the animosity of the emperor Maximilian, who kept him in prison for two years. On the 25th of May 1571, on the death of John Sigismund, Báthory was elected prince of Transylvania by the Hungarian estates, in spite of the opposition of the court of Vienna and contrary to the wishes of the late prince, who had appointed Gaspar Békesy his successor. Békesy insisting on his claims, a civil war ensued in which Báthory ultimately drove his rival out of Transylvania (1572). On the flight of Henry of Valois from Poland in 1574, the Polish nobility, chiefly at the instigation of the great chancellor, Jan Zamoyski, elected Báthory king of Poland (1575) in opposition to the emperor Maximilian, the candidate of the senate. On hearing of his altogether unexpected elevation, Báthory summoned the Transylvanian estates together at Medgyes and persuaded them to elect his brother Christopher prince in his stead; then hastening to Cracow, he accepted the onerous conditions laid upon him by the Polish Diet, espoused the princess Anne, the elderly sister of the last Jagiello, Sigismund II., and on the 1st of May was crowned with unprecedented magnificence. At first his position was extremely difficult; but the sudden death of the emperor Maximilian at the very moment when that potentate, in league with the Muscovite, was about to invade Poland, completely changed the face of things, and though Stephen's distrust of the Habsburgs remained invincible, he consented at last to enter into a defensive alliance with the empire which was carried through by the papal nuncio on his return to Rome in 1578. The leading events of Stephen Báthory's glorious reign can here only be briefly indicated. All armed opposition collapsed with the surrender of Danzig. "The Pearl of Poland," encouraged by her immense wealth, and almost impregnable fortifications, as well as by the secret support of Denmark and the emperor, had shut her gates against the new monarch, and was only reduced (Dec. 16, 1577) after a six months' siege, beginning with a pitched battle beneath her walls in which she lost 5000 of her mercenaries. Danzig was compelled to pay a fine of 200,000 guldens, but her civil and religious liberties were wisely confirmed. Stephen was now able to devote himself to foreign affairs. The difficulties with the sultan were temporarily adjusted by a truce signed on the 5th of November 1577; and the Diet of Warsaw was persuaded to grant Stephen subsidies for the inevitable war against Muscovy. Two campaigns of wearing marches, and still more exhausting sieges ensued, in which Báthory, although repeatedly hampered by the parsimony of the Diet, was uniformly successful, his skilful diplomacy at the same time allaying the suspicions of the Porte and the emperor. In 1581 Stephen penetrated to the very heart of Muscovy, and, on the 22nd of August, sat down before the ancient city of Pskov, whose vast size and imposing fortifications filled the little Polish army with dismay. But the king, despite the murmurs of his own officers, and the protestations of the papal nuncio, Possevino, whom the curia, deluded by the mirage of a union of the churches, had sent expressly from Rome to mediate between the tsar and the king of Poland, closely besieged the city throughout a winter of arctic severity, till, on the 13th of December 1581, Ivan the Terrible, alarmed for the safety of the third city in his empire, concluded peace at Zapoli (Jan. 15, 1582), thereby ceding Polotsk and the whole of Livonia. The chief domestic event of Stephen's reign was the establishment in Poland of the Jesuits, who alone had the intelligence to understand and promote his designs of uniting Poland, Muscovy and Transylvania into one great state with the object of ultimately expelling the Turks from Europe. The project was dissipated by his sudden death, of apoplexy, on the 12th of December 1586.

STEPHENS, ALEXANDER HAMILTON (1812–1883), American statesman, vice-president of the Confederate States during the Civil War, was born in Wilkes (now Taliaferro) county, Georgia, on the 11th of February 1812. He was a weak and sickly child of poor parents, and from his sixth to his fifteenth year, when he was left an orphan, he worked on a farm. After his father's death he went to live with an uncle in Warren county. The superintendent of the local Sunday school sent him to an academy at Washington, Wilkes county, for one year and in the following year (1828) he was sent by the Georgia Educational Society to Franklin College (university of Georgia), where he graduated in 1832. Deciding not to enter the ministry, he paid back the money advanced by the society. He was a schoolmaster for about two years, and then, after studying law for less than four months, was admitted to the bar in 1834. Although delicate in health, his success at the bar was immediate and remarkable. In 1836 he was elected to the Georgia House of Representatives after a campaign in which he was vigorously opposed because he had attacked the doctrine of nullification, and because he had opposed all extra-legal steps against the abolitionists. He was annually re-elected until 1841; in 1842 he was elected to the state Senate, and in the following year, on the Whig ticket, to the National House of Representatives. In this last body he urged the annexation of Texas, chiefly as a means of achieving more power for the South in Congress. He was denounced as a traitor to his party because of his support of annexation, but he later became the leader of the Whig opposition to the war with Mexico. He vigorously supported the Compromise Measures in 1850, and continued to act with the Whigs of the North until they, in 1852, nominated General Winfield Scott for the presidency without Scott's endorsement of the Compromise. Stephens and other Whigs of the South then chose Daniel Webster, but a little later they joined the Democrats. In 1854 Stephens helped to secure the passage of the Kansas-Nebraska Bill. Before the Georgia legislature in November 1860, and again in that state's secession convention in January 1861, he strongly opposed secession, but when Georgia seceded he "followed his state," assisted in forming the new government, and was elected vice-president of the Confederate States. He greatly weakened the position of the Confederacy by a speech delivered at Savannah (March 21, 1861) in which he declared that slavery was its corner-stone. Throughout the war, too, he was so intensely concerned about states' rights and civil liberty that he opposed the exercise of extra-constitutional war powers by President Jefferson Davis lest the freedom for which the South was fighting should be destroyed. His policy was to preserve constitutional government in the South and strengthen the anti-war party in the North by convincing it that the Lincoln administration had abandoned such government; to the same end he urged, in 1864, the unconditional discharge of Federal prisoners in the South. Stephens headed the Confederate commission to the peace conference at Hampton Roads in February 1865. In the following May, after the fall of the Confederacy, he was arrested at his home and taken to Fort Warren, in Boston harbour, where he was confined until the 12th of October. He accepted the result of the war as a practical settlement of the question of secession, exercised a beneficent influence on the negroes of his section, and promoted reconciliation between the North and the South. In 1866 he was elected to the United States Senate, but was not permitted to take his seat. He was a representative in Congress, however, from 1873 to 1882, and was governor of Georgia in 1882–1883, dying in office, at Atlanta, on the 4th of March 1883. He was remarkable for both his moral and physical courage, and in politics was notable for his independence of party. From 1871 to 1873 he edited the *Atlanta Daily Sun*, and he published *A Constitutional View of the Late War between the States* (2 vols., 1868–1870), perhaps the best statement of the southern position with reference to state sovereignty and secession; *The Reviewers Reviewed* (1872), a supplement to the preceding work; and *A Compendium of the History of the United States* (1875; new ed., 1883).

See Louis Pendleton, *Alexander H. Stephens* (Philadelphia, 1908); R. M. Johnston and W. H. Browne, *Life of Alexander H. Stephens* (Philadelphia, 1878; new ed., 1883); and Henry Cleveland, *Alexander H. Stephens in Public and Private, with Letters and Speeches* (Philadelphia, 1866).

STEPHENS, JOHN LLOYD (1805–1852), American traveller, was born on the 28th of November 1805, at Shrewsbury, New Jersey. Having been admitted to the bar, he practised for about eight years in New York City. In 1834, the state of his health rendering it advisable that he should travel, he visited Europe, and for two years made a tour through many countries of that Continent, extending his travels to Egypt and Syria. On his return to New York he published in 1837 (under the name of "George" Stephens) *Incidents of Travel in Egypt, Arabia Petraea, and the Holy Land.* This work was followed next year by the publication of *Incidents of Travel in Greece, Turkey, Russia and Poland.* In 1839 Stephens arranged with Frederick Catherwood of London, who had accompanied him on some of his travels, and illustrated the above-mentioned publications, to make an exploration in Central America, with a view to discovering and examining the antiquities said to exist there. Stephens, meantime, was appointed to a mission to Central America. The joint travels of Stephens and Catherwood occupied some eight months in 1839 and 1840. As the result of these researches Stephens published in 1841 *Incidents of Travels in Central America, Chiapas and Yucatan.* In the autumn of 1841 the two travellers made a second exploration of Yucatan, and a work followed in 1843—*Incidents of Travel in Yucatan.* This work describes the most extensive travels executed till that date by a stranger in the peninsula, and, as the author claims, "contains account of visits to forty-four ruined cities or places in which remains or vestiges of ancient populations were found." It enjoyed a wide popularity, and Stephens was urged to prosecute his researches of American antiquities in Peru, but was disinclined to so distant an expedition. He became a director of the newly-formed American Ocean Steam Navigation Company, which established the first American line of transatlantic steamships. He visited Panama to reconnoitre the ground with a view to the construction of a railway across the isthmus, and, first as vice-president and then as president of the Panama Railway Company, spent the greater part of two years in superintending the project. His health was, however, undermined by exposure to the climate of Central America, and he died at New York on the 10th of October 1852.

STEPHENSON, GEORGE (1781–1848), English engineer, was the second son of Robert Stephenson, fireman of a colliery engine at Wylam, near Newcastle, where he was born on the 9th of June 1781. In boyhood he was employed as a cowherd, and afterwards he drove the ginhorse at a colliery. In his fourteenth year he became assistant fireman to his father at a shilling a day, and in his seventeenth year he was appointed plugman, his duty being to attend to the pumping engine. As yet he was unable to read, but, stimulated by the desire to obtain fuller information regarding the inventions of Boulton and Watt, he began in his eighteenth year to attend a night school and made remarkably rapid progress. In 1801 he obtained a situation as a brakesman, in 1802 he became an engineman at Willington Quay, where he took up watch and clock cleaning, and in 1804 he moved to Killingworth, where in 1812 he was appointed engine-wright at the High Pit at a salary of £100 a year. It was at Killingworth that he devised his miner's safety lamp, first put to practical tests in the autumn of 1815, at the same time that Sir Humphry Davy was producing his lamp. There was considerable controversy as to which of the two men was entitled to the honour of having first made an invention which was probably worked out independently, though simultaneously, by both, and when the admirers of Davy in 1817 presented him with a service of plate, those of Stephenson countered with an address and £1000 early in 1818. In 1813 his interest in the experiments with steam traction that were being carried on at Wylam led him to propose an experiment of the same kind to the proprietors of the Killingworth colliery, and he was authorized to incur the outlay for constructing a "travelling engine" for the tramroads between the colliery and the shipping port 9 m. distant. The engine, which he named "My Lord," ran a successful trial on the 25th of July 1814. In 1822 he succeeded in impressing the advantages of steam traction on the projectors of the Stockton & Darlington railway, who had contemplated using horses for their wagons, and was appointed engineer of the railway, with liberty to carry out his own plans, the result being the opening, on the 27th of September 1825, of the first railway over which passengers and goods were carried by a locomotive. His connexion with the Stockton & Darlington railway led to his employment in the construction of the Liverpool & Manchester railway, which, notwithstanding prognostications of failure by the most eminent engineers of the day, he carried successfully through Chat Moss. When the line was nearing completion he persuaded the directors, who were rather in favour of haulage by fixed engines, to give the locomotive a trial. In consequence they offered a prize of £500 for a suitable machine, and in the competition held at Rainhill in October 1829 his engine "The Rocket" met with approval. On the 15th of September in the following year the railway was formally opened, the eight engines employed having been made at the works started by Stephenson with his cousin Thomas Richardson (1771–1853) and Edward Pease (1767–1858) at Newcastle in 1823. Subsequently Stephenson was engineer of, among others, the Grand Junction, the London & Birmingham (with his son Robert), Manchester to Leeds, Derby to Leeds, Derby to Birmingham, and Normanton to York; but he strongly disapproved of the railway mania which ensued in 1844. He was also consulted in regard to the construction of railways in Belgium and Spain. The last year or two of his life was spent in retirement at Tapton House, Chesterfield, in the pursuit of farming and horticulture, and there he died on the 12th of August 1848. Stephenson was thrice married, his only son Robert being the child of Fanny Henderson, his first wife, who died in 1806. A nephew, George Robert Stephenson, who was born at Newcastle in 1819 and died near Cheltenham in 1905, was placed by him on the engineering staff of the Manchester & Leeds line in 1837, and subsequently constructed many railways in England, New Zealand and Denmark. He was president of the Institution of Civil Engineers in 1876–1877.

See *Story of the Life of George Stephenson*, by Samuel Smiles (1857, new ed., 1873); and Smiles's *Lives of British Engineers*, vol. iii.

STEPHENSON, ROBERT (1803–1859), English engineer, only son of George Stephenson (*q.v.*), was born at Willington Quay on the 16th of October 1803. His father, remembering his own early difficulties, bestowed special care on his son's education, and sent him in his twelfth year to Mr Bruce's school in Percy Street, Newcastle, where he remained about four years. In 1819 he was apprenticed to Nicholas Wood, a coal-viewer at Killingworth, after which he was sent in 1822 to attend the science classes at the university of Edinburgh. On his return he assisted his father in surveying the Stockton & Darlington and Liverpool & Manchester lines, but in 1824 he accepted an engagement in South America to take charge of the engineering operations of the Colombian Mining Association of London. On account of the difficulties of the situation he resigned it in 1827, and returned to England via New York in company with Richard Trevithick, whom he had met in a penniless condition at Cartagena. He then undertook the management of his father's factory in Newcastle, and greatly aided him in the improvement of the locomotives. His practice was not confined to his own country, but extended also to Sweden, Denmark, Belgium, Switzerland, Piedmont and Egypt. In this connexion his most remarkable achievements were his railway bridges, especially those of the tubular girder type. Among his more notable examples are the Royal Border bridge at Berwick-on-Tweed, the High Level bridge at Newcastle-on-Tyne, the Britannia tubular bridge over the Menai Straits, the Conway tubular bridge, and the Victoria tubular bridge over the St Lawrence at Montreal. In 1847 he entered the House of Commons as member for Whitby, retaining the seat till the end of his life. In 1855 he was elected president of the Institution of Civil Engineers, of which he became a member in 1830. He died in London on the 12th of October 1859, and was buried in Westminster Abbey.

See *The Story of the Life of George Stephenson, including a Memoir of his Son Robert Stephenson*, by Samuel Smiles (1857; new ed., 1873); Jeaffreson, *Life of Robert Stephenson* (2 vols., 1864); and Smiles's *Lives of British Engineers*, vol. iii.

STEPNEY, GEORGE (1663–1707), English poet and diplomatist, son of George Stepney, groom of the chamber to Charles II., was born at Westminster in 1663. He was admitted on the foundation of Westminster School in 1676, and in 1682 became a scholar of Trinity College, Cambridge, becoming a fellow of his college in 1687. Through his friend Charles Montagu, afterwards earl of Halifax, he entered the diplomatic service, and in 1692 was sent as envoy to Brandenburg. He represented William III. at various other German courts, and in 1702 was sent to Vienna, where he had already acted as envoy in 1693. In 1705 Prince Eugène desired his withdrawal on the ground of his alleged partiality to the Hungarian insurgents, but the demand was taken back at the request of Marlborough, who had great confidence in Stepney. He was, nevertheless, removed in 1706 to the Hague. In the next year he returned to England in the hope of recovering from a severe illness, but died in Chelsea, London, on the 15th of September 1707, and was buried in Westminster Abbey. Stepney had a very full and accurate knowledge of German affairs, and was an excellent letter-writer. Among his correspondents was Baron Leibnitz, with whom he was on the friendliest terms. Much of his official and other correspondence is preserved in the letters and papers of Sir John Ellis (Brit. Mus. Add. MSS. 28875–28947), purchased from the earl of Macclesfield in 1872, and others are available in the record office. He contributed a version of the eighth satire of Juvenal to the translation (1693) of the satires "by Mr Dryden and several other eminent hands." Dr Johnson, who included him in his *Lives of the Poets*, called him a "very licentious translator," and remarked that he did not "recompense his neglect of the author by beauties of his own."

His poems appear in Chalmers's *English Poets*, vol. viii., and other collections of the kind. Some of his correspondence is printed by J. M. Kemble in *State Papers and Correspondence . . from the Revolution to the Accession of the House of Hanover* (1857). A list of the Macclesfield letters is to be found in the Report of the Hist. MSS. Commission, No. i., app. pp. 34–40. For an account of Stepney's family and circumstances, see R. Harrison, *Some Notices of the Stepney Family* (1870), pp. 22–28.

STEPNEY, an eastern metropolitan borough of London, England, bounded N. by Bethnal Green, E. by Poplar, S. by the river Thames, and W. by the City of London and Shoreditch. Pop. (1901), 298,600. It forms part of the "East End" of London; the parish, indeed, formerly covered practically the whole area so termed. Here are squalid streets and mean houses typical of the poorest class of inhabitants. The thoroughfares of Mile End Road and Whitechapel Road and that of Commercial Road East traverse the borough from the east and converge near the City boundary, where stood the ancient Aldgate. In the north Stepney includes the districts of Spitalfields, Whitechapel and Mile End; and in the south Wapping, Shadwell, Ratcliff and Limehouse. The southern districts are occupied by sailors and labourers in the St Katherine and London Docks and the wharves and factories lining the river-bank. The parish church of St Dunstan, Stepney, is a perpendicular building, much restored, containing many monuments and curious inscriptions. The church of St Anne, Limehouse (1730) is by Nicholas Hawksmoor. The district of Spitalfields has an old association with the silk-weaving industry; a trade in singing birds is also characteristic of this district; and in Ratcliff the well-known naturalist's firm of Jamrach is situated. In the extreme west the borough includes within its bounds the historic Tower of London, the Royal Mint and the fine Tower Bridge over the Thames. There is no bridge below this, but the construction of the Rotherhithe Tunnel was authorized in 1900. The Thames Tunnel is used by the East London railway. Among institutions the principal is the People's Palace, Mile End Road, opened by Queen Victoria in 1887 as a place of intellectual and physical recreation and education. The Drapers' Company contributed largely to the cost of erection. Toynbee Hall, Commercial Street, was founded in 1884 under the trusteeship of the Universities Settlements Association and named after Arnold Toynbee (d. 1883), a philanthropist who devoted himself to work in this part of London. Other institutions are the London Hospital, Whitechapel, the East London children's hospital, the headquarters of Dr Barnardo's Homes, Stepney Causeway, and Her Majesty's Hospital for waifs connected therewith; the Stepney training college of the Society for Promoting Christian Knowledge, and the Spitalfields trade and technical school. There is a fish market in Shadwell, and a vegetable market in Spitalfields. Stepney is a suffragan bishopric in the diocese of London. The municipal borough comprises the Stepney, Whitechapel, Mile End, Limehouse and St George divisions of the Tower Hamlets parliamentary borough, each division returning one member. The borough council consists of a mayor, 10 aldermen, and 60 councillors. Area, 1765·6 acres.

The name appears in Domesday and later as *Stevenhethe*. The suffix is thus the common form *hythe*, a haven; but for the prefix no certain derivation is offered. At Mile End, so called from its distance from the City (Aldgate), the rebels from Essex under the leadership of Wat Tyler assembled (1381), and here Richard II. first met them in parley. Pepys records the village as a favourite place of resort.

STEPNIAK, SERGIUS (1852–1895), Russian revolutionist, whose real name was Sergius Michaelovitch Kravchinski, was born in South Russia, of parents who belonged to a noble family. He received a liberal education, and, when he left school, became an officer in the artillery; but his sympathy with the peasants, among whom he had lived during his boyhood in the country, developed in him at first democratic and, later, revolutionary opinions. Together with a few other men of birth and education, he began secretly to sow the sentiments of democracy among the peasants. His teaching did not long remain a secret, and in 1874 he was arrested. He succeeded in making his escape—possibly he was permitted to escape on account of his youth—and immediately began a more vigorous campaign against autocracy. His sympathetic nature was influenced by indignation against the brutal methods adopted towards prisoners, especially political prisoners, and by the stern measures which the government of the tsar felt compelled to adopt in order to repress the revolutionary movement. His indignation carried him into accord for a time with those who advocated the terrorist policy. In consequence he exposed himself to danger by remaining in Russia, and in 1880 he was obliged to leave the country. He settled for a short time in Switzerland, then a favourite resort of revolutionary leaders, and after a few years came to London. He was already known in England by his book, *Underground Russia*, which had been published in London in 1882. He followed it up with a number of other works on the condition of the Russian peasantry, on Nihilism, and on the conditions of life in Russia. His mind gradually turned from belief in the efficacy of violent measures to the acceptance of constitutional methods; and in his last book, *King Stork and King Log*, he spoke with approval of the efforts of politicians on the Liberal side to effect, by argument and peaceful agitation, a change in the attitude of the Russian government towards various reforms. Stepniak constantly wrote and lectured, both in Great Britain and the United States, in support of his views, and his energy, added to the interest of his personality, won him many friends. He was chiefly identified with the Socialists in England and the Social Democratic parties on the Continent; but he was regarded by men of all opinions as an agitator whose motives had always been pure and disinterested. Stepniak was killed by a railway engine at a level crossing at Bedford Park, Chiswick, where he resided, on the 23rd of December 1895. He was cremated at Woking on the 28th of December. (H. H. F.)

STEPPE (from the Russ. *stepi*, a waste), the name given to the level treeless plains in certain parts of the Russian Empire, and thence sometimes, though not commonly, extended, in physical geography, to signify similar plains elsewhere. The name is most commonly applied specifically to the plains in the south and south-east of European Russia and in the south-west of Asiatic Russia, and in this connexion the term sometimes connotes semi-desert conditions. Otherwise the Russian steppes may be considered as kindred to and connected with the *Heiden* (heaths) of northern Germany.

STEPPES, GENERAL-GOVERNORSHIP OF, a portion of Russian Central Asia which includes both what was formerly known as the Kirghiz Steppe, and the region around Omsk, which was formerly part of Western Siberia. It consists of four provinces: Akmolinsk, Semipalatinsk, Turgai and Uralsk, having a total area of 711,000 sq. m. and a total population of 2,472,931 in 1897. Details are given under the names of the provinces respectively. Omsk is the capital.

STEREOBATE (Gr. στερεός, solid, and βάσις, a base), the term in architecture given to the substructure of rough masonry of a Greek temple.

STEREOCHEMISTRY (Gr. στερεός, solid, and chemistry), a branch of chemistry which considers the spatial arrangement of the atoms composing a molecule (see STEREO-ISOMERISM).

STEREO-ISOMERISM, or STEREOMERISM, a term introduced by Victor Meyer (by way of his denomination stereo-chemistry for "chemistry in space") to denote those cases of isomerism, *i.e.* the difference of properties accompanying identity of molecular formulae, where we are forced to admit the same atomic linking and can only ascribe the existing difference to the different relative position of atoms in the molecule.

Historical.—Considerations concerning the relative position of atoms have been traced back as far as Swedenborg (1721); in more recent times the first proposal in this direction seems due to E. Paternò (1869), followed by Auguste Rosenstiehl and by Alexis Gaudin (1873). The step made by J. A. Le Bel and J. H. van't Hoff (1874) brought considerations of this kind in the reach of experimental test, and so led to "stereo-chemistry." The work of Louis Pasteur on molecular asymmetry in tartaric acid (1860) touched stereo-chemistry so nearly that, had structural chemistry been sufficiently developed then, stereo-chemistry might have originated fourteen years earlier; it happened, however, that Wislicenus's investigation of lactic acids (1869) immediately stimulated Van't Hoff's views. The fundamental conceptions of Le Bel and Van't Hoff differ in that the former are based on Pasteur's notions of molecular asymmetry, the latter on structural chemistry, especially as developed by August Kekulé for quadrivalent carbon. Both seem to lead to the same conclusions as to stereo-isomerism, but the latter has the advantage of allowing a more detailed insight, whereas the former, which is free from hypothetical conceptions, is of absolute reliability.

As our knowledge of stereo-isomerism originated in the chemistry of carbon compounds and found the largest development there, this part will be treated first.

Stereo-isomerism in Carbon Compounds.

1. *The Asymmetric Carbon Atom.*—Though stereo-chemistry is based on the notion of atoms, there is not the least danger that it may break down when newer notions about those atoms are introduced. Even admitting that they are of a compound nature, *i.e.* built up from smaller electrical particles or anything else and able to split up under given conditions, their average lapse of existence is long enough to consider them as reliable building-stones of the molecule, though these building-stones may give way now and then, as our best ordinary ones by the action of an earthquake. Another thing which stereo-chemistry abstracts beforehand is the movement of atoms, which is generally accepted to exist, but becoming less as the temperature sinks and disappearing at absolute zero. And so the following symbols, representing atoms in a fixed position, may correspond to these last circumstances, whereas at ordinary temperatures atoms may vibrate, for instance, with these fixed positions as centres.

The first development from structural to stereo-chemistry was to consider the relative position of atoms in methane, CH_4. Structural chemistry had proved that the four atoms of hydrogen were linked to carbon and not to each other, thus $C{<}\begin{smallmatrix}H\\H\\H\\H\end{smallmatrix}$ and not, for example $H{-}H{\cdot}C{<}\begin{smallmatrix}H\\H\end{smallmatrix}$, but how the four were grouped remained to decide. The decision is derived as follows:—

If the four hydrogen atoms are supposed to be in a plane on one side of the carbon atom as above, two methylchlorides CH_3Cl should be possible, viz.:—

$$C{<}\begin{smallmatrix}Cl\\H\\H\\H\end{smallmatrix} \quad \text{and} \quad C{<}\begin{smallmatrix}H\\Cl\\H\\H\end{smallmatrix}.$$

Such isomeric compounds have never been found, but they appear as soon as the four atoms (or groups of atoms) to which carbon is combined are different, for example in CHFClBr, fluorchlorbrom-methane. Then and only then two isomeric compounds have been regularly observed, and the sole notion about relative position of atoms in methane which explains this fact is that the four groups combined with carbon are placed at the summits of a tetrahedron whose centre is formed by carbon. The two possibilities are then represented by:—

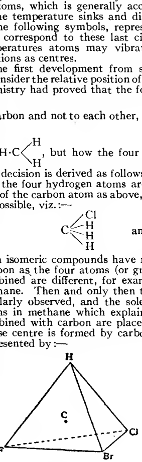

FIG. 1.

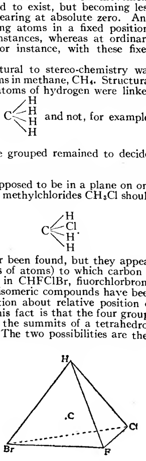

FIG. 2.

These groupings have the character of enantiomorphism, *i.e.* they are non-identical mirror images. If any of the two differences in the summits is given up, for example, F substituted by Cl with the formation of $CHCl_2Br$, the enantiomorphism disappears.

The isomerism corresponding to this difference in relative position is the simplest case of stereo-isomerism. The carbon atom in the special condition described, linked to four different atoms or groups, is denominated "asymmetric carbon," and will be denoted in the following formulae as **C**. Stereo-isomerism exists in tartaric acid, $HO_2C{\cdot}\mathbf{C}H(OH){\cdot}CH(OH){\cdot}CO_2H$ (studied by Pasteur), in the lactic acid, $CH_3{\cdot}\mathbf{C}H{\cdot}OH{\cdot}CO_2H$ (studied by Wislicenus), while the simplest case at present known is the chlorobromofluoracetic acid, $\mathbf{C}{\cdot}Cl{\cdot}Br{\cdot}F{\cdot}CO_2H$, obtained by Schwartz. This stereo-isomerism, due to the presence of asymmetric carbon, is of a characteristic kind, which is in perfect accordance with the theory of its origin, being the most complete identity combined with the difference that exists between the left and right hand. All the properties which cannot differ in this last sense are identical, viz.: melting and boiling point, specific gravity, &c. But the crystalline form, which may show enantiomorphism, indeed shows this difference in the isomers in question; and especially the behaviour (in the amorphous state) towards polarized light differs in the sense that the plane of polarization is turned to the left by the one isomer, and exactly as much to the right by the other, so that they may be termed "optical antipodes." All these differences disappear with the asymmetric carbon, and the succinic acid, $HO_2C{\cdot}CH_2{\cdot}CH_2{\cdot}CO_2H$, from tartaric acid is optically inactive and shows no stereo-isomerism.

2. *Compounds with more than one Asymmetric Carbon Atom.*—Stereo-isomerism and the space relation of atoms in compounds with higher asymmetry can best be developed by aid of graphic representations, founded on the notion of space relations in ethane, $H_3C{\cdot}CH_3$. A consequence of the tetrahedral grouping in methane is the configuration given in fig. 3, where the six hydrogen atoms are substituted by six atoms or groups $R_1, \ldots R_6$. The second (above) carbon atom is supposed to be at the top of the lower tetrahedron, and vice versa. Each other position, obtained by turning $R_1R_2R_3$ around the ·C—C· axis, is also possible, but since no isomerism due to this difference of relative position, which might already show itself in ethane, has been observed, we may admit that one of the positions obtained by the above rotation is the stable one, and fig. 3 may represent it. For simplicity's sake this figure may be projected on a plane by moving R_3 and R_6 respectively upward and downward, with R_1R_2 and R_4R_5 as axes, which leads to the first of the four configurations representing the stereo-isomers possible in the above case. They differ in the two possible spatial arrangements of $R_1R_2R_3$ and $R_4R_5R_6$:—

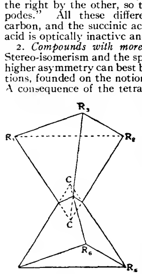

FIG. 3.

$$\begin{array}{c} R_3 \\ | \\ R_1\text{—}C\text{—}R_2 \\ | \\ R_4\text{—}C\text{—}R_5 \\ | \\ R_6 \end{array} \qquad \begin{array}{c} R_3 \\ | \\ R_2\text{—}C\text{—}R_1 \\ | \\ R_4\text{—}C\text{—}R_5 \\ | \\ R_6 \end{array} \qquad \begin{array}{c} R_3 \\ | \\ R_1\text{—}C\text{—}R_2 \\ | \\ R_5\text{—}C\text{—}R_4 \\ | \\ R_6 \end{array} \qquad \begin{array}{c} R_3 \\ | \\ R_2\text{—}C\text{—}R_1 \\ | \\ R_5\text{—}C\text{—}R_4 \\ | \\ R_6 \end{array}$$

As one asymmetric carbon introduces two stereo-isomers and two introduce four, n asymmetric carbon atoms will lead to 2^n isomers. They are grouped in pairs presenting enantiomorphic figures in space, as do the first and the last of the above symbols, which correspond to the character of optical antipodes, whereas the first and second correspond to greater differences in melting points, &c. A well-studied example is offered by the dibromides of cinnamic acid, $C_6H_5{\cdot}CHBr{\cdot}CHBr{\cdot}CO_2H$. They have been obtained by Liebermann in two antipodes melting at 92°, and two other antipodes, differing in optical rotation from the first, and melting at 195°.

A simplification is introduced when the structural formula shows symmetry, as is the case in $R_1R_2R_3C{\cdot}CR_3R_2R_1$. The four above-mentioned symbols then are reduced to three:—

$$\begin{array}{c} R_3 \\ | \\ R_1\text{—}C\text{—}R_2 \\ | \\ R_2\text{—}C\text{—}R_1 \\ | \\ R_3 \end{array} \qquad \begin{array}{c} R_3 \\ | \\ R_1\text{—}C\text{—}R_2 \\ | \\ R_1\text{—}C\text{—}R_2 \\ | \\ R_3 \end{array} \qquad \begin{array}{c} R_3 \\ | \\ R_2\text{—}C\text{—}R_1 \\ | \\ R_1\text{—}C\text{—}R_2 \\ | \\ R_3 \end{array}$$

of which the first and last show the enantiomorphism corresponding to the character of optical antipodes, while the second shows symmetry and corresponds to an inactive type. A well-studied example is offered here by tartaric acid: the two antipodes, often denoted as *d* and *l*, have been found, viz. in the ordinary dextrogyre form and the laevogyre form, prepared by Pasteur from racemic acid, while the third corresponds to mesotartaric acid; such internally compensated compounds are generally termed "meso."

3. *Cyclic Compounds.*—Three or more carbon atoms may link together so as to produce ring systems such as

$$\begin{array}{c} R_1CR_2 \\ \diagup\ \diagdown \\ R_3R_4C\text{——}CR_5R_6. \end{array}$$

It is in these cases that the principle of the asymmetric carbon, which in the above case leads to $2^3=8$ stereo-isomers, is easily applied by means of graphical representations in a plane, derived from the space relation shown in fig. 4. The six groups, $R_1 \ldots R_6$, are either under or above the plane in which the carbon ring is supposed to be situated, and this may be indicated by the following symbol:—

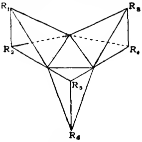

FIG. 4.

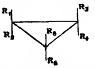
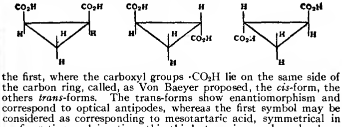


where the carbon atoms are supposed half-way between R_1 and R_2, R_3 and R_4, R_5 and R_6.

One of the most simple examples is offered by the trimethylene-dicarboxylic acids

$$\begin{array}{c} CH_2 \\ \diagup\ \diagdown \\ HO_2C{\cdot}HC\text{——}CH{\cdot}CO_2H \end{array}$$

for which three formulae can be deduced:—



the first, where the carboxyl groups $\cdot CO_2H$ lie on the same side of the carbon ring, called, as Von Baeyer proposed, the *cis*-form, the others *trans*-forms. The trans-forms show enantiomorphism and correspond to optical antipodes, whereas the first symbol may be considered as corresponding to mesotartaric acid, symmetrical in configuration and inactive; this third stereo-isomer has also been met with.

Special attention has been given to those ring systems of the general form:—

$$\begin{array}{c} R_1 \diagdown \qquad \diagup R_3\text{—}R_4 \diagdown \qquad \diagup R_2 \\ C \qquad\qquad\qquad C \\ R_2 \diagup \qquad \diagdown R_4\text{—}R_3 \diagup \qquad \diagdown R_1 \end{array}.$$

This trans-form corresponds to a cis-form, where both R_2 and R_1 are on the same side of the plane containing the ring. These latter are enantiomorphic in the ordinary sense of the word, but the particular feature is that the trans-form, though offering nc plane of symmetry, is yet identical with its mirror image, and thus not enantiomorphic and not corresponding to optical antipodes but to the meso-form.

There correspondences have been realized by Emil Fischer in derivatives of alanine, $H_3C{\cdot}CH(NH_2){\cdot}CO_2H$, which exists in two antipodes *d* and *l*. Two of these molecules can be combined to alanyl-alanine: $H_3C{\cdot}CH{\cdot}NH(COC{\cdot}H{\cdot}NH_2{\cdot}CH_3){\cdot}CO_2H$, which, as containing two asymmetric carbons, may be had in four stereo-isomers *dd*, *ll*, *dl* and *ld*. In their anhydrides

$$\begin{array}{c} H \diagdown \qquad \diagup CO\text{—}NH \diagdown \qquad \diagup CH_3 \\ C \qquad\qquad\qquad C \\ H_3C \diagup \qquad \diagdown NH\text{—}CO \diagup \qquad \diagdown H \end{array}$$

we meet the above type, and find that *dd* and *ll* formed the predicted antipodes, while the anhydride of *dl* and *ld* is one and the same substance, without any optical activity. Such cases are often termed "pseudo-asymmetric."

4. *Isolation of Optical Antipodes.*—The optical antipodes are often found as natural products, as is the case with the ordinary or *d*-tartaric acid; generally only one of the two forms appears, the second form (and, more generally both forms) being obtained synthetically. This is a problem of particular difficulty, since the artificial production of a compound with asymmetric carbon, from another which has no asymmetric carbon, always produces the two antipodes in equal quantity, and these antipodes, by their identity in most properties, *e.g.* melting and boiling point, solubility, and also on account of their analogous chemical behaviour, cannot be separated by customary methods, the application of which is rendered still more difficult by the formation of a so-called racemic compound.

The method called "spontaneous separation" was first observed by Pasteur with racemic acid, which in its double sodium and ammonium salt crystallized from its aqueous solution in two enantiomorphic forms, which could be separated on examination. One of the two proved to be the ordinary sodium-ammonium-tartrate, the other its laevogyre antipode; thus *l*-tartaric acid was discovered, and racemic acid proved to be a combination of *d*- and *l*-tartaric acid. The further examination of this particular transformation showed that it had a definite temperature limit. Only below 27° is Pasteur's observation corroborated, while above 27° a racemate appears; these changes are due to a chemical action taking place at the given temperature between the solid salts:—

$$2C_4O_6H_4NaNH_4{\cdot}4H_2O \rightleftarrows (C_4O_6H_4NaNH_4)_2{\cdot}2H_2O+6H_2O,$$

one molecule of the *d*- and one of the *l*-tartrate forming above 27°, the racemate with loss of water, while under 27° the opposite change occurs. This temperature limit, generally called transition-point, was discovered by Van't Hoff and Van Deventer. It is the limit where the possibility of spontaneous separation begins, and is relatively rare, so that this way of separation is an exceptional one, most antipodes forming a racemic compound stable at all temperatures that come into question.

The use of optically active compounds in separating antipodes is of the greatest value. The general principle is that the compounds which the *d*- and *l*-form give with a different active compound, for instance *d* producing *dd* and *ld*, are by no means antipodes and so exhibit the ordinary differences, *e.g.* in solubility, which allow separation. It was in this way that Pasteur split up racemic acid by cinchonine. This method has since been applied to the most various acids; bases may be split in an analogous way; artificial conine was separated by Ladenburg by means of *d*-tartaric acid, and one of these antipodes proved to be identical with natural conine. Aldehydes and ketones on the other hand may be split up by their combinations with an active hydrazine, &c., and so this method is by far the most fruitful.

The formation of a racemic compound built up from *dd* and *ld* has also been observed in the so-called partial racemate. An example is the racemate of strychnine. It is in this case also that the transition-point forms the limit of possible separation, determined by Ladenburg and G. Doctor to be 30°. Such partial racemic combination however occurs only in exceptional cases, else it would have invalidated this method, as it did spontaneous separation.

A different way of using active compounds in producing antipodes consists in the so-called asymmetric synthesis. The method consists in the introduction of an active complex before that of the asymmetric carbon; both stereo-isomers need not then form in the same quantity. W. Marckwald and A. McKenzie, who chiefly worked out this method, found, for example, that the salt of methylethylmalonic acid, $C(CH_3)(C_2H_5)(CO_2H)_2$, with the active brucine forms on heating the corresponding salt of *d*- and *l*-methylethylacetic acid $C(CH_3)(C_2H_5)H(CO_2H)$, with the *l*-antipode in slight excess.

5. *Configuration of Stereo-isomers.*—The conception of asymmetric carbon not only opens the possibility of determining when and how many stereo-isomers are to be expected, but also allows a deeper insight into the relative position of atoms in each of them. The chief indication here lies in the configuration of the meso-type, already given for mesotartaric acid; the corresponding alcohol, the natural sugar erythrite, which produces this acid by oxidation, consequently corresponds to

$$\begin{array}{c} CH_2OH \\ | \\ H-C-OH \\ | \\ H-C-OH \\ | \\ CH_2OH. \end{array}$$

In the glutaric acids, $HO_2C\cdot(CH\cdot OH)_3\cdot CO_2H$, the structural symmetry again leads to meso-forms

$$\begin{array}{ccccccccc} & OH & & OH & & OH & \\ & | & & | & & | & \\ HO_2C- & C & - & C & - & C & -CO_2H \\ & | & & | & & | & \\ & H & & H & & H & \end{array} \quad \text{and} \quad \begin{array}{ccccccccc} & OH & & H & & OH & \\ & | & & | & & | & \\ HO_2C- & C & - & C & - & C & -CO_2H. \\ & | & & | & & | & \\ & H & & OH & & H & \end{array}$$

They are respectively obtained by the oxidation of ribose and natural xylose, stereo-isomers of the formula $COH(CHOH)_3CH_2OH$; the latter produces active tartaric acid and so decides that the second formula is that of the corresponding trioxyglutaric acid, the first remaining for that obtained from ribose.

In such and analogous ways the configuration of meso-types may be fixed with absolute certainty. The decision is more difficult in the case of antipodes. For tartaric acid it is certain that the *d*- and *l*-forms correspond to

$$\begin{array}{c} CO_2H \\ | \\ HCOH \\ | \\ HOCH \\ | \\ CO_2H \end{array} \quad \text{and} \quad \begin{array}{c} CO_2H \\ | \\ HOCH \\ | \\ HCOH \\ | \\ CO_2H, \end{array}$$

but which of the two represents the ordinary *d*-acid is unknown. Emil Fischer proposed to decide provisionally in an arbitrary way and admit for the *d*- the first formula. Then we may conclude that the natural malic acid, which may be obtained by the reduction of *l*-tartaric acid, is

$$\begin{array}{c} CO_2H \\ | \\ CH_2 \\ | \\ HCOH \\ | \\ CO_2H, \end{array}$$

while the natural xylose, which produces *l*-tartaric acid by the substitution of CO_2H for $CHO\cdot CHOH$, corresponds to

$$\begin{array}{c} CHO \\ | \\ HCOH \\ | \\ HOCH \\ | \\ HCOH \\ | \\ CH_2OH. \end{array}$$

The results obtained in these and analogous ways have proved to be of value in the study of enzymes, *e.g.* such complex organic substances as zymase in yeast, which is able to produce in small quantity an unproportioned large amount of chemical change, in this case the transformation of the sugar glucose, $C_6H_{12}O_6$, into alcohol and carbonic acid

$$C_6H_{12}O_6 = 2C_2H_6O + 2CO_2.$$

These enzymes have an extremely specific action, producing, for instance, the change in ordinary natural glucose, but not at all in its artificial antipode, and so they are often valuable means of isolating an antipode from the inactive mixtures or racemic compounds; this method has indeed been used for the isolation of the glucose-antipode from the artificial racemic form. The fundamental fact here is due once more to Pasteur, but Emil Fischer added that sugars are acted upon by zymase in an analogous way if their configuration shows a certain amount of identity. For example yeast acts on

$$\begin{array}{ccc} d\text{-Glucose} & d\text{-Mannose} & d\text{-Fructose} \\ HCO & HCO & H_2COH \\ | & | & | \\ HCOH & HOCH & CO \\ | & | & | \\ HOCH & HOCH & HOCH \\ | & | & | \\ HCOH & HCOH & HCOH \\ | & | & | \\ HCOH & HCOH & HCOH \\ | & | & | \\ H_2COH & H_2COH & H_2COH, \end{array}$$

and we observe that the three formulae agree indeed in the lower four-carbon chain. This particular behaviour led Fischer to the expression that the enzyme-action on given substances needs a corresponding feature as "lock and key." There are indications that in the synthesis by enzymes, of which examples have been realized in fats, sugars, glucosides and albuminoids, an analogous behaviour prevails.

6. *Mutual Transformation of Antipodes.*—Thus far we have supposed the molecule to be stable with atoms in fixed places, as may be the case at absolute zero; in reality, at ordinary temperatures, atoms probably are endowed with movement, and this may be supposed to take place along the fixed places just mentioned as centres, which movement can go so far as to lead to total transformation, the one stereo-isomer changing over into the other. These cases may be considered now.

As a general rule the liquid, gaseous or dissolved antipode is in itself unstable, tending to be transformed into inactive complexes. Temperature may accelerate this, and, as a rule, sufficient heat will produce the loss of optical activity, half of the original compound having changed over into its optical antipode. This transformation has been often used for preparing the latter, as was first done by Le Bel with the optically active amyl alcohol, $HC(CH_3)(C_2H_5)(CH_2OH)$, rendering it inactive by sufficient heating, and separating from the obtained complex the stereo-isomer. Walden found that in some cases analogous transformations take place at ordinary temperature, as for instance with *d*-phenylbromacetic acid, which within three years totally lost its considerable rotative power; this transformation has been termed "autoracemization." It explains that till now the most simple compounds with asymmetric carbon have not yet been obtained in antipodes; active CHClBrF might be obtained by treating chlorobromofluoracetic acid with potash, but autoracemization, which especially shows itself when halogens are linked to the asymmetric carbon, might, without special precautions, lead to an inactive mixture of antipodes.

When two asymmetric carbons are present, four stereo-isomers are possible, which may be represented by:—

$$(1)\ A+B,\ (2)\ -(A+B),\ (3)\ A-B,\ (4)\ -(A-B),$$

(1) and (2), as well as (3) and (4), being antipodes. The stable form will be in this case also the inactive mixture, corresponding in the solid state either to (1), (2) or (3), (4). In the last case, suppose the primitive compound is (1), the first step towards stability may be the production of (3), so that practically one stereo-isomer changes over into another of a different type. Such has, for instance, been proved by Bechmann for *l*-menthol,

$$\begin{array}{ccc} & H-C-C_3H_7 & \\ & / \quad \backslash & \\ H_2C & & CH_2 \\ | & & | \\ H_2C & & CO \\ & \backslash \quad / & \\ & H-C-CH_3, & \end{array}$$

which on heating produces a form rotating in opposite sense, though not the antipode. Probably H and CH_3 in the lower asymmetric carbon have changed places. A further treatment at high temperature might probably produce the inactive mixture of this menthol and its antipode.

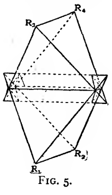


Fig. 5.

7. *Doubly-Linked Carbon Atoms.*—When carbon atoms are doubly linked, as in derivatives of ethylene, $H_2C:CH_2$, the two tetrahedra representing the four groups around each carbon may be supposed to have two summits combined, as was supposed with one in simple linking. Fig. 5 represents this supposition, from which follows that the six atoms in question are situated in a plane and may be represented by a plane figure:—

$$\begin{array}{c} R_1{\cdot}C{\cdot}R_2 \\ \| \\ R_3{\cdot}C{\cdot}R_4. \end{array}$$

The chief consequence is that as soon as the two atoms or groups attached to each carbon are different, two stereo-isomers may be looked for:—

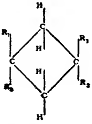
$$\begin{array}{c} R_1{\cdot}C{\cdot}R_2 \\ \| \\ R_1{\cdot}C{\cdot}R_2 \end{array} \qquad \begin{array}{c} R_1{\cdot}C{\cdot}R_2 \\ \| \\ R_2{\cdot}C{\cdot}R_1. \end{array}$$

Such has been found to be the case, fumaric and maleic acids,

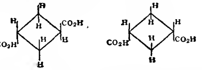
$$\begin{array}{c} H{\cdot}C{\cdot}CO_2H \\ \| \\ HO_2C{\cdot}C{\cdot}H \end{array} \qquad \begin{array}{c} H{\cdot}C{\cdot}CO_2H \\ \| \\ H{\cdot}C{\cdot}CO_2H, \end{array}$$

forming the oldest and one of the most simple examples; the simplest is α-chlorpropylene $(H_3C)HC:CClH$.

The nature of this stereo-isomerism is quite different from that in antipodes. There is no enantiomorphism in the supposed configurations, and so no rotatory power, &c., in the corresponding compounds, which, on the other hand, show differences far deeper than antipodes do, having different melting points, solubility, heat of formation, chemical properties, &c., behaving in these as ordinary isomers. These isomers, having some relation to those in cyclic compounds, may be also denoted as *cis*-(maleic) and *trans*-(fumaric) forms, a close analogy existing indeed in those ring systems of which the simplest type is:—



this has been realized in the 1, 3-tetramethylene dicarboxylic acids, which exist in a trans- and cis-form:—



When two double carbon linkings are present, as in $H_2C:C:CH_2$, the four hydrogen atoms form the summits of a tetrahedron according to the development in fig. 4; and consequently the introduction of different groups may bring enantiomorphism and optical antipodes. This has been realized in the compound 1-methyl-*cyclo*-hexylidene-4-acetic acid (formula I.), first prepared by W. H. Perkin and W. J. Pope in 1908, and resolved into its components by fractional crystallization of its brucine salt by Perkin, Pope and Wallach. The substance resolved by W. Marckwald and R. Meth in 1906, which was regarded as this acid, was really the isomeric 1-methyl-$\Delta3$-*cyclo*-hexene-4-acetic acid (formula II.), which contains asymmetric carbon atoms (see *Journ. Chem. Soc.*, 1909, 95, p. 1791; cf. ibid., 1910, 97, p. 486).

$$\underset{\text{I.}}{\begin{array}{c} H_3C \\ H \end{array}\!\!>C<\!\!\begin{array}{c} CH_2{\cdot}CH_2 \\ CH_2{\cdot}CH_2 \end{array}\!\!>C:C<\!\!\begin{array}{c} H \\ CO_2H, \end{array}} \quad \underset{\text{II.}}{\begin{array}{c} H_3C \\ H \end{array}\!\!>C<\!\!\begin{array}{c} CH_2{\cdot}CH \\ CH_2{\cdot}CH_2 \end{array}\!\!\gg C{\cdot}CH_2{\cdot}CO_2H}$$

8. *Numerical Value of Optical Rotation.*—To express the value of optical rotation either specific or molecular rotation may be chosen, the first being the deviation caused by a layer of 1 decimetre in length when the substance in question is supposed to be present with specific gravity 1, the latter is this value multiplied by one-hundredth of the molecular weight. Specific rotation is indicated by $[\alpha]^t_D$, where the suffix indicates the wave-length of the light in question, D being that of the sodium line, and t the temperature; $[M]^t_D$ is the corresponding value of molecular rotation. Both values vary with the solvent used, and probably are most adapted to solve problems touching relations of rotatory power and configuration, when they apply to extreme dilution in the same liquid.

One of the most general rules, relating to rotatory power, is that for electrolytes, *i.e.* salts in aqueous solution, viz. the limiting rotation in dilute solution only depends on the active radicle. Oudemans found that for such active bases as quinine in its salts with hydrochloric, nitric, chloric, acetic, formic, sulphuric, oxalic, phosphoric, perchloric acids the specific rotation (calculated for the base) only varies from $-272°$ to $-288°$; H. H. Landolt found the same thing for active acids, the mono lithium, sodium, potassium and ammonium tartrates varying only between 27·5° and 28·5° (calculated for the acid). A corresponding rule may be expected where both base and acid have rotatory power; the molecular rotation will be the sum of those for base and acid in salts with inactive radicles. Each of these rules finds sufficient explanation in Arrhenius's view of electrolytic dissociation, which admits that diluted electrolytes are split up in their ions, and so the salts of quinine (Q) owe their rotatory power to the ion $\overset{+}{QH}$, those of acid tartrates to the ion $\overset{-}{C_4H_5O_6}$, and quinine-tartrate to both.

With non-electrolytes relations are less evident. One general observation is that non-saturation, especially cyclic structure, augments rotatory power. The saturated compounds, hydrocarbons, alcohols, ethers, amines and acids rarely show specific rotations higher than 10°, and some of them, as mannite, $CH_2OH(\mathbf{C}HOH)_4CH_2OH$, for instance, show such small values that only a more thorough investigation, due to the theoretical probability of rotatory powers in asymmetric natural products, has detected the optical activity.

Unsaturated compounds generally show larger rotative powers; amyl alcohol with $-5°$ produces an aldehyde with 15°; succinic (diamyl) ether with 9° produces fumaric ether with 15°, &c. Cyclic configuration especially leads to the highest values known: the lactic acid with 3° leads to a lactone with $-86°$,

$$\begin{array}{c} H_3C{\cdot}CH{\cdot}COO \\ \quad\;\; | \qquad\; | \\ \quad OOC{\cdot}HC{\cdot}CH_3; \end{array}$$

mannosaccharic acid, $HO_2C(\mathbf{C}HOH)_4CO_2H$, to a dilactone (with two rings, formed by the loss of two molecules of water) with 202°, whereas the original acid only shows a small rotation.

A second conception, which connects rotation with configuration in non-electrolytes, is due to Alexander Crum Brown and P. A. Guye. It starts from the simple assumption that, as rotatory power is due to the difference of the four groups around the asymmetric carbon, so its amount may correspond to the amount in this. So, generally speaking, take some property, denoted by $K_1, \ldots K_4$ respectively, a function:—

$$(K_1-K_2)\,(K_1-K_3)\,(K_1-K_4)\,(K_2-K_3)\,(K_2-K_4)\,(K_3-K_4)$$

would express what is wanted. It becomes zero when two groups are equal; it changes its sign, retaining its value, when K_1 is interchanged with K_2, &c. The chief difficulty in application is to point out that property which is here dominating. It has been supposed to be weight, and then the above expression divided by $(K_1+K_2+K_3+K_4)^6$ might be proportional to specific rotation. This explains, for instance, that in the homologous series of glyceric ethers $\begin{array}{c} HO \\ H \end{array}\!\!>\mathbf{C}<\!\!\begin{array}{c} CH_2OH \\ CO_2R \end{array}$, augmenting the heaviest group, $\cdot CO_2R$, first augments the specific rotation, which then passes through a minimum (the theoretical limit being zero):—

Ether of methyl, ethyl, propyl, butyl, hexyl, octyl,

$[\alpha]_D = -4{\cdot}8°, \; -9{\cdot}2°, \; -12{\cdot}9°, \; -13{\cdot}2°, -11{\cdot}3°, -10{\cdot}2°.$

But the serious objection is met that groups of equal weight and different structure often allow considerable rotatory power as in methyl acetylamygdalate, with $-146°$, though in the formula $C_6H_5\mathbf{H}C(OC_2H_3O)\,(CO_2CH_3)$ the third and fourth groups are of equal weight. It is in this way especially that other properties might be tested, such as volume or density, and perhaps qualities related to light, such as refractive power and the dielectric constant. Attempts to connect the rotatory power of a compound with more asymmetric carbons to the action of each of these separately, *i.e.* by the so-called optical superposition have not been very successful. In the four stereo-isomeric acids $CO_2H(CHOH)_3CH_2OH$ of the following configurations

CO_2H	CO_2H	CO_2H	CO_2H
HCOH	HCOH	HOCH	HOCH
HOCH	HCOH	HCOH	HOCH
HOCH	HCOH	HCOH	HOCH
H_2COH	H_2COH	H_2COH	H_2COH
l-arabonic acid,	*d*-ribonic acid,	*d*-lyxonic acid,	*d*-xylonic acid.

We might suppose the upper asymmetric carbon to produce a rotation $+A$ or $-A$, the other $\pm B$ and $\pm C$. The rotations then were $A-B-C$, $A+B+C$, $-A-B+C$ and $-A+B-C$ or zero in total. This supposition is in so far related to that of Crum Brown and Guye that it admits that the smallest conceivable change, *i.e.* stereo-isomeric change, in one group does not influence the rotation caused by the asymmetric carbon attached to it. It has not been tested in this case, but substances as propyl- and isopropyl-glycerate only differ in specific rotation from $-12{\cdot}9°$ to

$-11{\cdot}8°$, and might prove identical in the same solvent; the sharpest test might be afforded by propylisopropylacetic acid.

9. *Steric Hindrance.*—The difference in the relative positions of atoms not only explains the different behaviour of optical antipodes, as has been indicated, but also gives some indication where no optical activity is concerned.

In the stereo-isomerism of ethylene compounds, taking maleic and fumaric acid as examples, space relations chiefly indicate that in one of the two the carboxyl groups CO_2H are nearer. Such seems indeed to characterize maleic acid. It easily gives an anhydride of the cyclic formula $\begin{array}{l} HC-CO \\ \| \qquad \rangle O \\ HC-CO \end{array}$ and, inversely, when cyclic compounds such as benzene are broken down by oxidizing agents, it is maleic and not fumaric acid that appears. On the other hand the presence of the two negative carboxyls makes maleic acid the stronger acid but less stable, with a pronounced tendency to change over into fumaric acid; this goes hand in hand, according to a general rule, with smaller heat of formation, lower melting point and increased solubility.

In the cyclic compounds analogous phenomena occur. The formation of lactones, *i.e.* cyclic anhydrides derived from oxy-acids by interaction of hydroxyl and carboxyl, presents one of them. In the oxy-acids of the fatty series a particular feature is that from the isomers, denoted as α, β and γ, &c. $HO_2C{\cdot}CHOH(CH_2)_nCH_3$, $HO_2C{\cdot}CH_2{\cdot}CHOH{\cdot}(CH_2)_{n-1}CH_3$, $HO_2C{\cdot}(CH_2)_2{\cdot}CHOH(CH_2)_{n-2}CH_3$, &c., the γ-compounds most easily form a lactone, though in the α-series carboxyl and hydroxyl run nearer. The tetrahedral arrangement, however, as shown in fig. 6, explains that A, one of the groups attached to the carbon atom C_1, is fairly near C_5, one of the groups attached to the carbon atom C_4 (the angle A being 35°); A would correspond to the hydroxyl forming part of carboxyl around C_1; C_5 to the hydroxyl linked with the carbon atom in the γ-position.

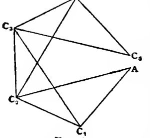


FIG. 6.

A third consideration on analogous ground is that of "steric hindrance." It was introduced by Victor Meyer's discovery that derivatives of benzoic acid, having two substituents (X and Y) in the immediate neighbourhood of carboxyl:—

are unable to form ethers in the ordinary way, by treating with methyl alcohol and hydrochloric acid, whereas the isomers having only one of the substituents Y in 4 (X in 6) readily do; it was suggested that the presence of X and Y near CO_2H prevented the access to the latter. This argument has not been completely established, but a large amount of quantitative corroboration has been brought together by N. A. Menschutkin, who has found that in alcohols the more the hydroxyl group is surrounded by substituents (for instance CH_3) the slower esterification (with acetic anhydride in acetone at 100°) takes place, the ratio of rates being

Methyl alcohol $H_3C{\cdot}OH$	100
Ethyl alcohol $H_3C{\cdot}CH_2{\cdot}OH$	48
Dimethyl carbinol $(H_3C)_2CH{\cdot}OH$	14
Trimethyl carbinol $(H_3C)_3C{\cdot}OH$	0·8

Stereo-isomerism in Other Elements.

Phenomena analogous to those observed in carbon compounds might also exist in derivatives of other quadrivalent elements; and only the relative stability of carbon-compounds makes every form of isomer, which often is unstable, more easily obtainable in organic chemistry. Nevertheless it has been possible to obtain stereo-isomers with different elements, but, as expected from the above, especially in derivatives containing carbon. Some of them have the character of optical antipodes and are more easily considered from a theoretical point of view; others have not.

1. *Optically Active Stereo-isomers.*—Most closely related to the phenomena with carbon are those with sulphur, selenium, tin and silicon, when these elements behave as quadrivalent. S. Smiles (*Journ. Chem. Soc.*, 1900, 77, pp. 1072, 1174; 1905, 87, p. 450) split up such derivatives of methylethyl-thetine as

$$\begin{array}{ccc} C_2H_5 & & CH_2{\cdot}CO{\cdot}C_6H_5 \\ & S & \\ CH_3 & & Br \end{array}$$

obtained by condensing methylethyl sulphide with ω-bromacetophenone, by means of the salt with *d*-bromocamphosulphonic acid, into optical antipodes.

W. J. Pope and A. Neville (*Journ. Chem. Soc.*, 1902, 18, p. 198) succeeded in the same way with a selenium compound

$$\begin{array}{ccc} C_6H_5 & & CH_2CO_2H \\ & Se & \\ H_3C & & Br \end{array} ;$$

W. J. Pope and S. J. Peachey (*Journ. Chem. Soc.*, 1900, 16, pp. 42, 116) with a compound of tin (tin methylethylpropyl iodide)

$$\begin{array}{ccc} C_2H_5 & & C_3H_7 \\ & Sn & \\ H_3C & & I \end{array} ;$$

Kipping (*Journ. Chem. Soc.*, 1904, 20, p. 15; 1907, 23, p. 9) with one of silicon (benzylethylpropyl silicol)

$$\begin{array}{ccc} C_2H_5 & & C_3H_7 \\ & Si & \\ C_6H_5{\cdot}CH_2 & & OH. \end{array}$$

These facts may be explained in the same way as with carbon, by admitting tetrahedral grouping. A special feature, however, wanting with carbon, is that compounds with one atom only of the element in question have been obtained as antipodes. A second observation of some interest is that the compounds in question are electrolytes and that, as in solutions, where they are split up into ions, activity must be due to the last, the ionic complex, for instance, $R_1R_2R_3S$, must cause optical rotation.

Optical antipodes have also been obtained with quinquevalent nitrogen in compounds of the type: $R_1R_2R_3R_4NR_5$. Le Bel observed these in methylethylpropyl-isobutylammonium chloride; since then Pope and Peachey and Wedekind studied the same question more thoroughly, and as a general result it is now stated that ammonium compounds with four different radicals behave as asymmetric carbon compounds. The explanation may be that the four radicals arrange themselves in the two possible tetrahedral configurations, and that the fifth element or group, *e.g.* chlorine or hydroxyl, more loosely linked, finds its fittest place, as shown in figs. 7 and 8.

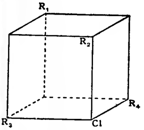

FIG. 7.

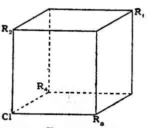

FIG. 8.

2. *Stereo-isomers Without Optical Activity.*—The chief cases here belong to the derivatives of nitrogen with double linking and the metallic compounds which have been chiefly studied by Werner.

The nitrogen compounds showing stereo-isomerism belong to two classes, according to the structural formulae, containing C:N or N:N; in their general behaviour they seem related to the ethylene derivatives.

The first group was detected by Victor Meyer and Goldschmidt in benzildioxime: $\begin{array}{l} C_6H_5{\cdot}C:NOH \\ \quad | \\ C_6H_5{\cdot}C:NOH. \end{array}$

Later investigations, especially by Hantzsch, showed that a grouping

$$\begin{array}{ccc} R_1{\cdot}C{\cdot}R_2 & \qquad & R_1{\cdot}C{\cdot}R_2 \\ \| & & \| \\ X{\cdot}N & & N{\cdot}X \end{array}$$

gives rise to stereo-isomerism, the supposed difference being that X is either more close to R_1 or to R_2. This peculiarity is observed in the aldoximes and ketoximes, derived from aldehydes and ketones on treatment with hydroxylamine, and the two simplest examples are ethyl-aldoxime $H_3C{\cdot}CH:NOH$, and phenyl-benzyl-ketoxime, $(C_6H_5)(C_6H_4CH_2)C:NOH$. As the behaviour of these stereo-isomers much resembles that of ethylene-compounds, they are often indicated as cis- and trans-forms.

The second stereo-isomerism in nitrogen-compounds was detected by Schraube in potassium benzenediazotate, and may perhaps be reproduced by the following symbols:—

$$\begin{array}{c} C_6H_5{\cdot}N \\ KON \end{array} \text{ and } \begin{array}{c} C_6H_5N \\ NOK. \end{array}$$

The last group of stereo-isomers, in which insight is most difficult yet, is that of Werner's complex metallic compounds, observed with cobalt, platinum and chromium. No enantiomorphous character throws light here, and there is no relation to ethylene derivatives.

With cobalt the fact is that in the hexammonic cobalt salts, *e.g.* $Co(NH_3)_6Cl_3$, when NH_3Cl is substituted by NO_2 isomerism appears as soon as the number of substituents is two; Jörgensen's flavo-salts $Co(NH_3)_4(NO_2)_2Cl$, and Gibbs's isomeric croceo-salts offer examples. Werner puts forward that a grouping of $(NH_3)_6$ at the summits of a regular octahedron around Co may explain this.

Platinum compounds such as $(H_3N)_2\,PtCl_2$ have been obtained in two forms, Werner admitting here the following plane configurations:—

Chromium shows a behaviour analogous to that of cobalt, and analogous space-formulae may be used here. But, in a general way, at present it is extremely difficult to decide upon their value.

BIBLIOGRAPHY.—The standard authority is C. A. Bischoff and P. Walden, *Handbuch der Stereochemie* (1894), with the two supplementary volumes (by Bischoff) entitled *Materialien der Stereochemie* (1904), containing abstracts of papers up to 1902. A. W. Stewart, *Stereochemistry* (1908), is a comprehensive survey. The views of A. Hantzsch and A. Werner are developed in Hantzsch, *Grundriss der Stereochemie* (1904), and Werner, *Lehrbuch der Stereochemie* (1904). Other works are: H. Landolt, *Optische Drehungsvermögen* (2nd ed., 1898); Eng. trans. *Optical Activity and Chemical Composition* (1900); J. H. van't Hoff, with a preface by J. Wislicenus, *Die Lagerung der Atome im Raume* (3rd ed., 1908), Eng. trans. (with an appendix by Werner dealing with stereo-isomerism among other elements) by A. Eiloart, entitled *The Arrangement of Atoms in Space* (1898); J. B. Cohen, *Organic Chemistry* (1907), pp. 56–171. Pamphlets, &c., dealing with special subjects, are W. van Ryn, *Die Stereochemie des Stickstoffs* (1897); E. For the stereo-isomerism exhibited by ammino compounds see COBALT and PLATINUM; also Werner, *Ann.*, 1910, 375, p. 1. Recent progress is reported in *The Annual Reports of the Chemical Society* (annual since 1904). (J. H. VAN'T H.)

STEREOSCOPE (Gr. στερεός, solid, σκοπεῖν, to see).[1] The fundamental property of stereoscopic vision, or simultaneous vision with both eyes, is the direct perception of the relative distances of near objects. Of course, ideas of the different distances of objects also occur in vision with a single eye, but these are the result of other experiences and considerations. These representations are also not always unequivocal (see fig. 1). For instance they may arise from the former knowledge of the shape and size of a distant object, from the partial covering of one object by another; and they very often occur where stereoscopic observation fails; this latter is involuntary, *i.e.* the observer is unconscious of it. We will now investigate the conditions necessary for the perception of depth.

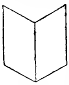

FIG. 1.

If the head is held still only one portion of space can be observed stereoscopically. The single eye, when moved, surveys, including indirect vision, a field which measures 180° in a horizontal direction, and 135° in a vertical direction. The two fields overlap and a smaller conical space is formed, with the nose as vertex (B V S in fig. 2), in which both eyes can see simultaneously; and outside this space stereoscopic vision is impossible. The shape and size of this space are very different in men and animals. According to Armin Tschermak the horizontal extent of the space surveyed with both eyes is only 34° in a rabbit as compared with 90° in man, 15° in a fowl and about 5° in a carp (measured in water). There is a further difference between the eyes of men and animals. The optic axis of the eye is the line joining the centres of the curves, but the direction in which the eye can see most clearly does not always coincide with this, being determined by the spot on the retina which is most susceptible to light, the so-called yellow spot (*Fovea*, F in fig. 2). In man this spot is still near the axis, although not always exactly on it. It is not perfectly known how it is situated in animals, but in many the axes of the eyes diverge (especially strongly in geese), and the portions of the retina utilized in stereoscopic vision lie far distant from the axis, as in many animals the eyes are only slightly movable.

Every time that the eyes are directed on one spot (P in fig. 2) this point is seen simply, together with a number of other points which together form the so-called "horopter." According to Joh. Müller, Helmholtz, Hering, Volkmann and others, these are those points of the object-space (*e.g.* Q and R in fig. 2), whose images fall on *identical* or corresponding spots on the retina, by which are meant those points on the retina whose *nerve filaments* are united and which are equidistant in the same direction from the centre of the yellow spot (see EYE; VISION). The horopter varies according to the position of the fixed spot in the object-space; for example, it is the ground

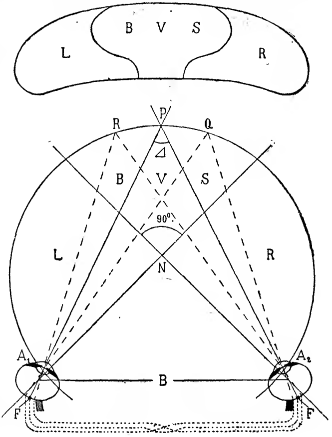

FIG. 2.

itself for a man standing erect and looking straight ahead. All object-points situated outside the horopter fall on points of the retina which are not identical, but the two images are only seen as real double images in exceptional cases. As a rule the effect is that these points are also seen simply, but at other distances than that of the fixed point P. The differences of the images arise in the moving of the image-points in the direction of the connecting line of the two eyes. For this reason the eyes cannot recognize the space between parallel shining telegraph wires if the connecting line of the two eyes be parallel to the wires, whilst the perception of the depth occurs involuntarily if the connecting line of the eyes is more or less perpendicular to the wires. These differences of images which have been mentioned are therefore necessary and are sufficient for the perception of depth. The explanation that the perception of depth was due to a difference between the two retinal images was first given by Ch. Wheatstone in 1833; but it was contradicted by E. Brücke (1841), Sir David Brewster (1843) and others, who stated that when observing an object the angle of convergence of the axes of the eyes continually changed, and through this and also by the exertion of the muscles and the accommodation of the eye there was a simultaneous touching of the object, which gave rise to the perception of its depth. This latter theory, however, was contradicted by H. W. Dove, who showed that a stereoscopic viewing was also possible with momentary illumination of the object; and still less does it agree with the

[1] The subject of stereoscopy has been extensively developed by the author of this article, who, curiously enough, having lost the sight of one eye through an accident, could no more enjoy the beauties of stereoscopic sight.—ED.

fact, to which Wheatstone first called attention, that facsimiles also have a stereoscopic influence, in spite of the fact that the images retain their position on the retina unchanged. Numerous experiments show the same result, and it follows that even a change of the angle of convergence is not always observed as a change of depth.

There are two kinds of stereoscopic vision, direct and indirect, according to whether the point seen indirectly, *e.g.* H in fig. 3, is compared with the fixed point P, or with another point seen indirectly, *e.g.* J in fig. 3. In both kinds of stereoscopic vision the exactness of the observation of the depth is greater as the point J approaches H, and the point H approaches P. As a matter of fact a man's eyes are naturally never perfectly still. They move in their sockets, and the point P, where the axes intersect, is continually changing. Direct stereoscopic vision arises from indirect stereoscopic vision and vice versa, and the accuracy of the discernment of the depth increases and decreases. As in this the eye does not revolve round its lens but round the centre of the sphere situated 10 mm.

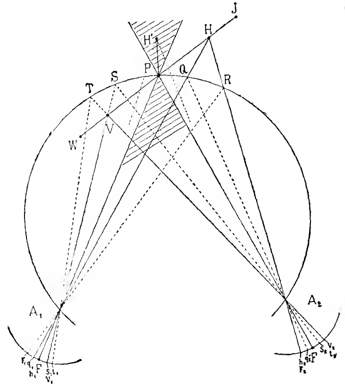

FIG. 3.

behind it, the entrance-pupil of the eye moves slightly to and fro and up and down, and many experiments have been made to produce a perception of depth for a single eye from the relative movements of the images consequent on this motion. As these movements of the images only occur in indirect vision, it can be understood they are not seen by most people. This, however, cannot be regarded as an actual perception of depth, because these viewings necessitate a consideration for each individual interpretation, which is quite foreign to stereoscopic vision.

Indirect stereoscopic vision is of great importance. It makes it possible to recognize any sudden danger or obstacle outside the direction in which one is looking. Even with the stereotelemeter (see below) the position of the range through which, for example, a bird flies, could not always be accurately given, if one were solely dependent upon direct stereoscopic vision. If the attention and eyes are directed upon a certain object, as for instance, in manual labour and in measuring the image-space with the so-called "travelling mark" on the stereocomparator, then direct stereoscopic vision only is concerned.

Stereoscopic vision is in many ways similar to the monocular observation of a preparation under the microscope, and yet there is a great difference. In an unchanged focused microscope it cannot be distinguished which of the indistinct objects are above and which are below the plane focused for. In stereoscopic vision, however, this can be seen directly. How does this happen? Why does the point H in fig. 3 appear behind and the point V in front of the point P when both eyes are fixed on the point P?

As is shown in fig. 3 the image-points on both sides lie further apart for H or nearer together for V than the image-points for P, and for all the points on the horopter (Q, R, S, T &c.), whether the points H and V are situated inside or outside the horopter. In other words, if the point H be formed in the object-space by the moving of the related points Q (or R) towards H, then a movement of the image-point takes place in the right eye (or the left), in both eyes in the direction of the nose, so long as the point H is outside the horopter. On the contrary an external movement of the image-point, *i.e.* towards the temples, takes place when the points S and T are substituted by the point V situated inside the horopter. This differentiation of the retinal images of the points H and V respectively inside and outside the horopter must suffice, and the question as to how the idea of space is conveyed to the brain is a physiological and psychological subject.

If the images of the line PH in both eyes (or of the line PV) are very different in length, the double images of the point H (or V) are seen without great attention. But the stereoscopic effects are in these cases always the same as before. There is, however, an exception in which the observer sees only two images and in which stereoscopic observation is completely excluded. This exception is important because it occurs in the space in the immediate proximity of P. If for example the second point (H′ in fig. 3) is situated behind or in front of the point P, so that it falls between the two optic axes, or on one of them, then only double images can be seen, either of P or of H′, according to whether the optic axis cuts at P or H′, or double images of both points if the optic axes intersect at any other point of the line PH′, but the representation of the difference of depth of the two points P and H′ is never obtained.

This fact can be easily realized if a stick, *e.g.* a lead pencil, be held before the eyes of an observer with good stereoscopic sight so that its lengthwise axis falls exactly on a point between the eyes or in the middle of one of the two eyes. The double images can be seen still more clearly if two small balls on thin threads are suspended behind one another so that their connecting line retains the position mentioned above. In this experiment it can be seen directly how inconvenient these double images are to the observer. He involuntarily tries to evade them by moving the head. The reason for this is that, when P (or H′) is fixed, the images of H′ (or P) are always separated from one another by the centre of the yellow spot. The distances of the two images from the yellow spot have consequently opposite signs, whilst for all other objects (*e.g.* H) which lie outside the two axes the distances have the same signs. The difference of the sign is, however, not alone decisive, for if the connecting line PH′ is moved a little higher or lower out of the plane FPF the signs remain different, but the stereoscopic effect is immediately regained. Therefore in all cases in which the connecting line PH′ is seen with one eye as a point and with the other as a line, or with both eyes as a line, but from two diametrically opposite sides, there is no stereoscopic effect, but double images are seen; and that for stereoscopic observation it is essential to see the connecting line PH′ *with both eyes simultaneously from one and the same side*, from above or below, from the left or the right. This condition is provided for in the stereotelemeter by the arrangement of a zigzag measuring scale, so that the connecting-line of the marks slightly ascends. Care must be taken when using this instrument (as also when using any stereoscopic measuring instrument) that the index hangs close to or above the object to be measured, so that the latter is only touched and in no way covered by the mark.

The power of perception of depth in man is most accurate. This has been ascertained by the approximately equal keenness of vision of all normal-sighted people and by the interpupillary distance. The angle which serves as a measure for the keenness of vision is that under which appear two neighbouring points of the object-space which are still seen by the single eye as a double point; according to the older experiments of Helmholtz, this angle is about 1′. When measured on the retina the keenness of vision is determined by the diameter of the nerve filaments situated in straight rows close to one another in the fovea (fig. 4). The diameter of these filaments amounts to roughly 0·005 mm., or in angular measure 1′. More recent experiments for keenness of vision and power of perception of depth have given considerably higher values (Wülfing, Pulfrich, Heine and others); thus Pulfrich in 1899, when first introducing stereoscopic instruments for measuring distance, proved that as a rule persons with normal eyes have a power of perception of depth of 10″ and still less in unrestricted vision. This is explained as follows (Hering, Heine):—

It is unimportant for perception where the filament mentioned above is illuminated. In order to see two objects lying close to one another it is not essential that the two image-points should be separated from one another by the distance of the two nerve filaments of the eyes. This happens whenever the line separating two objects passes through the two points (see fig. 4). It is natural that the perception of depth has no fixed limits, for the position of the images shown in fig. 4 changes with the movement of the eyeball, and the closer the two points are to one another, the more

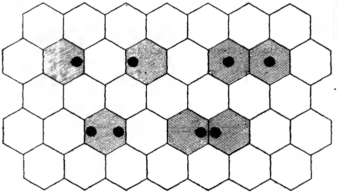

Fig. 4.

rarely it occurs. If the angle of convergence of the optic axes $=\Delta$, the (average) distance between the eyes $B=65$ mm., $\delta=\frac{1}{2}'$ relatively $= 1:7000$ (the perception of depth easily attained by normal sight) and $E=$ the normal distance of the point P from B in fig. 2, then from $E=B/\Delta$, the change of depth dE gives:—

$$dE = B\,.\,\delta/\Delta^2 = E\,.\,\delta/\Delta = E^2\,.\,\delta/B.$$

If the angle Δ has the value δ then all perception of depth ceases. At this distance objects are only still distinguishable from those lying behind them, which together form a surface but cannot always be seen as a surface because our representations of the depths of distant objects are not conclusively controlled by stereoscopic sight. This distance is called the radius of the stereoscopic field, and is calculated by the formula $R=B/\delta$, whence $R=450$ metres. From the above formulae it can be directly seen that the variation dE increases with E^2, and the proportional variation dE/E increases with E. The numerical values can be easily calculated when either Δ or E is given thus:

$$dE/E = \delta/\Delta \text{ or } dE/E = E/R.$$

The limits of stereoscopic vision defined above can be extended and under the name of "stereoscope" every binocular instrument is included which serves this end. Those instruments should first be mentioned which have restored the more or less lost power of stereoscopic vision. It is necessary for those with normal sight to wear spectacles when the eyes cease to accommodate themselves to objects near at hand. Spectacles which only cover the lower half of the eye and leave the upper

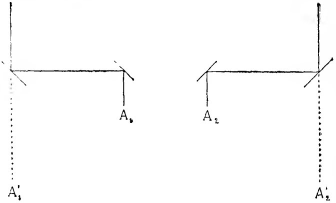

Fig. 5.

half free to look out into space are the best. For those who have been operated on for cataract, and for excessively short-sighted persons, the "telescope-spectacles" devised by M. v. Rohr (of Zeiss, Jena) are a great assistance. There are two methods of extending the limits of stereoscopic vision and of increasing the accuracy of the perception of depth. (1) by augmenting the keenness of sight by the aid of a telescope or microscope, and (2) by increasing the interpupillary distance by several reflections after the plan shown by Helmholtz in his mirror stereoscope (1857) (see fig 5). When binocular telescopes and microscopes are used, erect images are formed when the two instruments are contiguous. If this is not the case, the order of depth is reversed and the same false or pseudo-images are formed as when the pictures in a stereoscopic view are interchanged or a correctly combined stereoscopic picture is observed in a so-called pseudo-stereoscope. If, however, in this case the axes of both instruments intersect in front of the eyes, then reversed pictures are obtained, but the correct order of depth is recovered.

Telescope magnification (m times) and base magnification (n times) bring the radius R of the stereoscopic field to m or n times respectively the value above given, and if both are simultaneously active to mn times. The errors for a certain distance E are accordingly reduced to $1/mn$. Of course these expedients do not increase the capability of the observer, but the values of the convergence angle Δ and δ in the object-space are different. It is therefore quite natural that the three-dimensional images, which appear in the binocular vision-space of the observer, vary with reference to their dimensions and the distance of the separate parts from each other. In this respect the action of the base magnification is fundamentally different from that of the telescope magnification. Both bring the objects m or n times respectively nearer to the observer, but in the first case the areal dimensions are diminished in the same proportion as the distances are lessened, whilst in the other case the real dimensions remain unchanged. In the first case the three-dimensional image is a model proportionately diminished in all its dimensions and brought nearer to the observer: in the other case the objects appear pushed together to the front like the wings of a theatre. The remark made in Helmholtz's *Physiological Optics* that when $m=n$ the three-dimensional image would look like the object seen without any instrument at a distance of $1/n$ is consequently not correct. What is remarkable is that this observation, to which as a so-called "Helmholtz rule" great importance was for a long while attached, and to a certain extent still is, does not correctly express the views of Helmholtz, which he states very clearly in his earlier essay on the tele-stereoscope, and which agree with the explanation here given.

Spectacles and binocular telescopes were the first binocular instruments (see Binocular Instruments). The latter with chromatic lenses had already been constructed in the 17th and 18th centuries. The Dutch double-telescope (opera glasses), which were almost exclusively used up to the 'nineties of the 19th century, were introduced in the 'thirties by Fr. Voigtländer. The binocular microscope appeared in the early 'fifties. The introduction of the Porro prism (four reflections with reversion of the picture and lateral transposition of the rays) by Abbe in 1893 was of great importance for the binocular telescope and microscope. It led to the construction of the prism field-glasses and other telescopes which, in comparison with the Galileo binocular telescopes till then in use, not only had a considerably increased perception of depth but also a substantially larger field of vision. Similarly by inserting the Porro inverting system between the eyepiece and the objective, the binocular microscope constructed by H. S. Greenough and S. Czapski was produced. Recently binocular glasses (after Fritsch and Zeiss) have come into use for slight magnifications, in which, following the example given by Wenham (1853), the interpupillary distance and the angle of convergence are diminished by four reflections (the course of the rays reversed as in fig. 5).

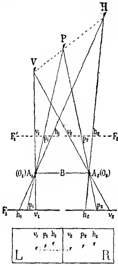

Fig. 6.

All of the instruments mentioned above are used exclusively for the observation of three-dimensional objects with two eyes. Wheatstone (1838) first showed that the same spatial impression could be produced by two views of the object taken from two different points and he called the instrument a stereoscope. Let us imagine in fig. 6 a plane F_1' F_2' between the two eyes A_1 and A_2 and the points P, H and V in the object-space, and on this plane the perspective projections of P, H and V produced towards A_1 and A_2—as, for example, by photographing on the plates F_1 and F_2 with objectives O_1 and O_2 at A_1 and A_2—then the object can be taken away and we obtain from the projections the same spatial effect as when observing the object itself. The change of accommodation of the eye which, however, has no influence on the power of perception of depth, is excluded, and a further difference (according to I. I. Oppel, 1854) is that in unrestricted vision the image-points not situated on the yellow spot undergo slight displacement in consequence of the difference of the position of the pupil and of the centre of rotation of the eye, which is taken as the centre of projection. This can in no way be imitated in the pictures. In order to obtain a stereoscopic effort from such pictures apparatus is not always necessary. When the pictures L and R in fig. 6 are at a distance equal to that of distinct vision, the stereoscopic effect can be obtained by observing them when the optic axes of the eyes are parallel, and if the pictures are interchanged, when the axes intersect. The second of these methods, which were discovered by Wheatstone, was later widely used for the stereoscopic observation of large wall pictures.

The 1852 model of the Wheatstone stereoscope is shown diagrammatically in fig. 7. This differs from the original model in that the pictures L and R can be placed at different inclinations to the mirrors s_1 and s_2 and at different distances from them in order to observe the pictures under exactly the same inclination of the image and the same angle of convergence as when the picture was taken. Photographs with a large base line and converging axes were then often taken (in Germany first by L. Moser). This mirror stereoscope had no practical result worth mentioning on account of its awkward shape and of the difficulty in obtaining equal illumination of both pictures. It was also inconvenient that the pictures had to be placed separately and reversed in the apparatus. These difficulties are for the greater part avoided in the L. Pigeon (Nancy, 1905) new mirror-stereoscope for large pictures, which can be purchased in book form. Fig. 8 shows diagrammatically the arrangement by which one picture is seen direct and the other in a mirror (H. W. Dove, Sir David Brewster and W. Rollmann). The disadvantage attached to this, that the picture observed in the mirror must be reversed, can according to Pulfrich[1] be obviated by rotating the correct picture through 180° in its own plane and placing it in the position of the picture L and by using a so-called roof-prism in the place of the mirror.

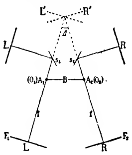

FIG. 7.

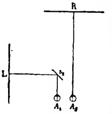

FIG. 8.

Incorrect stereoscopic effects easily arise when using pictures. If for instance the distance of a picture from the centre of projection is different at the time of observation from what it was when the photograph was taken (see fig. 9), objects appear to be either too much in relief or too flat even in monocular vision, just as when looking first through the objective of a telescope and then through the eyepiece. An excellent example is provided by the stereoscopic observation of the moon, first performed by Warren de la Rue (1858) to show that the three-dimensional image is modified by altering the angle of convergence and by placing the pictures obliquely. If the pictures obtained with converging axes are placed further apart on the same plane, the stereoscopic image of the moon has the shape of an egg; this, however, immediately disappears and changes into an approximate sphere, if the picture be broken in the middle and both sides bent back. If the pictures are observed, as by Warren de la Rue, in a Wheatstone stereoscope under exactly the same conditions as when the photographs were taken, the impression of a sphere is obtained.

M. von Rohr (*Die binocularen Instrumente*, 1907) drew attention to the optics of the older stereoscopists and in particular to the works of Wheatstone, and it is to be regretted that so little notice was taken of these older works during the recent development of most binocular instruments. It would, however, be erroneous to demand that the above-mentioned conditions for the observation of three-dimensional images should always be considered. This is impossible, for example, in the stereo-comparator in which the three-dimensional image is only seen in portions, and never all at once. Neither does it concern stereoscopic measuring instruments, and it is a curious coincidence that the stereo-planigraph (see fig. 15) constructed after Wheatstone's stereoscope, and correct as to the so-called orthomorphy of the three-dimensional image, was of no use as a measuring instrument.

[1] This fact is published here for the first time.

A lens-stereoscope invented in 1849 by Sir David Brewster and constructed by J. Duboscq is very largely used. The causes of its success were its convenient form and the fact that a series of adjusted stereoscopic pictures (landscapes, machines,

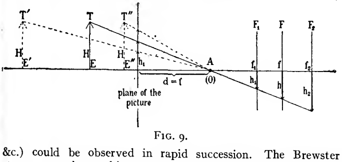

FIG. 9.

&c.) could be observed in rapid succession. The Brewster stereoscope, by making an easy observation of stereoscopic pictures possible when the distance between identical points on both pictures was considerably greater than that between the observer's eyes, supported to a certain extent the inclination of photographers not to detract from the pictures. If the lenses shown in fig. 10, on the focal plane of which the stereoscopic image is formed, are large enough, and the distance between the image-points h_1 and h_2 is not greater than the distance between the centres of the two lenses (avoiding the divergence of the axes of the eyes), then the distance between the eyes is secondary and the observer sees the distant points with the axes of the eyes parallel. These apparent advantages, however, are counteracted by the defect that the picture seen through the lenses is eccentric, and consequently an incorrect impression of the picture is obtained, and an alteration in the three-dimensional image occurs.

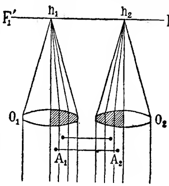

FIG. 10.

Wheatstone showed later in his controversy with Brewster that this disadvantage in the lens-stereoscope could be avoided by

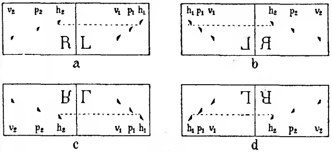

FIG. 11.

adjusting the lenses and distant points to the distance between the observer's eyes. This same condition was fulfilled in the "double-verant" constructed by v. Rohr and A. Köhler (1905), in which the lenses, in accordance with A. Gullstrand's rule, are so arranged that the centre of rotation of the eye always coincides with the nodal point of the lenses. If every one had the same inter-pupillary distance there would be nothing more perfect than this stereoscope.

If in fig. 6 the two pictures L and R are interchanged in both pictures (*a* or *b* in fig. 11), then the image-points for H are closer together than those for V; thus in stereoscopic vision H appears in front of P, and V behind it. No change is made to the relief by turning the picture upside down (*c* and *d* in fig. 11). In fig. 11*d*, the pictures are in the same positions as when the photographs are taken (F_1, F_2 in fig. 6). Obviously transparent pictures can be easily reversed; in other cases it must be effected by mirrors (Wheatstone, Dove and others) or by an erecting reflection prism. The original unbroken plate (fig. 11*d*) can be seen in the pseudo-stereoscope shown in fig. 12, and the correct relief is obtained if it is rotated about the connecting line of the two pictures before placing in the stereoscope. If a symmetrical body be observed in the pseudo-stereoscope, for example a pyramid, the relief is still reversed. But if a prism be dispensed with the object appears flat, and a plane drawing appears in relief.

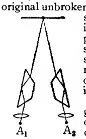

FIG. 12.

These pseudo-stereoscopic phenomena are of the greatest importance for the study of the principles of stereoscopy, for they demonstrate that the perception of depth can be aided by a direct presentation and hindered by a reverse presentation. If a plate of the dolomites, for example, with a large base line, arranged as in 11*a* and 11*b* is taken, and the apparatus and the eyes are directed upwards, then the pseudomorphic image in space looks like the roof of a stalactite cave. On the other hand, when arranged as 11*c* and 11*d* the image appears correctly represented, but it is a little more difficult to see the horizon in the foreground of the pseudomorphic image. Reference can only be made here to the physiologically interesting phenomena of colour-tones, which are a result of the chromatism of the eye and occur in monocular and binocular vision (Dove and, more recently, A. Brückner).

A comparatively simple solution to the problem of putting pictures seen in a stereoscope in motion is provided in the *mutoscope* for a single observer. The other problem—to make one stereoscopic picture visible to several people simultaneously—can be met in various ways, most simply (according to Rollmann [1853] and D'Almeida [1858]) by portraying the two stereoscopic pictures in different colours one over the other, and giving each observer spectacles of different coloured glass for each eye, with which it is only possible to see one picture with each eye. Another method suggested by I. Anderton (1891), in which polarization and a Nicol prism must be used to separate the pictures, has met with little success, and F. E. Ives's novel proposal (1903) to separate the pictures when being taken and also observed by a ruled grating placed immediately in front of the photographic plate is not practicable. A method devised by D'Almeida, which depended upon the alternate visibility of the two pictures, demands a mechanism for each observer, exactly synchronous with the intermittent illumination. This principle was successfully adopted by J. Mackenzie Davidson and H. Boas (1900) for a direct stereoscopic observation of Röntgen radiographs. Immediately after the discovery of the Röntgen rays in 1895, E. Mach made stereoscopic investigations of these radiographs.

The development of stereoscopy has in no way been uniform; on the contrary, a long period, during which practically no interest was taken in stereoscopy or stereoscopic phenomena, was preceded during the middle part of the 19th century by a period of universal interest. The reason for this was not so much the realization of the defects of the stereoscopes in themselves, and the trivial manner in which they were put on the market, as, for example, a closing stereoscope containing confectionery, as the fact that the public did not know how to make use of the pictures seen in the stereoscope. This state of affairs was altered when Zeiss, of Jena, as a result of the investigations of E. Abbe and C. Pulfrich, succeeded in constructing apparatus which made it possible to measure the three-dimensional images.

The stereotelemeter, constructed after H. de Grousilliers' idea, appeared in 1899. This is a double telescope with the distance between the objectives increased, and a number of rows of marks placed in the plane of the image which appear as real objects floating at fixed distances above the landscape, from which the distances of the objects in the view can be easily read. In 1905 Pulfrich devised a method of stereoscopic measurement which is specially interesting from a physiological point of view, but which can only be employed for isolated objects, such as beacons, signals, &c. This method has the peculiarity that no marks are necessary for the measurement. The binocular telescope is so arranged that it always produces two three-dimensional images of the object which is to be measured close to one another, which as a rule are seen as though they were at different distances and of different sizes. The measurement is made by causing the difference of relief of the two images to disappear either by bringing the instrument nearer to the object or by readjusting the apparatus. The equal size of the two three-dimensional images can be regarded as a criterion of their equal distances; and it is of further advantage to the method that the images to be compared are equal as to definition and colour.

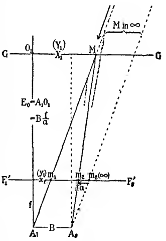

FIG. 13.

A consequence of these instruments, which are chiefly important for military surveying, was the Pulfrich stereocomparator devised in 1901. The stereoscopic measuring machine invented by H. G. Fourcade of Capetown (1902) is similar to this in many points. These instruments inaugurated the successful measurement of the distances of distant objects and the uses of stereoscopy were consequently increased. Measurement is not made of the objects themselves, but on photographic plates which are taken with special instruments—field- and stand-phototheodolites—at the extremities of a base-line which is always selected according to the distance of the object

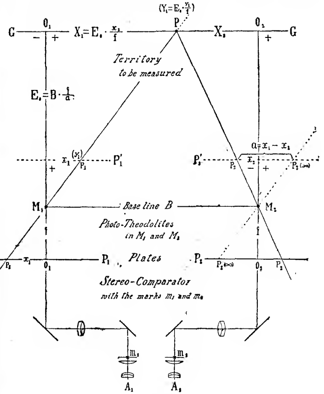

FIG. 14.

and the exactitude of measurement needed. For measuring the pictures a binocular microscope, adjusted to the dimensions and the distance between the two plates, is used, and a fixed mark is placed in each image plane which combine in binocular view to a virtual mark in the three-dimensional image. If the plates are correctly adjusted, by moving the plates perpendicular to one another and by altering the distance of the plates from one another, this so-called "travelling mark" can be placed on any point of the landscape, and then used for the measurement of solidity of the objects, or the production of plans and models, just as formerly, for example, the measuring staff was used for geodetic observations, with the difference that in the stereocomparator the mark is regulated by the observer only and is not hindered in its movements by any undulations, &c., of the land.

Fig. 13 shows how the lateral movement of the mark m_2 is transformed in a movement towards and away from the observer in the three-dimensional image M. Fig. 14 shows the theory of measuring a stereophotograph. The axes are horizontal when the photograph is taken, and the plates are in one plane. It shows the method of calculating the position of the point P in the object-space from the co-ordinates x_1 and y_1 of image-point on the left plate and the so-called parallel axis $a=x_1-x_2$; the last is constant for all points in the vertical plane GG through P at right angles to M_1O_1. The two microscopes in fig. 14 really produce erect pictures, and the two plates are so placed in the stereocomparator as to be seen from P_1' and P_2'.

The use of the stereocomparator is unlimited for the measurement of relief. It is extended similarly to all objects and phenomena, large and small, distant and near, in motion or stationary, to those which retain their shape for a long period or which are constantly changing, or to those which are only visible for a short time. For a large number of experiments of this sort—mountain photography (Von Hübl, &c.), coastal measurements, photographing a battle from a ship, geodesy, study of the waves (Kohlschütter, Laas), the trajectory of a shot (Neuffer, Krupp, Neesen), the use in building railways or on voyages of discovery, &c.—the stereocomparator has given proofs of its uses and new fields are being constantly opened up for it. A further advance has been made in the stereophotogrammetric method by providing the stereocomparator with a drawing apparatus (F. V. Thomson, E. v. Orel and Carl Zeiss), with which contours can be automatically drawn from the stereophotogrammetric photographs. E. Deville's (1903) stereoplanigraph (fig. 15), designed for the same purpose, is only used as a demonstration apparatus. The mirrors are transparent for the observation of a source of light, &c., which is moved in the object-space.

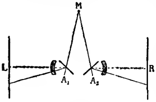

FIG. 15.

The stereometer may be regarded as a modification of the stereocomparator, and is constructed for the measurement of men and animals, and also for sculpture, and for the observation of complete stereoscopic photographs. The motion of the mark is effected by a lateral movement of one of the two objectives forming the picture. Pulfrich has recently provided the Greenough binocular microscope with a point or a circular mark situated exactly in the centre of the field of view for the purpose of the direct gauging of small preparations which cannot be directly brought into contact with a mark. This contact with the preparation is effected by displacing either the preparation or the microscope, and the separate distances are read with a vernier.

The earlier suggestions for making the stereoscope a measuring instrument were not realized though decisive improvements were made. Brewster was unconsciously near the solution of the problem when he prepared ghosts or vistas by placing one transparent picture over another. More important than these trivial pictures are the superposed pictures (of conic sections, machines, anatomical preparations, &c.) contrived by E. Mach (1866) in which sections of the same solid object are successively photographed on one plate so that in a stereoscope one can see, as it were, through the opaque surface of the solid into the interior. To A. Rollet (1861) is due the merit of constructing the first stereoscopic measuring scale. It was a sort of ladder, whose rungs gave the distances of objects. Shortly after Mach suggested using the mirror image of a wire model observed in a transparent mirror for the measurement of the dimensions of a body placed behind the glass plate.

The works of I. Harmer (1881) and F. Stolze (1884 and 1892) are of importance for the history of the development of stereoscopic measurement. Harmer used a scale of depth consisting of a series of squares arranged one behind the other in order to measure in the stereoscope a picture of the clouds taken with a large base-line (about 15 metres). Stolze placed gratings in front of the two semi-pictures of a mirror stereoscope, one of which could be moved by a micrometer, and he thus discovered the device called the "travelling mark." Apparently independent of all earlier experimenters T. Marie and H. Ribaut had the idea of the "travelling mark" in 1899 and 1900 and used it for measuring the Röntgen radiographs.

Of the applications of stereoscopy we may notice the utilization of spatial effects and troubles in stereoscopic vision (agitation and lustrous appearances) in the discovery of differences and alterations in pictures. The method was first used by Brewster to recognize irregularities in carpet patterns, and later by Dove and others for distinguishing the original from a copy, for testing coins, cheques, &c. Moreover, with the development of celestial photography, the stereoscope came to be applied to the discovery of planets, comets, variable stars, errors in plates, the proper motions and parallaxes of the fixed stars (Harmer, Kummel, Wolf and Lenard, Förster and others).

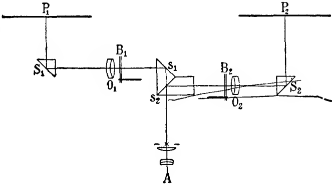

FIG. 16.

The stereocomparator has also been employed in astrometry, and a planetoid discovered by its aid was named Stereoscopia in recognition of this application. Since 1904 binocular observation of stellar plates to determine differences in the images of the objects reproduced has been gradually discarded for the method devised by Pulfrich, which consists in the monocular observation of the two plates in the stereocomparator with the assistance of the so-called "blink" microscope (fig. 16). In this microscope the two pictures are seen simultaneously, or individually by alternately opening the screens B_1 and B_2. In the second case all differences of the two images are immediately distinguished by a sudden oscillation of the image-point or by a sudden appearance and disappearance of single points like flash lights at sea or the modern illuminated sky lights in towns, and there is now no merit in discovering new planets, comets and variable stars by this method.

The blink microscope is far more useful than the stereomicroscope for such purposes, for there is not one special direction in which differences can be best distinguished. It is better therefore for the stereo method to be restricted to the work for which it is specially suitable, and for which it will never be replaced, and for such experiments as we have just discussed to be solely performed with the aid of the blink microscope. (C. P.*)

STERLING, ANTOINETTE (d. 1904), Anglo-American vocalist, was born at Sterlingville, New York state. She studied with Mme Marchesi, with Mme Viardot Garcia and with Manuel Garcia, and after singing for two years in America came in 1873 to England, where she made her first appearance at Covent Garden under Sir Julius Benedict and rapidly became a popular favourite among the contraltos of the day. She gained her greatest successes as a ballad-singer, especially in such songs as "Caller Herrin'," "The Three Fishers" and "The Lost Chord." She was a woman of deep religious feeling and many enthusiasms, and her name was constantly associated with philanthropic enterprise. She died on the 10th of January 1904. In 1875 she had married Mr John Mackinlay, and her life was written by her son, Mr Sterling Mackinlay, in 1906.

STERLING, JOHN (1806–1844), British author, was born at Kames Castle in Bute on the 20th of July 1806. He belonged to a family of Scottish origin which had settled in Ireland during the Cromwellian period. His father, Edward Sterling (1773–1847), had been called to the Irish bar, but, having fought as a militia captain at Vinegar Hill, afterwards volunteered with his company into the line. On the breaking up of his regiment he went to Scotland and took to farming at Kames Castle. In 1804 he married Hester Coningham. In 1810 the family removed to Llanblethian, Glamorganshire, and during his residence there Edward Sterling, under the signature of "Vetus," contributed a number of letters to *The Times*, which were reprinted in 1812, and a second series in 1814. In the latter year he removed to Paris, but on the escape of Napoleon from Elba in 1815 took up his residence in London, obtaining a position on the staff of *The Times* newspaper; and during the late years of Thomas Barnes's administration he was practically editor. His fiery, emphatic and oracular mode of writing conferred those characteristics on *The Times* which were recognized in the sobriquet of the "Thunderer." John Sterling was his second son, the elder being Colonel Sir Anthony Coningham Sterling (1805–1871), who besides serving in the Crimea and as military secretary to Lord Clyde during the Indian Mutiny, was the author of *The Highland Brigade in the Crimea* and other books. After studying for one year at the university of Glasgow, John Sterling in 1824 entered Trinity College, Cambridge, where he had for tutor Julius Charles Hare. At Cambridge he took a distinguished part in the debates of the union, and became a member of the "Apostles'" Club, forming friendships with Frederick Denison Maurice and Richard Trench. He removed to Trinity Hall with the intention of graduating in law, but left the university without taking a degree. During the next four years he resided chiefly in London, employing himself actively in literature and making a number of literary friends. With Maurice he purchased the *Athenaeum* in 1828 from J. Silk Buckingham, but the enterprise was not a pecuniary success. He also formed an intimacy with the Spanish revolutionist General Torrijos, in whose unfortunate expedition he took an active interest. But he did not accompany it, as he was kept in England by his marriage to Susannah, daughter of Lieut.-General Barton. Shortly after his marriage in 1830 symptoms of pulmonary disease induced him to take up his residence in the island of St Vincent, where he had inherited some property, and he remained there fifteen months before returning to England. After spending some time on the Continent in June 1834 he was ordained and became curate at Hurstmonceaux, where his old tutor Julius Hare was vicar. Acting on the advice of his physician he resigned his clerical duties in the following February, but, according to Carlyle, the primary cause was a divergence from the opinions of the Church. There remained to him the "resource of the pen," but, having to "live all the rest of his days as in continual flight for his very existence," his literary achievements were necessarily fragmentary. He published in 1833 *Arthur Coningsby*, a novel, which attracted little attention, and his *Poems* (1839), the *Election, a Poem* (1841), and *Strafford*, a tragedy (1843), were not more successful. He had, however, established a connexion in 1837 with *Blackwood's Magazine*, to which he contributed a variety of papers and several tales of extraordinary promise not fulfilled in his more considerable undertakings. Among these papers were "The Onyx Ring" and "The Palace of Morgana." He died at Ventnor on the 18th of September 1844, his wife having died in the preceding year.

His son, Major-General John B. Sterling (b. 1840), after entering the navy, went into the army, and had a distinguished career (wounded at Tel-el-Kebir in 1882), both as a soldier and as a writer on military subjects.

John Sterling's papers were entrusted to the joint care of Thomas Carlyle and Archdeacon Hare. *Essays and Tales*, by John Sterling, collected and edited, with a memoir of his life, by Julius Charles Hare, appeared in 1848 in two volumes. So dissatisfied was Carlyle with the memoir that he resolved to give his own "testimony" about his friend, and his vivid *Life* (1851) has perpetuated the memory of Sterling more than any of the latter's own writings.

STERLING, a city of Whiteside county, Illinois, U.S.A., on the north bank of Rock river, 109 m. by rail W. of Chicago. Pop. (1900), 6309, of whom 815 were foreign-born and 23 were negroes; (1910), 7467. Sterling is served by the Chicago & North-western and the Chicago, Burlington & Quincy railways, and by inter-urban electric railway to Dixon, 12 m. N.N.W. Across the river is Rock Falls (pop. in 1910, 2657), practically a suburb of Sterling, with foundries and machine-shops and manufactories of agricultural implements, barbed wire and bolts and rivets. Three bridges cross the river. The river is tapped here by the feeder of the Illinois & Michigan Canal, so that there is direct water communication with Chicago and St Louis. Two great dams on the river (one built by the Federal government) provide good water power. The public library (1878) had 12,000 volumes in 1910. In the city are large ironworks, and numerous other manufactures. Sterling was formed in 1839 by the consolidation of two towns, Harrisburg and Chatham, founded here in 1836 and 1837 respectively; it was chartered as a city in 1857.

STERLING, a term used to denote money of standard weight or quality, especially applied to the English gold sovereign, and hence with the general meaning of recognized worth or authority, genuine, of approved excellence. The word has been generally derived from the name of "Easterlings" given to the North German merchants who came to England in the reign of Edward I. and formed a *hansa* or gild in London, modelled on the earlier one of the merchants of Cologne. Their coins were of uniform weight and excellence (cf. Matthew Paris, ann. 1247, *moneta esterlingorum, propter sui materiem desiderabilem*, &c.), and thus it is supposed gave the name of the moneyers to a coinage of recognized fineness. This theory is based on the statement of Walter de Pinchbeck, a monk of the time of Edward I., "sed moneta Angliae fertur dicta fuisse a nominibus opificum, ut Floreni a nominibus Florentiorum, ita *Sterlingi* a nominibus Esterlingorum nomina sua contraxerunt, qui hujusmodi monetam in Anglia primitus componebant" (quoted in Wedgwood, *Dict. of Eng. Etym.*). The word, however, occurs much earlier. The *Roman de Rou* (1180) has "Pour ses estellins recevoir," and "in Anglia unus Sterlingus per solvetur" occurs in an ordinance of Philip of France and Henry II. of England of 1184, both quoted in Du Cange (*Gloss. s.v.* Esterlingus). The "sterling" was a coin, the silver penny, 240 of which went to the "pound sterling" of silver of 5760 grains, 925 fine, and described in a statute of Edward I., quoted in Du Cange, as "Denarius Angliae qui vocatur Sterlingus." The word was borrowed by all European languages and applied to the English coin and to coins in general of a standard quality; thus we find not only O. Fr. *estorlin* or *estellin* but M. H. G. *sterlinc* or *staerlinc*, Ital. *sterlino*, &c. It would seem therefore that the term was applied to a coin of recognized quality before the North German merchants were established in London and that its origin should be found in a native English word. Two suggestions have been made; one that it represents an O. Eng. *steorling, i.e.* little star, from a device on an early coin, such as is found on some of William II., or O. Eng. *staerling*, starling, from the birds, which however may be doves, on the coins of Edward the Confessor. (See Du Cange, *Gloss. s.v.* Esterlingus; and Skeat, *Etym. Dict.* 1910, *s.v.* Sterling.)

STERNBERG, a town of Austria, in Moravia, 73 m. N.E. of Brünn by rail. Pop. (1900), 15,195, almost exclusively German. It is the chief seat of the Moravian cotton industry, and it also carries on the manufacture of linen, stockings, liqueurs, sugar and bricks. Fruit, especially cherries, and tobacco are grown in the neighbourhood. Sternberg is said to have grown up under the shelter of a castle founded by Yaroslav of Sternberg on the site of his victory over the Mongols in 1241.

STERNE, LAURENCE (1713–1768), English humorist, was the son of Roger Sterne, an English officer, and great-grandson of an archbishop of York. Nearly all our information about the first forty-six years of his life before he became famous as the author of *Tristram Shandy* is derived from a short memoir jotted down by himself for the use of his daughter. It gives nothing but the barest facts, excepting three anecdotes about his infancy, his school days and his marriage. He was born at Clonmel, Ireland, on the 24th of November 1713, a few days after the arrival of his father's regiment from Dunkirk. The regiment was then disbanded, but very soon after re-established, and for ten years the boy and his mother moved from place to place after the regiment, from England to Ireland, and from one part of Ireland to another. The familiarity thus acquired with military life and character stood Sterne in good stead when he drew the portraits of Uncle Toby and Corporal Trim. After ten years of wandering, he was fixed for eight or nine years at a school at Halifax in Yorkshire. His father died when he was in his eighteenth year, and he was indebted for his university education to one of the members of his father's family. His great-grandfather the archbishop had been master of Jesus College, Cambridge, and to Jesus College he was sent. He was admitted to a sizarship in July 1733, took his B.A. degree in 1736 and proceeded M.A. in 1740. One of his uncles was precentor and canon of York. Young Sterne took orders, and through this uncle's influence obtained in 1738 the living of Sutton-in-the-Forest, some 8 m. north of York. Two years after his marriage in 1741 to a lady named Elizabeth Lumley he was presented to the neighbouring living of Stillington, and did duty at both places. He was also a prebendary of York Cathedral.

Sutton was Sterne's residence for twenty uneventful years. He kept up an intimacy which had begun at Cambridge with John Hall-Stevenson (1718–1785), a witty and accomplished epicurean, owner of Skelton Hall ("Crazy Castle") in the Cleveland district of Yorkshire. Skelton Hall is nearly 40 m. from Sutton, but Sterne, in spite of his double duties, seems to have been a frequent visitor there, and to have found in his not too strait-laced friend a highly congenial companion. Sterne is said to have never formally become a member of the circle of gay squires and clerics at Skelton known as the "Demoniacks"; but no doubt he shared their festivities. Stevenson's various occasional sallies in verse and prose—his *Fables for Grown Gentlemen* (1761–1770), his *Crazy Tales* (1762), and his numerous skits at the political opponents of Wilkes, among whose "macaronies" he numbered himself—were collected after his death, and it is impossible to read them without being struck with their close family resemblance in spirit and turn of thought to Sterne's work, inferior as they are in literary genius. Without Stevenson, Sterne would probably have been a more decorous parish priest, but he would probably never have written *Tristram Shandy* or left any other memorial of his singular genius. In 1747 Sterne published a sermon preached in York under the title of *The Case of Elijah*. This was followed in 1750 by *The Abuses of Conscience*, afterwards inserted in vol. ii. of *Tristram Shandy*. In 1759 he wrote a skit on a quarrel between Dean Fountayne and Dr Topham, a York lawyer, over the bestowal of an office in the gift of the archbishop. This sketch, in which Topham figures as Trim the sexton, and the author as Lorry Slim, gives an earnest of Sterne's powers as a humorist. It was not published until after his death, when it appeared in 1769 under the title of *A Political Romance*, and afterwards the *History of a Warm Watch-Coat*. The first two volumes of *Tristram Shandy* were issued at York in 1759 and advertised in London on the 1st of January 1760, and at once made a sensation. York was scandalized at its clergyman's indecency, and indignant at his caricature as "Slop" of a local physician (Dr John Burton); London was charmed with his audacity, wit and graphic unconventional power. He went to London early in the year to enjoy his triumph, and found himself at once a personage in society—was called upon and invited out by lion-hunters, was taken to Windsor by Lord Rockingham, and had the honour of supping with the duke of York.

For the last eight years of his life after this sudden leap out of obscurity we have a faithful record of Sterne's feelings and movements in letters to various persons, published in 1775 by his sole child and daughter, Lydia Sterne de Medalle, and in the *Letters from Yorick to Eliza* (1766–1767), also published in 1775. At the end of the sermon in *Tristram* he had intimated that, if this sample of Yorick's pulpit eloquence was liked, "there are now in the possession of the Shandy family as many as will make a handsome volume, at the world's service, and much good may they do it." Accordingly, when a second edition of the first instalment of *Tristram* was called for in three months, two volumes of *Sermons* by Yorick were announced. Although they had little or none of the eccentricity of the history, they proved almost as popular. Sterne's clerical character was far from being universally injured by his indecorous freaks as a humorist: Lord Fauconberg presented the author of *Tristram Shandy* with the perpetual curacy of Coxwold. To this new residence he went in high spirits with his success, "fully determined to write as hard as could be," seeing no reason why he should not give the public two volumes of Shandyism every year and why this should not go on for forty years. By the beginning of August 1760 he had another volume written, and was so "delighted with Uncle Toby's imaginary character that he was become an enthusiast." The author's delight in this wonderful creation was not misleading; it has been fully shared by every generation of readers since. For two years in succession Sterne kept his bargain with himself to provide two volumes a year. Vols. iii. and iv. appeared in 1761; vols. v. and vi. in January 1762. But his sanguine hopes of continuing at this rate were frustrated by ill-health. He was ordered to the south of France; it was two years and a half before he returned; and he came back with very little accession of strength. His reception by literary circles in France was very flattering. He was overjoyed with it. "'Tis *comme à Londres*," he wrote to Garrick from Paris; "I have just now a fortnight's dinners and suppers upon my hands." Through all his pleasant experiences of French society, and through the fits of dangerous illness by which they were diversified, he continued to build up his history of the Shandy family, but the work did not progress as rapidly as it had done. Not till January 1765 was he ready with the fourth instalment of two volumes; and one of them, vol. vii., leaving the Shandy family for a time, gave a lively sketch of the writer's own travels to the south of France in search of health. This was a digression of a new kind, if anything can be called a digression in a work the plan of which is to fly off at a tangent whenever and wherever the writer's whim tempts him. In the first volume, anticipating an obvious complaint, he had protested against digressions that left the main work to stand still, and had boasted—not without justice in a Shandean sense—that he had reconciled digressive motion with progressive. But in vol. vii. the work is allowed to stand still while the writer is being transported from Shandy Hall to Languedoc. The only progress we make is in the illustration of the buoyant and joyous temper of Tristram himself, who, after all, is a member of the Shandy family, and was due a volume for the elucidation of his character. Vol. viii. begins the long-promised story of Uncle Toby's amours with the Widow Wadman. After seeing to the publication of this instalment of *Tristram* and of another set of sermons—more pronouncedly Shandean in their eccentricity—he quitted England again in the summer of 1765, and tavelled in Italy as far as Naples. The ninth and last and shortest volume of *Tristram*, concluding the episode of Toby Shandy's amours, appeared in 1767. This despatched, Sterne turned to a new project, which had probably been suggested by the ease and freedom with which he had moved through the travelling volume in *Tristram*. The *Sentimental Journey through France and Italy* was intended to be a long work: the plan admitted of any length that the author chose, but, after seeing the first two volumes through the press in the early months of 1768, Sterne's strength failed him, and he died in his lodgings at 41 Old Bond Street on the 18th of March, three weeks after the publication. The loneliness of his end has often been commented on; it was probably due to its unexpectedness. He had pulled through so many sharp attacks of his "vile influenza" and other lung disorders that he began to be seriously alarmed only three days before his death.

Sterne's character defies analysis in brief space. It is too subtle and individual to be conveyed in general terms. For comments upon him from points of view more or less diverse the reader may be referred to Thackeray's *Humourists*, Professor Masson's *British Novelists* (1859), and H. D. Traill's sketch in the "English Men of Letters" Series. The fullest biography is Mr Percy Fitzgerald's (1864). But the reader who cares to have an opinion about Sterne should hesitate till he has read and re-read in various moods considerable portions of Sterne's own writing. This writing is so singularly frank and unconventional that its drift is not at once apparent to the literary student. The indefensible indecency and overstrained sentimentality are on the surface; but after a time every repellent defect is forgotten in the enjoyment of the exquisite literary art. In the delineation of character by graphically significant speech and action, introduced at unexpected turns, left with happy audacity to point their own meaning, and pointing it with a force that the dullest cannot but understand, he takes rank with the very greatest masters. In Toby Shandy he has drawn a character universally lovable and admirable; but Walter Shandy is almost greater as an artistic triumph, considering the difficulty of the achievement. Dr Ferriar, in his *Illustrations of Sterne* (published in 1798), pointed out several unacknowledged plagiarisms from Rabelais, Burton and others; but it is only fair to the critic to say that he was fully aware that they were only plagiarisms of material, and do not detract in the slightest from Sterne's reputation as one of the greatest of literary artists.

A revised edition of Mr Percy Fitzgerald's *Life of Sterne*, containing much new information, appeared in 1896. There is also a valuable study of Sterne by M. Paul Stapfer (1870, 2nd ed., 1882); and many fresh particulars as to Sterne's relations with his wife and daughter, and also with the lady known as "Eliza" (Mrs Elizabeth Draper), are collected in Mr Sidney Lee's article in the *Dict. Nat. Biog.* Sterne's original journal to Mrs Draper ("The Bramine's Journal"), after she had gone back to India, and extending from the 13th of April to the 4th of August 1767, is now in the department of MSS., British Museum (addit. MS. 34,527). A convenient edition of Sterne's works, edited by Professor George Saintsbury, was issued in six volumes in 1894. See also Wilbur L. Cross, *The Life and Times of Laurence Sterne* (New York, 1909); and Walter Sichel, *Sterne: a Study* (1910). (W. M.; A. D.)

STERNE, RICHARD (*c.* 1596–1683), English divine, archbishop of York, was born at Mansfield, Nottinghamshire, and was educated at the free-school in that town and at Trinity College, Cambridge. He was elected fellow of Corpus Christi College in 1620; in 1633 he became chaplain to Archbishop Laud and in 1634 master of Jesus College, Cambridge, and rector of Yelverton, Somerset. For his zeal in helping the royalist cause with college plate he suffered imprisonment at the order of parliament and lost his appointments. He attended Laud at his execution, and during the Commonwealth kept a school at Stevenage, Hertfordshire. At the Restoration he was reinstated as master of Jesus College and soon after was made bishop of Carlisle. With George Griffith, bishop of St Asaph, and Brian Walton, bishop of Chester, he was appointed by Convocation to revise the Prayer Book. In 1664 he was raised to the archbishopric of York. He had impoverished Carlisle, and in his new see, according to Burnet (who calls him "a sour ill-tempered man"), "minded chiefly the enriching of his family." For his regard to the duke of York's interests he was suspected of leaning towards Roman Catholicism. He died on the 20th of June 1683. He helped Brian Walton with the *Polyglot Bible* and wrote a book on logic, *Summa logicae* (London, 1685).

He has also been credited with *The Whole Duty of Man*, which must, however, be assigned to the royalist divine Richard Allestree (1619–1681), provost of Eton College, whose original was considerably altered by his literary executor, John Fell (1625–1686), bishop of Oxford.

STESICHORUS (*c.* 640–555 B.C.), Greek lyric poet, a native of Himera in Sicily, or of Mataurus a Locrian colony in the south of Italy. According to Suïdas, his name was originally Tisias, but was changed to Stesichorus ("organizer of choruses"). His future eminence as a poet was foretold when a nightingale perched upon his lips and sang (Pliny, *Nat. Hist.*, x. 43). We are told that he warned his fellow-citizens against Phalaris, whom they had chosen as their general, by relating to them the well-known fable of the horse, which, in its eagerness to punish the stag for intruding upon its pastures, became the slave of man (Aristotle, *Rhetoric*, ii. 20). But his warnings had no effect; he himself was obliged to flee to Catana, where he died and was buried before the gate called after him the Stesichorean. The story that he was struck blind for slandering Helen in a poem and afterwards recovered his sight when, in consequence of a dream, he had composed a palinode or recantation (in which he declared that only Helen's phantom had been carried off to Troy), is told by Plato (*Phaedrus* 243 A.), Pausanias (iii. 19, 13), and others. We possess about thirty fragments of his poems, none of them longer than six lines. They are written in the Doric dialect, with epic licences; the metre is dactylico-trochaic. Brief as they are, they show us what Longinus meant by calling Stesichorus "most like Homer"; they are full of epic grandeur, and have a stately sublimity that reminds us of Pindar. Stesichorus indeed made a new departure by using lyric poetry to celebrate gods and heroes rather than human feelings and passions; this is what Quintilian (*Instit.* x. 1, 62) means by saying that he "sustained the burden of epic poetry with the lyre." Several of his poems sung of the adventures of Heracles; one dealt with the siege of Thebes, another with the sack of Troy.[1] The last is interesting as being the first poem containing that form of the story of Aeneas's flight to which Virgil afterwards gave currency in his *Aeneid*. The popular legends of Sicily also inspired his muse; he was the first to introduce the shepherd Daphnis who came to a miserable end after he had proved faithless to the nymph who loved him. Stesichorus completed the form of the choral ode by adding the epode to the strophe and antistrophe; and "you do not even know Stesichorus's three" passed into a proverbial expression for unpardonable ignorance (unless the words simply mean, "you do not even know three lines, or poems, of Stesichorus"). He was famed in antiquity for the richness and splendour of his imagination and his style, although Quintilian censures his redundancy and Hermogenes remarks on the excessive sweetness that results from his abundant use of epithets.

Fragments in T. Bergk, *Poetae lyrici graeci*, iii.; see also S. Bernage, *De Stesichoro lyrico* (1880); O. Crusius, "Stesichorus und die epodische Composition in der griechischen Lyrik," in *Commentationes Philologicae*, dedicated to O. Ribbeck (1888).

STETHOSCOPE (Gr. στῆθος, chest, and σκοπεῖν, to look, examine), a medical instrument used in auscultation (*q.v.*). The single stethoscope is a straight wooden or metal tube with a flattened bell, the surface of which is usually covered with ivory or bone at the end which is placed against the body of the patient, and a small cup at the other to fit the ear of the observer. In the "binaural" stethoscope, which has the advantage of flexibility, the tube is divided above the bell into two flexible tubes which lead to both ears.

STETTIN, a seaport of Germany, capital of the Prussian province of Pomerania, on the Oder, 17 m. above its entrance into the Stettiner Haff, 30 m. from the Baltic, 84 m. N.E. of Berlin by rail, and at the junction of lines to Stargard-Danzig and Küstrin-Breslau. Pop. (1885), 99,475; (1890), 116,228; (1900)—including the incorporated suburbs—210,680; (1905) 224,078. The main part of the town occupies a hilly site on the left bank of the river, and is connected by four bridges, including a massive railway swing-bridge, with the suburbs of Lastadie ("lading place" from *lastadium*, "burden,") and Silberwiese, on an island formed by the Parnitz and the Dunzig, which here diverge from the Oder to the Dammsche-See. Until 1874 Stettin was closely girdled by very extensive and strong fortifications, which prevented the expansion of the town, but the steady growth of its commerce and manufactures encouraged the foundation of numerous industrial suburbs beyond the

[1] The *tabula Iliaca*, a stucco bas-relief found in the ruins of an ancient temple on the site of the ancient Bovillae and so called because it represents the chief events of the Trojan War, is a sort of commentary upon this (see O. Jahn and A. Michaelis, *Griechische Bilderchroniken*, 1873; and M. F. Paulcke, *De tabula iliaca quaestiones Stesichoreae*, 1897, an exhaustive treatise).

line of defence and these now combine with Stettin to form one industrial and commercial centre. Since the removal of the fortifications their site has been built upon. Apart from its commerce Stettin is comparatively an uninteresting city, although its appearance, owing to its numerous promenades and open spaces, is very pleasant. Among its nine Evangelical churches that of St Peter, founded in 1124 and restored in 1816–1817, has the distinction of being the oldest Christian church in Pomerania. Both this and the church of St James, dating from the 14th century, are remarkable for their size. Three of the Evangelical churches are fine new buildings, and there are also churches belonging to the Roman Catholics and other religious bodies. The old palace, now used as public offices, is a large but unattractive edifice, scarcely justifying the boast of an old writer that it did not yield in magnificence even to the palaces of Italy. Among the modern buildings are the theatre, the barracks, the bourse, a large hospital, the new town-hall, superseding a building of the 13th century, and the new government buildings. Statues of Frederick the Great, of Frederick William III. and of the emperor William I. adorn two of the fine squares, the Königsplatz and the Kaiser Wilhelmsplatz. Other squares are the Paradeplatz, and the Rathausplatz with a beautiful fountain. Two gateways, the Königstor and the Berliner Tor, remains of the old fortifications, are still standing. As a prosperous commerical town Stettin has numerous scientific, educational and benevolent institutions.

Stettin, regarded as the port of Berlin, is one of the principal ship-building centres of Germany and a place of much commercial and industrial activity. The foremost place in its chief industry, ship-building, is taken by the Vulcan yard, situated in the suburb of Bredow, which builds warships for the German navy. The business was begun in 1851 and now employs about 8000 hands, the works extending over 70 acres and the covered workshops over 650,000 sq. ft. In 1897 a floating dock was fitted up capable of holding vessels of 12,000 tons. Locomotives, boilers and machinery of all kinds are made in other great establishments. Other industries are the manufacture of clothing, cement, bricks, motor-cars, soap, paper, beer, sugar, spirits and cycles. Most of the mills and factories are situated in the suburbs, Grabow, Bredow and others. The sea-borne commerce of Stettin is of scarcely less importance than her industry and a larger number of vessels enter and clear here than at any other German port, except Hamburg and Bremerhaven. Swinemünde serves as its outer port. Its principal exports are grain, wood, chemicals, spirits, sugar, herrings and coal, and its imports are iron goods, chemicals, grain, petroleum and coal. A great impulse to its trade was given in 1898 by the opening of a free harbour adjoining the suburb of Lastadie on the east bank of the Oder; this embraces a total area of 150 acres and quays with a length of 14,270 ft. It has two basins, with the necessary accompaniment of cranes, storehouses, &c., and the deepening of the Oder from Stettin to the Haff to 24 ft. was practically completed by 1903. With the view of still further increasing the commercial importance of Stettin, it is proposed to construct a ship canal giving the town direct communication with Berlin. A feature in the mercantile life of Stettin is the large number of insurance companies which have their headquarters in the town.

The forest and river scenery of the neighbourhood of Stettin is picturesque, but the low level and swampy nature of the soil render the climate bleak and unhealthy.

Stettin is said to have existed as a Wendish settlement in the 9th century, but its first authentic appearance in history was in the 12th century, when it was known as Stedyn. From the beginning of the 12th century to 1637 it was the residence of the dukes of Pomerania, one of whom, Duke Barnim I., gave it municipal rights in 1243. Already a leading centre of trade it entered the Hanseatic League in 1360. The Pomeranian dynasty became extinct in 1637, when the country was suffering from the ravages of the Thirty Years' War, and by the settlement of 1648 Stettin, the fortifications of which had been improved by Gustavus Adolphus, was ceded to Sweden. In 1678 it was taken from Sweden by Frederick William, elector of Brandenburg, but it was restored in 1679, only, however, to be ceded to Prussia in 1720 by the peace of Stockholm. It was fortified more strongly by Frederick the Great, but in 1806 it yielded to France without any resistance and was held by the French until 1813. Stettin was the birthplace of the empress Catherine II. of Russia.

See Berghaus, *Geschichte der Stadt Stettin* (Würzen, 1875–1876); W. H. Meyer, *Stettin in alter und neuer Zeit* (Stettin, 1887); T. Schmidt, *Zur Geschichte des Handels und der Schiffahrt Stettins 1786–1846* (Stettin, 1875); and C. F. Meyer, *Stettin zur Schwedenzeit* (Stettin, 1886).

STEUART, SIR JAMES DENHAM, Bart. (1712–1780), English economist, was the only son of Sir James Steuart, solicitor-general for Scotland under Queen Anne and George I., and was born at Edinburgh on the 21st of October 1712. After passing through the university of Edinburgh he was admitted to the Scottish bar at the age of twenty-four. He then spent some years on the Continent, and while in Rome entered into relations with the Pretender. He was in Edinburgh in 1745, and so compromised himself that, after the battle of Culloden, he found it necessary to return to the Continent where he remained until 1763. It was not indeed until 1771 he was fully pardoned for any complicity he may have had in the rebellion. He died at his family seat, Coltness, in Lanarkshire, on the 26th of November 1780. In 1767 was published Steuart's *Inquiry into the Principles of Political Economy*. It was the most complete and systematic survey of the science from the point of view of moderate mercantilism which had appeared in England. But the time for the mercantile doctrines was past. Nine years later the *Wealth of Nations* was given to the world. Adam Smith never quotes or mentions Steuart's book; being acquainted with Steuart, whose conversation he said was better than his book, he probably wished to keep clear of controversy with him. German economists have examined Steuart's treatise more carefully than English writers; and they have recognized its high merits, especially in relation to the theory of value and the subject of population. They have also pointed out that, in the spirit of the best modern research, he has dwelt on the special characters which distinguish the economies proper to different nations and different grades in social progress.

The Works, Political, Metaphysical and Chronological, of the late Sir James Steuart of Coltness, Bart., now first collected, with Anecdotes of the Author, by his Son, General Sir James Denham Steuart, were published in 6 vols. 8vo in 1805. Besides the *Inquiry* they include—*A Dissertation upon the Doctrine and Principles of Money applied to the German Coin* (1758), *Apologie du sentiment de M. le Chevalier Newton sur l'ancienne chronologie des Grecs* (4to, Frankfort-on-the-Main, 1757), *The Principles of Money applied to the Present State of Bengal*, published at the request of the East India Company (4to, 1772), *A Dissertation on the Policy of Grain* (1783), *Plan for Introducing Uniformity in Weights and Measures within the Limits of the British Empire* (1790), *Observations* on Beattie's *Essay on Truth*, *A Dissertation concerning the Motive of Obedience to the Law of God*, and other treatises.

STEUBEN, FREDERICK WILLIAM AUGUSTUS HENRY FERDINAND, Baron von (1730–1794), German soldier, was born at Magdeburg, Prussia, on the 15th of November 1730, the son of William Augustine Steuben (1699–1783), also a soldier. At fourteen he served as a volunteer in a campaign of the Austrian Succession War. He became a lieutenant in 1753, fought in the Seven Years' War, was made adjutant-general of the free corps in 1754 but re-entered the regular army in 1761, and became an aide to Frederick the Great in 1762. Leaving the army after the war, he was made canon of the cathedral of Havelberg, and subsequently was grand-marshal to the prince of Hohenzollern-Hechingen. In 1777 his friend, the count St Germain, then the French minister of war, persuaded him to go to the assistance of the American colonists, who needed discipline and instruction in military tactics. Steuben arrived at Portsmouth, New Hampshire, on the 1st of December 1777, and offered his services to Congress as a volunteer. In March 1778 he began drilling the inexperienced soldiers at Valley Forge; and by May, when he was made inspector-general, with the rank of major-general, he had established a thorough system of discipline and economy.

Results of his work were shown in the next campaign, particularly at Monmouth, where he rallied the disordered, retreating troops of General Charles Lee. His *Regulations for the Order and Discipline of the Troops of the United States* (1779) was of great value to the army. He was a member of the court-martial which tried Major John André in 1780, and after General Horatio Gates's defeat at Camden was placed in command of the district of Virginia, with special instructions "to collect, organize, discipline and expedite the recruits for the Southern army." In April 1781 he was superseded in command of Virginia by La Fayette and later took part in the siege of Yorktown. Retiring from the service after the war, he passed the last years of his life at Steubenville, New York, where he died on the 28th of November 1794. New York, Virginia, Pennsylvania and New Jersey gave him grants of land for his services, and Congress passed a vote of thanks and gave him a gold-hilted sword in 1784 and later granted him a pension of $2400.

See Frederick Kapp, *The Life of Frederick William von Steuben* (New York, 1859); and George W. Greene, *The German Element in the War of American Independence* (Cambridge, Massachusetts, 1876).

STEUBENVILLE, a city and the county-seat of Jefferson county, Ohio, U.S.A., on the west bank of the Ohio river, about 40 m. W. of Pittsburg. Pop. (1880), 12,093; (1890), 13,394; (1900), 14,349, of whom 1815 were foreign-born and 736 were negroes; (1910 U.S. census) 22,391. It is served by the Wheeling & Lake Erie (Wabash system), the Pittsburg, Cincinnati, Chicago & St Louis (Pennsylvania system), and the Pennsylvania railways, and by inter-urban electric railways. A suspension bridge crosses the Ohio river here. Steubenville is on a high plain (the second terrace of the river), surrounded by hills 300–500 ft. high, in a good farming country, rich in bituminous coal, natural gas, building-stone, petroleum and clay. The city has a Carnegie library, Gill hospital, a Y.M.C.A. building and Stanton and Altamont parks. The value of its factory products increased from $4,547,049 in 1900 to $12,369,677 in 1905, or 172 %—the greatest increase during this period for any city, with a population of 8000 or over in 1900, in the state; during the same period the capital invested in manufacturing industries increased from $2,302,563 to $12,627,048 or 448·4 %. Among manufactures are iron and steel, tin and terne plate, glass, paper and wood pulp, and pottery. Near the city limits are building-stone quarries and coal-mines. The municipality owns and operates the waterworks. Steubenville was platted as a town in 1797, immediately after the erection of Jefferson county, and was built on the site of Fort Steuben, erected in 1786–1787, and named in honour of Baron Frederick William von Steuben; it received a city charter in 1851, and its city limits were much enlarged in 1871.

See W. H. Hunter, "The Pathfinders of Jefferson County," and "The Centennial of Jefferson County," in *Ohio Archaeological and Historical Review*, vol. vi. Nos. 2, 3 (Columbus, 1898).

STEUCO [in Latin Steuchus or Eugubinus], **AGOSTINO** (1496–1549), Italian scholar and divine, was born at Gubbio in Umbria. In 1513 he entered the congregation of the canons of St Saviour, and for some years earned his living by teaching Oriental languages, theology and antiquities. In 1525 he became librarian of the convent of Sant' Antonio at Venice, returning later to Gubbio as prior of his congregation. In 1538 he was made bishop of Chisamo in Crete, but returned after a year or two to Rome, where in 1542 he succeeded Alessandro as prefect of the Vatican Library. He wrote many works on sacred antiquities and Bible exegesis.

See Hoefer, *Nouvelle biographie générale* (Paris, 1857–1870).

STEVEDORE, a person who is engaged in the stowage of cargo on board a ship, one who loads and unloads vessels in port. The word is an adaptation of the Spanish *estivador*, literally a packer, *estivar*, to press or pack closely, Latin *stipare*, to press. The Spanish word was particularly applied to the packers of wool, when Spain was a great wool-exporting country, and thus came into general mercantile use

STEVENAGE, an urban district in the Hitchin parliamentary division of Hertfordshire, England, 28½ m N. of London by the Great Northern railway. Pop. (1901), 3957. The church of St Nicholas, with a graceful tower and spire, is mainly Early English, but has Norman and later portions. There is a grammar school, founded in 1558. By the North Road, south of the town, is a row of six large barrows, considered to be of Danish construction.

STEVENS, ALFRED (1818–1875), British sculptor, was born at Blandford in Dorset on the 28th of January 1818. He was the son of a house painter, and in the early part of his career he painted pictures in his leisure hours. In 1833, through the kindness of the rector of his parish, he was enabled to go to Italy, where he spent nine years in study at Naples, Rome, Florence, Milan and Venice. He had never been at an English school. In 1841 Thorwaldsen employed him for a year in Rome. After this he left Italy for England, and in 1845 he obtained a tutorial position in the School of Design, London. This post he occupied until 1847. In 1850 he became chief artist to a Sheffield firm of workers in bronze and metal. In 1852 he returned to London. To this period belongs his design for the vases on the railings in front of the British Museum, and also the lions on the dwarf posts which were subsequently transferred to the inside of the museum. In 1856 occurred the competition for the Wellington monument, originally intended to be set up under one of the great arches of St Paul's Cathedral, though it was only consigned to that position in 1892. Stevens agreed to carry out the monument for £20,000—a quite inadequate sum, as it afterwards turned out. The greater part of his life as a sculptor Stevens devoted to this grand monument, constantly harassed and finally worn out by the interference of government, want of money and other difficulties. Stevens did not live to see the monument set up—perhaps fortunately for him, as it was for many years placed in a small side chapel, where the effect of the whole was utterly destroyed and its magnificent bronze groups hidden from view. Stevens was aware of the position finally decided on for the work, and he suppressed the equestrian group intended for the summit and left the model for the latter feature in a rough state. On the removal of the monument from the chapel to the intercolumnar space on the north side of the nave for which it was originally designed, the model of horse and man was placed in the hands of an able young sculptor, trained mainly in another school, to be worked upon and cast in bronze. The incongruity of the idea did not strike those responsible for the proceeding. Its completion was still not carried into effect in 1910, after years of work and polemics, and it was feared that it would have a disastrous result on the masterpiece as a whole. Indeed the president of the Royal Institute of British Architects declared that the structure would not bear the weight of the addition. The monument itself consists of a sarcophagus supporting a recumbent bronze effigy of the duke, over which is an arched marble canopy of late Renaissance style on delicately enriched shafts. At each end of the upper part of the canopy is a large bronze group, one representing Truth tearing the tongue out of the mouth of Falsehood, and the other Valour trampling Cowardice underfoot. The two virtues are represented by very stately female figures modelled with wonderful beauty and vigour; the vices are two nude male figures treated in a very massive way. The vigorous strength of these groups recalls the style of Michelangelo, but Stevens's work throughout is original and has a very distinct character of its own. Owing to the many years he spent on this one work Stevens did not produce much other sculpture. In Dorchester House, Park Lane, there is some of his work, especially a very noble mantelpiece supported by nude female caryatids in a crouching attitude, modelled with great largeness of style. He also designed mosaics to fill the spandrels under the dome of St Paul's. Stevens died in London on the 1st of May 1875.

See Sculpture: *British*; Sir William Armstrong, *Alfred Stevens* (London, 1881); H. Stannus, *Alfred Stevens* (London, 1891).

STEVENS, ALFRED (1828–1906), Belgian painter, was born in Brussels on the 11th of May 1828. His father, an old officer in the service of William I., king of the Netherlands, was passionately fond of pictures, and readily allowed his son to draw in the studio of François Navez, director of the Brussels Academy. In 1844 Stevens went to Paris and worked under the instruction of Camille Roqueplan, a friend of his father's; he also attended the classes at the École des Beaux Arts, where Ingres was then professor. In 1849 he painted at Brussels his first picture, "A Soldier in Trouble," and in the same year went back to Paris, where he definitely settled, and exhibited in the Salons. He then painted "Ash-Wednesday Morning," "Burghers and Country People finding at Daybreak the Body of a Murdered Gentleman," "An Artist in Despair," and "The Love of Gold." In 1855 he exhibited at the Antwerp Salon a little picture called "At Home," which showed the painter's bent towards depicting ladies of fashion. At the Great Exhibition in Paris, 1855, his contributions were remarkable, but in 1857 he returned to graceful female subjects, and his path thenceforth was clear before him. At the Great Exhibition of 1867 he was seen in a brilliant variety of works in the manner he had made his own, sending eighteen exquisite paintings; among them were the "Lady in Pink" (in the Brussels Gallery), "Consolation," "Every Good Fortune," "Miss Fauvette," "Ophelia," and "India in Paris." At the Paris International Exhibitions of 1878 and 1889, and at the Historical Exhibition of Belgian Art, Brussels, 1880, he exhibited "The Four Seasons" (in the Palace at Brussels), "The Parisian Sphinx," "The Japanese Mask," "The Japanese Robe," and "The Lady-bird" (Brussels Gallery). He died on the 24th of August 1906. "Alfred Stevens is one of the race of great painters," wrote Camille Lemonnier, "and like them he takes immense pains with the execution of his work." The example of his finished technique was salutary, not merely to his brethren in Belgium, but to many foreign painters who received encouragement from the study of his method. The brother of Alfred Stevens, Joseph Stevens, was a great painter of dogs and dog life.

See J. du Jardin, *L'Art flamand*; Camille Lemonnier, *Histoire des beaux arts en Belgique*.

STEVENS, HENRY (1819–1886), American bibliographer, was born in Barnet, Vermont, on the 24th of August 1819. He studied at Middlebury College, Vermont, in 1838–1839, graduated at Yale in 1843 and studied at the Cambridge (Massachusetts) Law School in 1843–1844. In 1845 he went to London, where he was employed during most of the remainder of his life as a collector of Americana for the British Museum and for various public and private American libraries. He was engaged by Sir Anthony Panizzi, librarian of the British Museum, to collect historical books, documents, journals, &c., concerning North and South America; and he was purchasing agent for the Smithsonian Institution and for the library of Congress, as well as for James Lenox, of New York, for whom he secured much of the valuable Americana in the Lenox library in that city, and for the John Carter Brown library, at Providence, Rhode Island. He became a member of the Society of Antiquaries in 1852, and in 1877 was a member of the committee which organized the Caxton Exhibition, for which he catalogued the collection of Bibles. He died at South Hampstead, England, on the 28th of February 1886.

His principal compilations and publications were: an *Analytical Index to the Colonial Documents of New Jersey in the State Paper Office in England* (1858), constituting vol. v. of the New Jersey Historical Society's *Collections*; *Collection of Historical Papers relating to Rhode Island . . . 1640–1775* (6 vols.), for the John Carter Brown library; historical indexes of the colonial documents relating to Maryland (10 vols.), now in the library of the Maryland Historical Society; and a collection of papers relating to Virginia for the period 1585–1775, incomplete, deposited in the Virginia state library in 1858; a valuable *Catalogue of American Maps in the Library of the British Museum* (1856); catalogues of American, of Mexican and other Spanish-American and of Canadian and other British North American books in the library of the British Museum; *Historical and Geographical Notes on the Earliest Discoveries in America, 1453–1530, with Comments on the Earliest Maps and Charts, &c.* (1869), *Sebastian Cabot – John Cabot = 0* (1870); *The Bibles in the Caxton Exhibition, 1877* (1878); and *Recollections of Mr James Lenox, of New York, and the Formation of his Library* (1886).

His brother, Benjamin Franklin Stevens (1833–1902), also a bibliographer, was born at Barnet, Vermont, on the 19th of February 1833, was educated at the university of Vermont, and in 1860 became associated with his brother in London. For about thirty years he was engaged in preparing a chronological list and alphabetical index of American state papers in English, French, Dutch and Spanish archives, covering the period from 1763 to 1784, and he prepared more than 2000 facsimiles of important American historical manuscripts found in European archives and relating to the period between 1773 and 1783. He also acted as purchasing agent for various American libraries, and for about thirty years before his death was United States despatch agent at London and had charge of the mail intended for the vessels of the United States navy serving in Atlantic or European stations. He died at Surbiton, Surrey, England, on the 5th of March 1902.

His principal publications include *Campaign in Virginia, 1781: an Exact Reprint of Six Rare Pamphlets on the Clinton-Cornwallis Controversy, with . . . Manuscript Notes by Sir Henry Clinton; with a Supplement containing Extracts from the Journals of the House of Lords* (1888); *Facsimiles of Manuscripts in European Archives Relating to America, 1773–1783, with Descriptions, References and Translations* (25 vols., 1889–1898); *General Sir William Howe's Orderly Book at Charlestown, Boston and Halifax* (1890); and *Columbus: His Own Book of Privileges, 1502* (1893).

STEVENS, THADDEUS (1792–1868), American political leader, was born in Danville, Vermont, on the 4th of April 1792. He graduated at Dartmouth College in 1814, removed to York, Pennsylvania, was admitted to the bar (in Maryland), and for fifteen years practised at Gettysburg, Pennsylvania. He was a leader of the Anti-Masons in Pennsylvania, and was prominent in the national Anti-Masonic Convention at Baltimore in 1831. He served in the Pennsylvania House of Representatives, first as an Anti-Mason and later as a Whig, in 1833–1835, 1838–1839 and 1841–1842. On the 11th of April 1835 he made an eloquent speech in defence of free public education. A partner's venture in the iron business having involved him in a debt of $217,000, he retired from public life in 1842 and practised law in Lancaster, Pennsylvania, with such success as within six years to reduce this debt to $30,000. He frequently appeared in behalf of fugitive slaves before the Pennsylvania courts, and previously, in the state constitutional convention of 1837, he had refused to sign the constitution limiting the suffrage to white freemen. In 1840 he did much in Pennsylvania to bring about the election of W. H. Harrison, and in the campaign of 1844 Stevens again rendered marked services to the Whig ticket. He was a Whig representative in Congress in 1849–1853, and was leader of the radical Whigs and Free-Soilers, strongly opposing the Compromise Measures of 1850, and being especially bitter in his denunciations of the Fugitive Slave Law. In 1855 he took a prominent part in organizing the Republican party in Pennsylvania, and in 1856 was a delegate to the Republican National Convention, in which he opposed the nomination of John C. Frémont. He returned to the National House of Representatives in 1859 and bitterly criticized the vacillation of Buchanan's administration. He became chairman of the ways and means committee on the 4th of July 1861, and until his death was, as James G. Blaine said, "the natural leader who assumed his place by common consent." During the Civil War he was instrumental in having necessary revenue measures passed in behalf of the administration. He was not, however, in perfect harmony with Lincoln, who was far more conservative as well as broader minded and more magnanimous than he; besides this Stevens felt it an injustice that Lincoln in choosing a member of his cabinet from Pennsylvania had preferred Cameron to himself. During the war Stevens urged emancipation of the slave, and earnestly advocated the raising of negro regiments. He not only opposed the president's "ten per cent. plan" in Louisiana and Arkansas (*i.e.* the plan which provided that these states might be reorganized by as many as 10% of the number of voters in 1860 who should ask for pardon and take the oath of allegiance to the United States), but he also refused to accept the Wade-Davis Bill as being far too moderate in character. On the motion of Stevens (Dec. 4, 1865), the two houses appointed a joint committee on reconstruction, and Stevens was made chairman of the House committee. In his speech of the 18th of December 1865 he asserted that rebellion had *ipso facto* blotted out of being all states in the South, that that section was then a "conquered province," and that its government was in the hands of Congress, which could do with it as it wished. He introduced from the joint committee what became, with changed clause as to the basis of representation, the Fourteenth Amendment, and also the Reconstruction Act of the 6th of February 1867. He also advocated the Freedmen's Bureau bills and the Tenure of Office Act, and went beyond Congress in favouring the confiscation of the property of the Confederate States and "of the real estate of 70,000 rebels who own above 200 acres each, together with the lands of their several states," for the benefit of the freedmen and loyal whites and to reimburse, it was said, the sufferers from Lee's invasion of Pennsylvania, during which Stevens's own ironworks at Chambersburg had been destroyed. He led Congress in the struggle with the president, and after the president's removal of Secretary of War Stanton he reported the impeachment resolution to the house and was chairman of the committee appointed to draft the articles of impeachment. He was one of the managers appointed to conduct the case for the House of Representatives before the Senate, but owing to ill-health he took little part in the trial itself. He died at Washington, D.C., on the 11th of August 1868, and was buried at Lancaster, Pennsylvania.[1]

Stevens was an extreme partisan in politics; and his opponents and critics have always charged him with being vindictive and revengeful toward the South. Instead of obtaining political and social equality for the negro, his policy intensified racial antagonism, forced practically all of the white people of the South into the Democratic party, and increased the difficulties in the way of a solution of the race problem; the policy, however, was the result of the passions and political exigencies of the time, and Stevens cannot be held responsible except as the leader of the dominant faction in Congress. He was an able, terse, forcible speaker, master of bitter sarcasm, irony, stinging ridicule, and, less often used, good-humoured wit.

See S. W. McCall's *Thaddeus Stevens* (Boston and New York, 1899), in the American Statesmen Series, a sympathetic, but judicious biography; also J. F. Rhodes, *History of the United States from the Compromise of 1850*, especially vol. v. (New York, 1904).

STEVENSON, ADLAI EWING (1835–), American political leader, was born in Christian county, Kentucky, on the 23rd of October 1835. He removed with his family to Bloomington, Illinois, in 1852; was educated at the Illinois Wesleyan University at Bloomington and at Centre College, Danville, Kentucky; and was admitted to the Illinois bar in 1857. He was master in chancery for Woodford county, Illinois, in 1860–1864, and district-attorney for the twenty-third judicial district of that state from 1865 to 1869, when he removed to Bloomington. He was a Democratic representative in Congress from Illinois in 1875–1877 and again in 1879–1881; was first assistant postmaster-general in 1885–1889, and was severely criticized for his wholesale removal of Republican postmasters. He was a delegate to the national Democratic conventions in 1884 and 1892, and in the latter year was elected vice-president of the United States on the ticket with Cleveland, serving from 1893 to 1897. In 1897 he was a member of the commission (Senator Edward O. Wolcott and General Charles J. Paine being the other members) appointed by President McKinley to confer with the governments of Great Britain, France and Germany with a view to the establishment of international bimetallism. He was again Democratic nominee for vice-president in 1900, but was defeated. He published *Something of Men I have Known; With Some Papers of a General Nature, Political, Historical and Retrospective* (1909).

[1] In accordance with his own wish he was buried in a small graveyard rather than in one of the regular city cemeteries, and on his tombstone is the following epitaph written by himself: "I repose in this quiet and secluded spot, not from any natural preference for solitude, but, finding other cemeteries limited as to race by charter rules, I have chosen this, that I might illustrate in my death the principles I advocated through a long life—Equality of man before his Creator." He bequeathed a part of his estate to found a home for white and negro orphans—the present Thaddeus Stevens industrial school—at Lancaster.

STEVENSON, ROBERT (1772–1850), Scottish engineer, was the only son of Alan Stevenson, partner in a West Indian house in Glasgow, and was born in that city on the 8th of June 1772. He was educated at Anderson's College, Glasgow, and Edinburgh University. In his youth he assisted his stepfather, Thomas Smith, in his lighthouse schemes, and at the age of nineteen was sent to superintend the erection of a lighthouse on the island of Little Cumbrae. Subsequently he succeeded Smith, whose daughter he married in 1799, as engineer to the Commissioners of Northern Lighthouses, and during his period of office, from 1797 to 1843, he designed and executed a large number of lighthouses, the most important being that on the Bell Rock, begun in 1807. For its illumination he introduced an improved apparatus, and he was also the author of various valuable inventions in connexion with lighting, including the intermittent and flashing lights, and the mast lantern for lightships. As a civil engineer he improved the approaches to Edinburgh, including that by the Calton Hill, constructed harbours, docks and breakwaters, improved river and canal navigation, and constructed several important bridges. In consequence of observations made by him George Stephenson advocated the use of malleable- instead of cast-iron rails for railways, and he was the inventor of the movable jib and balance cranes. Chiefly through his interposition an admiralty survey was established, from which the admiralty sailing directions for the coasts of Great Britain and Ireland have been prepared. Stevenson published an *Account of the Bell Rock Lighthouse* in 1824, and, besides contributing important articles on engineering subjects to Brewster's *Edinburgh Encyclopaedia* and the *Encyclopaedia Britannica*, was the author of various papers read before learned societies. He died at Edinburgh on the 12th of July 1850.

Of his family, three sons, Alan, David and Thomas, attained distinction as lighthouse engineers. The eldest, Alan (1807–1865), eventually became a partner with his father, whom he succeeded as engineer to the Commissioners of Northern Lighthouses in 1843. The most noteworthy lighthouse designed by him is Skerryvore on the west coast of Scotland, an isolated tower of which the first stone was laid in 1840 and which first showed its light in 1843. He published an *Account of the Skerryvore Lighthouse* in 1848, and a *Rudimentary Treatise on the History, Construction and Illumination of Lighthouses* in 1850, and he wrote the article on lighthouses in the 8th edition of the *Encyclopaedia Britannica*. The third son, David (1815–1886), was at first engaged on land and marine surveys and in railway work. In 1837 he made a tour in North America, which gave rise to his *Sketch of the Civil Engineering of North America* (1838), and on his return became a partner in his father's business. In 1853 he and his youngest brother Thomas were appointed joint engineers to the Commissioners of Northern Lighthouses in succession to their brother Alan, and he designed many lighthouses not only in Scotland but also in New Zealand, India and Japan. His books include *Marine Surveying* (1842), *Canal and River Engineering* (1858), *Reclamation and Protection of Agricultural Land* (1874), and *Life of Robert Stevenson* (1878), and he was also a contributor to the 8th and 9th editions of the *Encyclopaedia Britannica*. The youngest son, Thomas (1818–1887), joined his father's business in 1846, and as joint engineer to the Commissioners of Northern Lighthouses from 1853 to 1885 introduced various improvements in lighthouse illumination, which were described in the article on lighthouses he wrote for the 9th edition of the *Encyclopaedia Britannica*. He was also deeply interested in meteorology, and in 1864 designed the Stevenson screen widely used for the sheltering of thermometers. He was the father of Robert Louis Stevenson.

STEVENSON, ROBERT LEWIS BALFOUR (1850–1894), British essayist, novelist and poet, was the only child of Thomas Stevenson, civil engineer, and his wife, Margaret Isabella Balfour. He was born at 8 Howard Place, Edinburgh, on the 13th of

November 1850. He suffered from infancy from great fragility of health, and nearly died in 1858 of gastric fever, which left much constitutional weakness behind it. From the age of six he showed a disposition to write. He went to school, mainly in Edinburgh, from 1858 to 1867, but his ill-health prevented his learning much, and his teachers, as his mother afterwards said, "liked talking to him better than teaching him." He often accompanied his father on his official visits to the lighthouses of the Scottish coast and on longer journeys, thus early accustoming himself to travel. As his health improved it was hoped that he would be able to adopt the family profession of civil engineering, and in 1868 he went to Anstruther and then to Wick as a pupil engineer. In 1871 he had so far advanced as to receive the silver medal of the Edinburgh Society of Arts for a paper suggesting improvements in lighthouse apparatus. But long before this he had started as an author. His earliest publication, the anonymous pamphlet of *The Pentland Rising*, had appeared in 1866, and *The Charity Bazaar*, a trifle in which his future manner is happily displayed, in 1868. From about the age of eighteen he dropped his baptismal names of Lewis Balfour and called himself Robert Louis, but was mostly known to his relatives and intimate friends as "Louis." Although he greatly enjoyed the outdoor business of the engineer's life it strained his physical endurance too much, and in 1871 was reluctantly exchanged for study at the Edinburgh bar, to which he was called in 1875. In 1873 he first met Mr Sidney Colvin, who was to prove the closest of his friends and at last the loyal and admirable editor of his works and his correspondence; and to this time are attributed several of the most valuable friendships of Stevenson's life.

He was now labouring, with extreme assiduity, to ground himself in the forms and habits of literary style. In 1875 appeared, anonymously, his *Appeal to the Clergy of the Church of Scotland*, and in that year he made the first of many visits to the forest of Fontainebleau. Meanwhile at Mentone in the winter of 1873–1874 he had grown in mind under the shadow of extreme physical weakness, and in the following spring began to contribute essays of high originality to one or two periodicals, of which the *Cornhill*, then edited by Sir Leslie Stephen, was at first the most important. Stevenson made no attempt to practice at the bar, and the next years were spent in wanderings in France, Germany and Scotland. Records of these journeys, and of the innocent adventures which they encouraged, were given to the world as *An Inland Voyage* in 1878, and as *Travels with a Donkey in the Cevennes* in 1879. During these four years Stevenson's health, which was always bettered by life out of doors, gave him little trouble. It was now recognized that he was to be an author, and he contributed many essays, tales and fantasies to various journals and magazines. At Fontainebleau in 1876 Stevenson had met Mrs Osbourne, the lady who afterwards became his wife; she returned to her home in California in 1878, and in August of the following year, alarmed at news of her health, Stevenson hurriedly crossed the Atlantic. He travelled, from lack of means, as a steerage passenger and then as an emigrant, and in December, after hardships which seriously affected his health, he arrived in San Francisco. In May 1880 he married, and moved to the desolate mining-camp which he has described in *The Silverado Squatters*. As Mr Colvin has well said, these months in the west of America were spent "under a heavy combined strain of personal anxiety and literary effort." Some of his most poignant and most enchanting letters were written during this romantic period of his life. In the autumn of 1880 he returned to Scotland, with his wife and stepson, who were received at once into the Edinburgh household of his parents. But the condition of his health continued to be very alarming, and they went almost immediately to Davos, where he remained until the spring of 1881. In this year was published *Virginibus puerisque*, the earliest collection of Stevenson's essays. He spent the summer months in Scotland, writing articles, poems, and above all his first romance, *The Sea-Cook*, afterwards known as *Treasure Island*; but he was driven back to Davos in October. In 1882 appeared *Familiar Studies of Men and Books* and *New Arabian Nights*. His two winters at Davos had done him some good, but his summers in Scotland invariably undid the benefit. He therefore determined to reside wholly in the south of Europe, and in the autumn of 1882 he settled near Marseilles. This did not suit him, but from March 1883 to July 1884 he was at home at a charming house called La Solitude, above Hyères; this was in many ways to be the happiest station in the painful and hurrying pilgrimage of Stevenson's life. *The Silverado Squatters* was published in 1883, and also the more important *Treasure Island*, which made Stevenson for the first time a popular writer. He planned a vast amount of work, but his schemes were all frustrated in January 1884 by the most serious illness from which he had yet suffered. He was just pulled through, but the attack was followed by long prostration and incapacity for work, and by continued relapses. In July he was brought back to England, and from this time until August 1887 Stevenson's home was at Bournemouth. In 1885 he published, after long indecision, his volume of poems, *A Child's Garden of Verses*, an inferior story, *The Body Snatcher*, and that admirable romance, *Prince Otto*, in which the peculiar quality of Stevenson's style was displayed at its highest. He also collaborated with W. E. Henley in some plays, *Beau Austin*, *Admiral Guinea* and *Robert Macaire*. Early in 1886 he struck the public taste with precision in his wild symbolic tale of *The Strange Case of Dr Jekyll and Mr Hyde*. In the summer of the same year he published *Kidnapped*, which had been written at Bournemouth.

This, however, was a period of great physical prostration, so that 1886 and 1887 were perforce among the least productive years of Stevenson's life. In the early months of 1887 Stevenson was particularly ill, and he was further prostrated by being summoned in May to the deathbed of his father, who had just returned to Edinburgh from the south. He printed privately as a pamphlet, in June 1887, a brief and touching sketch of his father. In July he published his volume of lyrical poems called *Underwoods*. The ties which bound him to England were now severed, and his health was broken to such a discouraging degree that he determined to remove to another hemisphere. Accordingly, having disposed of Skerryvore, his house at Bournemouth, he sailed from London, with his wife, mother and stepson, for New York on the 17th of August 1887. He never set foot in Europe again. His memoir of his friend Professor Fleeming Jenkin was published soon after his departure. After resting at Newport, he went for the winter to be under the care of a physician at Saranac Lake in the Adirondacks for the winter. Here he was very quiet, and steadily active with his pen, writing both the greater part of the *Master of Ballantrae* and many of his finest later essays. He had undertaken, for a regular payment greatly in excess of anything which he had hitherto received, to contribute a monthly essay to *Scribner's Magazine*, and these essays, twelve in number, were published continuously throughout the year 1888. Early in that year was begun *The Wrong Box*, a farcical romance in which Mr Lloyd Osbourne participated; Stevenson also began a romance about the Indian Mutiny, which he abandoned. His attitude about this time to life and experience is reflected in *Pulvis et umbra*, one of the noblest of all his essays. In April 1888 he was at the coast of New Jersey for some weeks, and in June started for San Francisco, where he had ordered a schooner, the "Casco," to be ready to receive him. On the 28th of the month, he started, as Mr Colvin has said, "on what was only intended to be a pleasure excursion . . . but turned into a voluntary exile prolonged until the hour of his death": he never again left the waters of the Pacific. The "Casco" proceeded first to the Marquesas, and south and east to Tahiti, passing before Christmas northwards to Honolulu, where Stevenson spent six months and finished *The Master of Ballantrae* and *The Wrong Box*. It was during this time that he paid his famous visit to the leper settlement at Molokai. In 1889, "on a certain bright June day," the Stevensons sailed for the Gilbert Islands, and after six months' cruising found themselves at Samoa, where he landed for the first time about Christmas Day 1889. On this occasion, however, though strongly drawn to the beautiful island, he stayed not longer than six weeks, and proceeded to Sydney, where, early in 1890, he published, in a blaze of righteous anger, his *Father Damien: an Open Letter to the Rev. Dr Hyde of Honolulu*, in vindication of the memory of Father Damien and his work among the lepers of the Pacific. At Sydney he was very ill again: it was now obvious that his only chance of health lay within the tropics. For nearly the whole of the year 1890 the Stevensons were cruising through unfamiliar archipelagos on board a little trading steamer, the "Janet Nicholl." Meanwhile his volume of *Ballads* was published in London.

The last four years of his unquiet life were spent at Samoa, in circumstances of such health and vigour as he had never previously enjoyed, and in surroundings singularly picturesque. It was in November 1890 that he made his abode at Vailima, where he took a small barrack of a wooden box 500 ft. above the sea, and began to build himself a large house close by. The natives gave him the name of Tusitala. His character developed unanticipated strength on the practical side; he became a vigorous employer of labour, an active planter, above all a powerful and benignant island chieftain. He gathered by degrees around him "a kind of feudal clan of servants and retainers," and he plunged, with more generous ardour than coolness of judgment, into the troubled politics of the country. He took up the cause of the deposed king Mataafa with extreme ardour, and he wrote a book, *A Footnote to History: Eight Years of Trouble in Samoa* (1892), in the endeavour to win over British sympathy to his native friends. In the autumn of this year he received a visit at Vailima from the countess of Jersey, in company with whom and some others he wrote the burlesque extravagance in prose and verse, called *An Object of Pity*, privately printed in 1893 at Sydney. Whenever the cultivation of his estate and the vigorous championship of his Samoan retainers gave him the leisure, Stevenson was during these years almost wholly occupied in writing romances of Scottish life. *The Wrecker*, an adventurous tale of American life, which mainly belonged to an earlier time, was written in collaboration with Mr Lloyd Osbourne and finally published in 1892; and towards the close of that very eventful and busy year he began *The Justice Clerk*, afterwards *Weir of Hermiston*. A portion of the old record of emigrant experiences in 1879, long suppressed for private reasons, also appeared in book form in 1892. In 1893 Stevenson published the important Scottish romance of *Catriona*, written as a sequel to *Kidnapped*, and the three tales illustrative of Pacific Ocean character, *Island Nights' Entertainments*. But in 1893 the uniform good fortune which had attended the Stevensons since their settlement in Samoa began to be disturbed. The whole family at Vailima became ill, and the final subjugation of his protégé Mataafa, and the destruction of his party in Samoan politics, deeply distressed and discouraged Stevenson. In a series of letters to *The Times* he exposed the policy of the chief justice, Mr Cedercrantz, and the president of the council, Baron Senfft. He so influenced public opinion that both were removed from office. In the autumn of that year he went for a change of scene to the Sandwich Islands, but was taken ill there, and was only too glad to return to Samoa. In 1894 he was greatly cheered by the plan, suggested by friends in England and carried out by them with the greatest energy, of the noble collection of his works in twenty-eight volumes, since known as the Edinburgh editions. In September 1894 was published *The Ebb Tide*, the latest of his books which he saw through the press. Of Stevenson's daily avocations, and of the temper of his mind through these years of romantic exile, a clear idea may be obtained by the posthumous *Vailima Letters*, edited by Mr Sidney Colvin in 1895. Through 1894 he was engaged in composing two romances, neither of which he lived to complete. He was dictating *Weir of Hermiston*, apparently in his usual health, on the day he died. This was the 3rd of December 1894; he was gaily talking on the verandah of his house at Vailima when he had a stroke of apoplexy, from which he never recovered consciousness, and passed away painlessly in the course of the evening. His body was carried next day by sixty sturdy Samoans, who acknowledged Stevenson as their chief, to the summit of the precipitous peak of Vaea, where he had wished to be buried, and where they left him to rest for ever with the Pacific Ocean at his feet.

The charm of the personal character of Stevenson and the romantic vicissitudes of his life are so predominant in the minds of all who knew him, or lived within earshot of his legend, that they made the ultimate position which he will take in the history of English literature somewhat difficult to decide. That he was the most attractive figure of a man of letters in his generation is admitted; and the acknowledged fascination of his character was deepened, and was extended over an extremely wide circle of readers, by the publication in 1899 of his *Letters*, which have subdued even those who were rebellious to the entertainment of his books. It is therefore from the point of view of its "charm" that the genius of Stevenson must be approached, and in this respect there was between himself and his books, his manners and his style, his practice and his theory, a very unusual harmony. Very few authors of so high a class have been so consistent, or have made their conduct so close a reflection of their philosophy. This unity of the man in his work makes it difficult, for one who knew him, to be sure that one rightly gauges the purely literary significance of the latter. There are some living who still hear in every page of Stevenson the voice of the man himself, and see in every turn of his language his flashing smile. So far, however, as it is possible to disengage one's self from this captivation, it may be said that the mingling of distinct and original vision with a singularly conscientious handling of the English language, in the sincere and wholesome self-consciousness of the strenuous artist, seems to be the central feature of Stevenson as a writer by profession. He was always assiduously graceful, always desiring to present his idea, his image, his rhapsody, in as persuasive a light as possible, and, particularly, with as much harmony as possible. He had mastered his manner and, as one may say, learned his trade, in the exercise of criticism and the reflective parts of literature, before he surrendered himself to that powerful creative impulse which had long been tempting him, so that when, in mature life, he essayed the portraiture of invented character he came to it unhampered by any imperfection of language. This distinguished mastery of style, and love of it for its own sake within the bounds of good sense and literary decorum, gave him a pre-eminence among the story-tellers of his time. No doubt it is still by his romances that Stevenson keeps the wider circle of his readers. But many hold that his letters and essays are finer contributions to pure literature, and that on these exquisite mixtures of wisdom, pathos, melody and humour his fame is likely to be ultimately based. In verse he had a touch far less sure than in prose. Here we find less evidence of sedulous workmanship, yet not infrequently a piercing sweetness, a depth of emotion, a sincere and spontaneous lovableness, which are irresistibly touching and inspiring.

The personal appearance of Stevenson has often been described: he was tall, extremely thin, dark-haired, restless, compelling attention with the lustre of his wonderful brown eyes. In the existing portraits of him those who never saw him are apt to discover a strangeness which seems to them sinister or even affected. This is a consequence of the false stability of portraiture, since in life the unceasing movement of light in the eyes, the mobility of the mouth, and the sympathy and sweetness which radiated from all the features, precluded the faintest notion of want of sincerity. Whatever may be the ultimate order of reputation among his various books, or whatever posterity may ultimately see fit to ordain as regards the popularity of any of them, it is difficult to believe that the time will ever come in which Stevenson will not be remembered as the most beloved of the writers of that age which he did so much to cheer and stimulate by his example.

His cousin R. A. M. Stevenson (1847–1900) was an accomplished art-critic, who in 1889 became professor of fine arts at University College, Liverpool; he published several works on art (*Rubens*, 1898; *Velasquez*, 1895; *Raeburn*, 1900).

R. L. Stevenson's other works include: *Memories and Portraits* (1887); *The Merry Men and other Tales and Fables* (1887); *The Black Arrow* (1888); *Edinburgh: Picturesque Notes* (1889); *Across the Plains, with other Memories and Essays* (1892), and the posthumous works, *Songs of Travel and other Verses* (1896), *St Ives* (1899), completed by Sir A. T. Quilier Couch; *A Stevenson Medley* (1899); *In the South Seas: experiences . . . on the "Casco" (1888) and the Equator (1889)* (1900). See the *Letters of Stevenson to his Family* (1899), with the critical and biographical preface by Mr Sidney Colvin; *Vailima Letters, to Sidney Colvin* (1895), and the *Life of Robert Louis Stevenson* by Graham Balfour (1901). See also Professor Walter Raleigh, *R. L. Stevenson* (1895), and *Memories of Vailima* (1903), by Isobel Strong and Lloyd Osbourne. A complete edition of Stevenson's works was issued at Edinburgh in 1894–1898. A *Bibliography* of the works of R. L. Stevenson by Colonel W. F. Prideaux appeared in 1903. (E. G.)

STEVENS POINT, a city and the county-seat of Portage county, Wisconsin, U.S.A., on both banks of the Wisconsin river, about 110 m. N. of Madison. Pop. (1890), 7896; (1900), 9524, of whom 2205 were foreign-born; (1910 U.S. census), 8692. Stevens Point is served by the Green Bay & Western and the Minneapolis, St Paul & Sault Ste Marie railways. It is attractively situated, has a fine public school system, including a high school, a manual training school, a domestic science department, and kindergarten and day schools for the deaf. It is the seat of one of the state normal schools (1894), of St Joseph's Academy (Polish), and of the Stevens Point Commercial College, and has a Carnegie library (1904), the Portage county court-house, a city hospital, and a tuberculosis sanatorium. The city is situated in the borders of the pine timber region, and the lumber industry predominates. There are railway repair shops here, and various manufactures. The city has a considerable wholesale jobbing trade, and is an important point of shipment for the products of the agricultural country in the vicinity. Stevens Point was first settled by George Stevens in 1839, was incorporated as a village in 1847, and was first chartered as a city in 1858.

STEVENSTON, a manufacturing town of Ayrshire, Scotland. Pop. (1901), 6554. It is situated about 1 m. from Saltcoats on the coast of the Firth of Clyde, 29 m. S.W. of Glasgow by the Glasgow & South-Western railway. There are coal-mines, several ironworks—one is among the largest in Scotland—and, on the sandhills along the shore, the works of Nobel's Explosives Company, which cover an area of a mile, the separate-hut principle being adopted to minimize the risks attendant upon so dangerous an occupation.

STEVINUS, SIMON (1548–1620), Dutch mathematician, was born in 1548 at Bruges (where the Place Simon Stevin contains his statue by Eugen Simonis) and died in 1620 at the Hague or in Leiden. Of the circumstances of his life very little is recorded; the exact day of his birth and the day and place of his death are alike uncertain. It is known that he left a widow with two children; and one or two hints scattered throughout his works inform us that he began life as a merchant's clerk in Antwerp, that he travelled in Poland, Denmark and other parts of northern Europe, and that he was intimate with Prince Maurice of Orange, who asked his advice on many occasions, and made him a public officer—at first director of the so-called "waterstaet," and afterwards quartermaster-general. The question whether Stevinus, like most of the rest of the prince's followers, belonged to the Protestant creed hardly admits of a categorical answer. A Roman Catholic would perhaps not have been so ready as Stevinus to deny the value of all authority. A Roman Catholic could not well have boasted, as Stevinus in a political pamphlet did, that he had always been in harmony with the executive power. But against these considerations it might be urged that a Protestant had no occasion to boast of a harmony most natural to him, while his further remark to the effect that a state church is indispensable, and that those who cannot belong to it on conscientious grounds ought to leave the country rather than show any opposition to its rites, seems rather to indicate the crypto-Catholic. The same conclusion is supported by the fact that Stevinus, a year before his death, bequeathed a pious legacy to the church of Westkerke in Flanders out of the revenues of which masses were to be said.

His claims to fame are varied. His contemporaries were most struck by his invention of a carriage with sails, a little model of which was preserved at Scheveningen till 1802. The carriage itself had been lost long before; but we know that about the year 1600 Stevinus, with Prince Maurice of Orange and twenty-six others, made use of it on the seashore between Scheveningen and Petten, that it was propelled solely by the force of the wind, and that it acquired a speed which exceeded that of horses. Another idea of Stevinus, for which even Hugo Grotius gave him great credit, was his notion of a bygone age of wisdom. The goal to be aimed at is the bringing about of a second age of wisdom, in which mankind shall have recovered all its early knowledge. The fellow-countrymen of Stevinus were proud that he wrote in their own dialect, which he thought fitted for a universal language, as no other abounded like Dutch in monosyllabic radical words.

Stevinus was the first to show how to model regular and semiregular polyhedra by delineating their frames in a plane. Stevinus also distinguished stable from unstable equilibrium. He proved the law of the equilibrium on an inclined plane. He demonstrated before Pierre Varignon the resolution of forces, which, simple consequence of the law of their composition though it is, had not been previously remarked. He discovered the hydrostatic paradox that the downward pressure of a liquid is independent of the shape of the vessel, and depends only on its height and base. He also gave the measure of the pressure on any given portion of the side of a vessel. He had the idea of explaining the tides by the attraction of the moon. Stevinus seems to be the first who made it an axiom that strongholds are only to be defended by artillery, the defence before his time having relied mostly on small firearms. He was the inventor of defence by a system of sluices, which proved of the highest importance for the Netherlands. His plea for the teaching of the science of fortification in universities, and the existence of such lectures in Leiden, have led to the impression that he himself filled this chair; but the belief is erroneous, as Stevinus, though living at Leiden, never had direct relations with its university.

Book-keeping by double entry may have been known to Stevinus as clerk at Antwerp either practically or through the medium of the works of Italian authors like Lucas Paccioli and Girolamo Cardan. He, however, was the first to recommend the use of impersonal accounts in the national household. He practised it for Prince Maurice, and recommended it to Sully, the French statesman.

His greatest success, however, was a small pamphlet, first published in Dutch in 1586, and not exceeding seven pages in the French translation. This translation is entitled *La Disme enseignant facilement expédier par Nombres Entiers sans rompuz tous Comptes se rencontrans aux Affaires des Hommes*. Decimal fractions had been employed for the extraction of square roots some five centuries before his time, but nobody before Stevinus established their daily use; and so well aware was he of the importance of his innovation that he declared the universal introduction of decimal coinage, measures and weights to be only a question of time. His notation is rather unwieldy. The point separating the integers from the decimal fractions seems to be the invention of Bartholomaeus Pitiscus, in whose trigonometrical tables (1612) it occurs and it was accepted by John Napier in his logarithmic papers (1614 and 1619). Stevinus printed little circles round the exponents of the different powers of one-tenth. For instance, $237\frac{578}{1000}$ was printed 237 ⓪ 5 ① 7 ② 8 ③; and the fact that Stevinus meant those encircled numerals to denote mere exponents is evident from his employing the very same sign for powers of algebraic quantities, *e.g.* 9 ④ − 14 ③ + 6 ① − 5 to denote $9x^4 - 14x^3 + 6x - 5$. He does not even avoid fractional exponents ("Racine cubique de ② serait $\frac{2}{3}$ en circle"), and is ignorant only of negative exponents.

Stevinus wrote on other scientific subjects—optics, geography, astronomy, &c.—and a number of his writings were translated into Latin by W. Snellius. There are two complete editions in French of his works, both printed at Leiden, one in 1608, the other in 1634 by Albert Girard. See Steichen, *Vie et travaux de Simon Stevin* (Brussels, 1846); M. Cantor, *Geschichte der Mathematik*. (M. CA.)

STEWART, STUART or STEUART, the surname of a family which inherited the Scottish and ultimately the English crown. Their descent is traced to a Breton immigrant, Alan the son of Flaald, which Flaald was a brother of Alan, steward (or seneschal) of Dol in Brittany. This elder Alan, whose name occurs in Breton documents before 1080, went on crusade in 1097, and was apparently succeeded by his brother Flaald, whose son, the younger Alan, enjoyed the favour of Henry I., who bestowed on him Mileham and its barony in Norfolk, where he founded Sporle Priory. By the daughter of Ernulf de Hesdin (in Picardy), a Domesday baron, he was father of at least three sons: Jordan, who succeeded to the family office of steward of Dol; William, who inherited Mileham and other estates in England, and who founded the great baronial house of Fitz Alan (afterwards earls of Arundel); and Walter, who was made by David I. steward (*dapifer*) or seneschal of Scotland. The Scottish king conferred on Walter various lands in Renfrewshire, including Paisley, where he founded the abbey in 1163. Walter, his grandson, third steward, was appointed by Alexander II. justiciary of Scotland, and, dying in 1246, left four sons and three daughters. The third son, Walter, obtained by marriage the earldom of Menteith, which ultimately came by marriage to Robert, duke of Albany, son of Robert II. Alexander, fourth steward, the eldest son of Walter, third steward, inherited by his marriage with Jean, granddaughter of Somerled, the islands of Bute and Arran, and on the 2nd of October 1263 led the Scots against Haakon IV., king of Norway, at Largs. He had two sons, James and John. The latter, who commanded the men of Bute at the battle of Falkirk in 1298, had seven sons: (1) Sir Alexander, whose grandson George became in 1389 earl of Angus, the title afterwards passing in the female line to the Douglases, and in 1761 to the duke of Hamilton; (2) Sir Alan of Dreghorn, ancestor of the earls and dukes of Lennox, from whom Lord Darnley, husband of Queen Mary, and also Lady Arabella Stuart, were descended; (3) Sir Walter, who obtained the barony of Garlies, Wigtownshire, from his uncle John Randolph, earl of Moray, and was the ancestor of the earls of Galloway, younger branches of the family being the Stewarts of Tonderghie, Wigtownshire, and also those of Physgill and Glenturk in the same county; (4) Sir James, who fell at Dupplin in 1332, ancestor of the lords of Lorn, on whose descendants were conferred at different periods the earldoms of Athole, Buchan and Traquair, and who were also the progenitors of the Stewarts of Appin, Argyllshire, and of Grandtully, Perthshire; (5) Sir John, killed at Halidon Hill in 1333; (6) Sir Hugh, who fought under Edward Bruce in Ireland; and (7) Sir Robert of Daldowie, ancestor of the Stewarts of Allanton and of Coltness. James Stewart, the elder son of Alexander, fourth steward, succeeded his father in 1283, and, after distinguishing himself in the wars of Wallace and of Bruce, died in 1309. His son Walter, sixth steward, who had joint command with Sir James Douglas of the left wing at the battle of Bannockburn, married Marjory, daughter of Robert the Bruce, and during the latter's absence in Ireland was entrusted with the government of the kingdom. He died in 1326, leaving an only son, who as Robert II. ascended the throne of Scotland in 1371. Sir Alexander Stewart, earl of Buchan, fourth son of Robert II., who earned by his ferocity the title of the "Wolf of Badenoch," inherited by his wife the earldom of Ross, but died without legitimate issue, although from his illegitimate offspring were descended the Stewarts of Belladrum, of Athole, of Garth, of Urrard and of St Fort. On the death of the "Wolf of Badenoch" the earldom of Buchan passed to his brother Robert, duke of Albany, also earl of Fife and earl of Menteith, but these earldoms were forfeited on the execution of his son Murdoch in 1425, the earldom of Buchan again, however, coming to the house of Stewart in the person of James, second son of Sir James Stewart, the black knight of Lorn, by Joan or Joanna, widow of King James I. From Murdoch, duke of Albany, were descended the Stewarts of Ardvoirlich and other families of the name in Perthshire, and also the Stuarts of Inchbreck and Laithers, Aberdeenshire. From a natural son of Robert II. were descended the Steuarts of Dalguise, Perthshire, and from a natural son of Robert III. the Shaw Stewarts of Blackhall and Greenock. The direct male line of the royal family terminated with the death of James V. in 1542, whose daughter Mary was the first to adopt the spelling "Stuart." Mary was succeeded in her lifetime in 1567 by her only son James VI., who through his father Lord Darnley was also head of the second branch, there being no surviving male issue of the family from progenitors later than Robert II. In James V., son of James IV. by Margaret, daughter of Henry VII., the claims of Margaret's descendants became merged in the Scottish line, and on the death of Queen Elizabeth of England, the last surviving descendant of Henry VIII., James VI. of Scotland, lineally the nearest heir, was proclaimed king of England, in accordance with the arrangements made by Lord Burghley and Elizabeth's other advisers. The accession of James, was, however, contrary to the will of Henry VIII., which favoured the heirs of his younger sister Mary, wife of Charles Brandon, duke of Suffolk, whose succession would probably have marvellously altered the complexion of both Scottish and English history. As it was, the only result of that will was a tragedy initiated by Elizabeth and consummated by James. In the Scottish line the nearest heir after James VI., both to the Scottish and English crowns, was Arabella Stuart, only child of Charles, earl of Lennox, younger brother of Lord Darnley—Lady Margaret Douglas, the mother of Darnley and his brother, having been the daughter of Archibald, sixth earl of Angus, by Margaret of England, queen dowager of James IV. James VI. (I. of England) was thus nearest heir by a double descent, Arabella Stuart being next heir by a single descent. On account of the descent from Henry VII., the jealousy of Elizabeth had already caused her to imprison Arabella's mother Elizabeth, daughter of Sir William Cavendish, on learning that she had presumed to marry Lennox. The daughter's marriage she was determined by every possible means to prevent. She objected when King James proposed to marry her to Lord Esme Stuart, whom he had created duke of Lennox, but when the appalling news reached her that Arabella had actually found a lover in Edward Seymour, grandson of Catherine Grey, heiress of the Suffolks, she was so deeply alarmed and indignant that she immediately ordered her imprisonment. This happened immediately before Elizabeth's death, after which she obtained her release. Soon after the accession of James a conspiracy, of which she was altogether ignorant, was entered into to advance her to the throne, but this caused no alteration in her treatment by James, who allowed her a maintenance of £800 a year. In February 1610 it was discovered that she was engaged to Seymour, and, although she then promised never to marry him without the king's consent, the marriage took place secretly in July following. In consequence of this her husband was sent to the Tower and she was placed in private confinement. Though separated, both succeeded in escaping simultaneously on the 3rd of June 1611; but, less fortunate than her husband, who got safe to the Continent, she was captured in the straits of Dover and shut up in the Tower of London. Her hopeless captivity deprived her of her reason before her sorrows were ended by death, on the 27th of September 1615.

By the usurpation of Cromwell the Stuarts were excluded from the throne from the defeat of Charles I. at Naseby in 1645 until the restoration of his son Charles II. in 1660. Carlyle refers to the opinion of genealogists that Cromwell "was indubitably either the ninth or the tenth or some other fractional part of half a cousin of Charles Stuart," but this has been completely exploded by Walter Rye in the *Genealogist* ("The Steward Genealogy and Cromwell's Royal Descent," new series, vol. ii. pp. 34–42). On the death of Charles II. without issue in 1685, his brother James, duke of York, ascended the throne as James II. but he so alienated the sympathies of the nation by his unconstitutional efforts to further the Roman Catholic religion that an invitation was sent to the prince of Orange to come "to the rescue of the laws and religion of England."

Next to the son of James II., still an infant under his father's control, Mary, princess of Orange, elder daughter of James II., had the strongest claim to the crown; but the claims of the prince of Orange also, even apart from his marriage, were not very remote, since he was the son of Mary, eldest daughter of Charles I. The marriage had strengthened the claims of both, and they were proclaimed joint sovereigns of England on the 12th of February 1689, Scotland following the example of England on the 11th of April. They left no issue, and the Act of Settlement passed in 1701, excluding Roman Catholics from the throne, secured the succession to Anne, second daughter of James II., and on her death without issue to the Protestant house of Hanover, descended from the princess Elizabeth, daughter of James I., wife of Frederick V., count palatine of the Rhine. On the death of Anne in 1714, George, elector of Hanover, eldest son of Sophia (youngest child of the princess Elizabeth), and Ernest, elector of Brunswick-Lüneburg, or Hanover, consequently became sovereign of Great Britain and Ireland, and, notwithstanding somewhat formidable attempts in behalf of the elder Stuart line in 1715 and 1745, the Hanoverian succession has remained uninterrupted and has ultimately won universal assent. The female issue of James II. ended with the death of his daughter, Queen Anne. James, called James III. by the Jacobites and the Old Pretender by the Hanoverians, had two sons—Charles Edward, the Young Pretender, who died without legitimate issue in 1780, and Henry Stuart, titular duke of York, commonly called Cardinal York, on whose death in 1807 the male line of James II. came to an end. Henry was also the last descendant in the lineal male line of any of the crowned heads of the race, so far as either England or Scotland was concerned. In the female line, however, there are among the descendants of James I. representatives of the royal Stuarts who are senior to the house of Hanover, for Philip, duke of Orleans (brother of Louis XIV.), married, as his first wife, Henrietta daughter of Charles I., and, as his second, Charlotte, granddaughter and heiress of the princess Elizabeth (daughter of James I.). By the former, through their daughter, the queen of Sardinia, he was ancestor, among others, of the princess Maria Theresa of Bavaria, who in 1910 was "heir of line" of the house of Stuart, her eldest son, Prince Rupert, being heir to the throne of Bavaria; and from his second marriage descends the house of Orleans. In addition to those descended from these two marriages there are also the descendants of Edward, a brother of the electress Sophia. The male representation of the family, being extinct in the royal lines, is claimed by the earls of Galloway and also by the Stewarts of Castlemilk, but the claims of both are more than doubtful.

See Sir George Mackenzie, *Defence of the Royal Line of Scotland* (1685), and *Antiquity of the Royal Line of Scotland* (1686); Crawfurd, *Genealogical History of the Royal and Illustrious Family of the Stuarts* (1710); Duncan Stewart, *Genealogical Account of the Surname of Stewart* (1739); Andrew Stuart, *Genealogical History of the Stuarts* (1798); Stodart, *House of Stuart* (privately printed, 1855); *An Abstract of the Evidence to Prove that Sir William Stewart of Jedworth, the Paternal Ancestor of the Present Earl of Galloway, was the Second Son of Sir Alexander Stewart of Darnley* (1801); Riddell, *Stewartiana* (1843); W. Townend, *Descendants of the Stuarts* (1858); R. W. Eyton, *History of Shropshire* (1858), vol. vii.; Bailey, *The Succession to the English Crown* (1879); Skelton, *The Royal House of Stuart* (1890); J. H Round, *Studies in Peerage and Family History* (1901); and S. Cowan, *The Royal House of Stuart* (1908). The best chart pedigree of the house is that which was prepared for the Stuart Exhibition by W. A. Lindsay.

STEWART, ALEXANDER TURNEY (1803–1876), American merchant, was born, of Scotch descent, at Lisburn, near Belfast, Ireland, on the 12th of October 1803. He studied for the ministry for about two years at Trinity College, Dublin, emigrated to New York in 1823, and in 1825 opened a small dry goods store In 1848 he built at the corner of Chambers Street and Broadway a store which became the wholesale department upon the completion in 1862 of the large store on Broadway between Ninth and Tenth Streets. The business grew to enormous proportions for those days, with foreign branches in Manchester, Belfast, Glasgow, Berlin, Paris and Lyons. Stewart was chairman of the commission sent by the United States to the Paris Exposition of 1867. In 1869 he was appointed secretary of the treasury by President U. S. Grant, but the Senate refused to confirm the appointment because of an old law excluding from the office any one interested in the importation of merchandise. Grant asked Congress to repeal the law, and Stewart offered to transfer his business to trustees and to give its proceeds while he held office to charitable institutions, but the nomination was never confirmed. Stewart sent to Ireland a shipload of provisions during the famine of 1846; he manufactured and sold to the government, at less than the prevailing rates, great quantities of cotton cloth for the use of the army during the Civil War; he took an active part in the prosecution of the "Tweed Ring" in New York; he sent a shipload of flour to the French sufferers from the Franco-German War, and he gave $50,000 to the sufferers from the Chicago fire of 1871. In 1869 he bought some 7000 acres on the Hempstead Plain, Long Island, New York, and established Garden City for working men. The cathedral of the Incarnation (Protestant Episcopal) dedicated in 1885, was erected in Garden City by Stewart's widow as a memorial to him. He died in New York on the 10th of April 1876,[1] leaving the bulk of his great fortune to his widow, Mrs Cornelia (Clinch) Stewart (1802–1886)[2]. His large art collection was sold by auction in New York in 1887.

See William O. Stoddard, "Alexander Turney Stewart," in *Men of Business* (New York, 1893); "A Merchant Prince," in *Chambers's Journal* (1876), vol. liii.; Edward Crapsey, "A Monument of Trade," in *The Galaxy* (1882), vol. ix.; "Stewart's," in *The Nation* (1882), vol. xxxiv.; "The Story of a Millionaire's Grave," in *Chambers's Journal* (1888), vol. lxv.; and George W. Walling, *Recollections of a New York Chief of Police* (New York, 1887).

STEWART, BALFOUR (1828–1887), Scottish physicist, was born in Edinburgh on the 1st of November 1828, and was educated at the university of that city. The son of a tea merchant, he was for some time engaged in business in Leith and in Australia, but, returning to his studies of physics at Edinburgh, he became assistant to J. D. Forbes in 1856. Forbes was especially interested in questions of heat, meteorology, and terrestrial magnetism, and it was to these that Stewart also mainly devoted himself. Radiant heat first claimed his attention, and by 1858 he had completed his first investigations into the subject. These yielded a remarkable extension of Pierre Prévost's "Law of Exchanges," and enabled him to establish the fact that radiation is not a surface phenomenon, but takes place throughout the interior of the radiating body, and that the radiative and absorptive powers of a substance must be equal, not only for the radiation as a whole, but also for every constituent of it. In recognition of this work he received in 1868 the Rumford medal of the Royal Society, into which he had been elected six years before, Of other papers in which he dealt with this and kindred branches of physics may be mentioned "Observations with a Rigid Spectroscope," "Heating of a Disc by Rapid Motion in Vacuo," "Thermal Equilibrium in an Enclosure Containing Matter in Visible Motion," and "Internal Radiation in Uniaxal Crystals." In 1859 he was appointed director of Kew Observatory, and there naturally became interested in problems of meteorology and terrestrial magnetism. In 1870, the year in which he was very seriously injured in a railway accident, he was elected professor of physics at Owens

[1] On the 6th of November 1878 his body was stolen from St Mark's churchyard in New York, but recovered in 1881 upon the payment of $20,000, and buried in the crypt of the cathedral in Garden City.

[2] Upon her death she left a small part of her estate to her other relatives and her servants, about $4,631,000 to Charles J. Clinch, a kinsman, and about $9,262,000 to Judge Henry Hilton (1824–1899), a business associate of Stewart, who had received a legacy of $1,000,000 from Stewart, and who managed Mrs Stewart's business affairs after her husband's death. Clinch and Hilton were executors, and it was understood that Hilton should complete the cathedral at Garden City and endow schools there. A nephew of Mrs Stewart in 1887 sued to break the will on the ground that Hilton had unduly influenced her; the case was compromised out of court in 1890 and Mrs Stewart's relatives received more of her estate than they would have got under the terms of the testament.

College, Manchester, and retained that chair until his death, which happened near Drogheda, in Ireland, on the 19th of December 1887. He was the author of several successful textbooks of science, and also of the article on "Terrestrial Magnetism" in the ninth edition of this Encyclopaedia. In conjunction with Professor P. G. Tait he wrote *The Unseen Universe*, at first published anonymously, which was intended to combat the common notion of the incompatibility of science and religion.

STEWART, CHARLES (1778–1869), American naval officer, was born at Philadelphia, Pennsylvania, on the 28th of July 1778, of poor Irish parents. At the age of thirteen he shipped as cabin boy on a merchant vessel, and soon commanded a ship in the India trade. He entered the United States navy in March 1798 as lieutenant on the frigate "United States," and in 1800, when in command of the "Experiment," took the French privateers "Deux Amis" and "Diane." In 1802–4 he served against Tripoli, first as executive officer of the "Constellation" and then as commander of the "Siren." In 1806 he became a captain. From 1808 to 1812 he was in the merchant service, but on the outbreak of hostilities against Great Britain returned to the navy, and with Commander William Bainbridge is said to have persuaded President Madison to send the navy to sea instead of using it only for harbour defence. Placed in the command of the "Constellation," he was closely blockaded at Norfolk, Virginia. In 1813 he was placed in command of the "Constitution," and in February 1815 captured the "Cyane" and the "Levant," though the "Levant" was retaken. Later he commanded the Mediterranean squadron, the Pacific squadron, the home squadron and the Philadelphia navy yard. He was retired in 1855, and became rear-admiral on the retired list in 1862. He died in Bordentown, New Jersey, on the 6th of November 1869. His daughter, Delia Tudor, married, in 1834, John Henry Parnell, and became the mother of the Irish leader, Charles Stewart Parnell.

STEWART, SIR DONALD MARTIN (1824–1900), British field marshal, son of Robert Stewart of Forres, Elginshire, was born at Mount Pleasant, near Forres, on the 1st of March 1824. Educated at schools at Findhorn, Dufftown and Elgin, and at Aberdeen University, he entered the Bengal army in 1840, and served in 1854 and 1855 in the frontier expeditions against the Mohmands, and Afridis Aka and Bari Khel (medal and clasp). In the Indian Mutiny in 1857 Stewart, after a famous ride from Agra to Delhi with despatches, served on the staff at the siege and capture of Delhi and of Lucknow, and afterwards through the campaign in Rohilkhand (medal and two clasps, and brevet-major and lieutenant-colonel). For nine years he was assistant and deputy-adjutant-general of the Bengal army, commanded the Bengal brigade in the Abyssinian expedition in 1867 (medal and C.B.), and became a major-general in 1868. He reorganized the penal settlement of the Andaman Islands, where he was commandant when Lord Mayo was assassinated, and, after holding the Lahore command, was promoted lieutenant-general in 1877, and commanded the Kandahar field force in the Afghan War in 1878 (K.C.B. and thanks of parliament). In 1880 he made a difficult march from Kandahar to Kabul, fighting on the way the battles of Ahmed Khel and Urzu, and held supreme military and civil command in northern Afghanistan. On hearing of the Maiwand disaster, he despatched Sir Frederick Roberts with a division on his celebrated march from Kabul to Kandahar, and himself led the rest of the army back to India by the Khyber Pass (medal with clasp, G.C.B., C.I.E., baronetcy, and thanks of parliament). Promoted general in 1881, he was for five years commander-in-chief in India, and afterwards member of the council of the secretary of state for India until his death. He was made G.C.S.I. in 1885, promoted to be field marshal in 1894, and appointed governor of Chelsea Hospital in 1895. He died at Algiers on the 26th of March 1900.

See G. R. Elsmie, *Sir Donald Stewart* (1903).

STEWART, DUGALD (1753–1828), Scottish philosopher, was born in Edinburgh on the 22nd of November 1753. His father, Matthew Stewart (1715–1785), was professor of mathematics in the university of Edinburgh (1747–1772). Dugald Stewart was educated in Edinburgh at the high school and the university, where he read mathematics and moral philosophy under Adam Ferguson. In 1771, in the hope of gaining a Snell exhibition and proceeding to Oxford to study for the English Church, he went to Glasgow, where he attended the classes of Thomas Reid. While he owed to Reid all his theory of morality, he repaid the debt by giving to Reid's views the advantage of his admirable style and academic eloquence. In Glasgow Stewart boarded in the same house with Archibald Alison, author of the *Essay on Taste*, and a lasting friendship sprang up between them. After a single session in Glasgow, Dugald Stewart, at the age of nineteen, was summoned by his father, whose health was beginning to fail, to conduct the mathematical classes in the university of Edinburgh. After acting three years as his father's substitute he was elected professor of mathematics in conjunction with him in 1775. Three years later Adam Ferguson was appointed secretary to the commissioners sent out to the American colonies, and at his urgent request Stewart lectured as his substitute. Thus during the session 1778–1779, in addition to his mathematical work, he delivered an original course of lectures on morals. In 1783 he married Helen Bannatyne, who died in 1787, leaving an only son, Colonel Matthew Stewart. In 1785 he succeeded Ferguson in the chair of moral philosophy, which he filled for a quarter of a century and made a centre of intellectual and moral influence. Young men were attracted by his reputation from England, and even from the Continent and America. Among his pupils were Sir Walter Scott, Jeffrey, Cockburn, Francis Horner, Sydney Smith, Lord Brougham, Dr Thomas Brown, James Mill, Sir James Mackintosh and Sir Archibald Alison. The course on moral philosophy embraced, besides ethics proper, lectures on political philosophy or the theory of government, and from 1800 onwards a separate course of lectures was delivered on political economy, then almost unknown as a science to the general public. Stewart's enlightened political teaching was sufficient, in the times of reaction succeeding the French Revolution, to draw upon him the undeserved suspicion of disaffection to the constitution. The summers of 1788 and 1789 he spent in France, where he met Suard, Degérando, Raynal, and learned to sympathize with the revolutionary movement.

In 1790 Stewart married a second time. Miss Cranstoun, who became his wife, was a lady of birth and accomplishments, and he was in the habit of submitting to her criticism whatever he wrote. A son and a daughter were the issue of this marriage. The death of the former in 1809 was a severe blow to his father, and was the immediate cause of his retirement from the active duties of his chair. Before that, however, Stewart had not been idle as an author. As a student in Glasgow he wrote an essay on *Dreaming*. In 1792 he published the first volume of the *Elements of the Philosophy of the Human Mind*; the second volume appeared in 1814, and the third not till 1827. In 1793 he printed a textbook, *Outlines of Moral Philosophy*, which went through many editions; and in the same year he read before the Royal Society of Edinburgh his account of the *Life and Writings of Adam Smith*. Similar memoirs of Robertson the historian and of Reid were afterwards read before the same body and appear in his published works. In 1805 Stewart published pamphlets defending Mr (afterwards Sir John) Leslie against the charges of unorthodoxy made by the presbytery of Edinburgh. In 1806 he received in lieu of a pension the nominal office of the writership of the *Edinburgh Gazette*, with a salary of £300. When the shock of his son's death incapacitated him from lecturing during the session of 1809–1810, his place was taken, at his own request, by Dr Thomas Brown, who in 1810 was appointed conjoint professor. On the death of Brown in 1820 Stewart retired altogether from the professorship, which was conferred upon John Wilson, better known as "Christopher North." From 1809 onwards Stewart lived mainly at Kinneil House, Linlithgowshire, which was placed at his disposal by the duke of Hamilton. In 1810 appeared the *Philosophical Essays*, in 1814 the second volume of the *Elements*, in 1815 the first part and in 1821 the second part of the "Dissertation" written for the *Encyclopaedia Britannica* "Supplement," entitled "A General View of the Progress of Metaphysical, Ethical, and Political Philosophy since the Revival of Letters." In 1822 he was struck with paralysis, but recovered a fair degree of health, sufficient to enable him to resume his studies. In 1827 he published the third volume of the *Elements*, and in 1828, a few weeks before his death, *The Philosophy of the Active and Moral Powers*. He died in Edinburgh on the 11th of June 1828. A monument to his memory was erected on Calton Hill.

Stewart's philosophical views are mainly the reproduction of his master Reid (for his ethical views see ETHICS). He upheld Reid's psychological method and expounded the "common-sense" doctrine, which was attacked by the two Mills. Unconsciously, however, he fell away from the pure Scottish tradition and made concessions both to moderate empiricism and to the French ideologists (Laromiguière, Cabanis and Destutt de Tracy). It is important to notice the energy of his declaration against the argument of ontology, and also against Condillac's sensationalism. Kant, he confessed, he could not understand. Perhaps his most valuable and original work is his theory of taste in the *Philosophical Essays*. But his reputation rests rather on his inspiring eloquence and the beauty of his style than on original work.

Stewart's works were edited in 11 vols. (1854–1858) by Sir William Hamilton and completed with a memoir by John Veitch. Matthew Stewart (his eldest son) wrote a life in *Annual Biography and Obituary* (1829), republished privately in 1838. For his philosophy see McCosh, *Scottish Philosophy* (1875), pp. 162–173; A. Bain, *Mental Science*, pp. 208, 313 and app. 29, 65, 88, 89; *Moral Science*, pp. 639 seq.; Sir L. Stephen, *English Thought in the XVIIIth Century*.

STEWART, SIR HERBERT (1843–1885), British soldier, eldest son of the Rev. Edward Stewart, was born on the 30th of June 1843 at Sparsholt, Hampshire. He was educated at Winchester and entered the army in 1863. After serving in India with his regiment (37th Foot) he returned to England in 1873, having exchanged into the 3rd Dragoon Guards. In 1877 he entered the staff college and also the Inner Temple. In 1878 he was sent out to South Africa, served in the Zulu War and against Sikukuni. As chief staff officer under Sir G. Pomeroy Colley he was present at Majuba (Feb. 27, 1881), where he was made prisoner by a Boer patrol and detained until the end of March. In August 1882 he was placed on the staff of the cavalry division in Egypt. After Tel-el-Kebir (Sept. 13, 1882) he headed a brilliant advance upon Cairo, and took possession of the town and citadel. He was three times mentioned in despatches, and made a brevet-colonel, C.B., and aide-de-camp to the queen. In January 1884 he was sent to Suakin in command of the cavalry under Sir Gerald Graham, and took part as brigadier in the actions from El Teb to the advance on Tamaneb. His services were recognized by the honour of K.C.B., and he was assistant adjutant and Q.M.G. in the south-eastern district in England from April to September 1884. He then joined the expedition for the relief of Khartum, and in December, when news from Gordon decided Lord Wolseley to send a column across the desert of Metemma, Stewart was entrusted with the command. On the 16th of January 1885, he found the enemy in force near the wells of Abu Klea, and brilliantly repulsed their fierce charge on the following morning. Leaving the wounded under guard, the column moved forward on the 18th through bushy country towards Metemma, 23 m. off. Meanwhile the enemy continued their attacks, and on the morning of the 19th Stewart was wounded and obliged to hand over the command to Sir Charles Wilson. He lingered for nearly a month, living long enough to hear of his promotion to the rank of major-general "for distinguished service in the field." He died on the way back from Khartum to Korti on the 16th of February, and was buried near the wells of Jakdul. In the telegram reporting his death Lord Wolseley summed up his character and career in the words: "No braver soldier or more brilliant leader of men ever wore the Queen's uniform."

STEWART, J. (?**JAMES**), of Baldynneis (*fl.* 1590), Scottish verse writer, is known as the translator of Ariosto's *Orlando Furioso*. The work is an abridgment in twelve cantos and has the historical interest of having preceded Sir John Harington's translation (1591). The volume containing this version and other poems (of indifferent quality) is preserved in the Advocates' Library, Edinburgh. It bears the title *Ane Abbregement of Roland Fvriovs, translait ovt of Aroist: togither vith sym Rapsodies of the Avthor's yovthfvll braine, and last ane Schersing ovt of trew Felicitie; composit in Scotis meiter be J. Stewart of Baldynneis*. This MS. appears to be the original which was once in the possession of James VI. Extracts are printed in Irving's *History of Scotish Poetry* (1861).

STEWART, JOHN (1749–1822), British traveller, was born in London of humble parentage. After an unruly career at school he entered the service of the East India Company at Madras in 1763, but he threw up his position about two years later and became interpreter to Hyder Ali, afterwards serving as a general in his army; subsequently he served the nabob of Arcot, whose chief minister he became. Having enriched himself in this capacity, he began a series of travels through India, Persia, Ethiopia and Abyssinia, which earned him the nickname of "Walking Stewart." About 1783 he returned to Europe, where he cut a curious figure by wearing Armenian dress. He crossed over to America in 1791 and had various adventures, but soon came back to Europe, and made the acquaintance of Wordsworth in Paris and later of De Quincey in Bath. Becoming short of money, he again went to America, where he supported himself by lecturing. Having returned to Europe, Stewart's fortunes began to mend. In 1813 a claim he had made against the nabob of Arcot was settled by the East India Company for £10,000, and he took rooms in London and settled down to enjoy life, airing his opinions on literature and art. He died on the 20th of February 1822. De Quincey (see *Collected Writings*, 1890, vol. iii.) gives various particulars of him.

STEWART, JULIUS L. (1855–   ), American artist, was born at Philadelphia on the 6th of September 1855. His father, William Hood Stewart, was a distinguished collector of the fine arts, an early patron of Fortuny and the Barbizon artists, and lived in Paris during the latter part of his life. The son was a pupil of J. L. Gérôme, at the École des Beaux Arts, and of Raymondo de Madrazo. Among his principal paintings are "The Hunt Ball," Essex Club, Newark, New Jersey; "Full Speed," in James Gordon Bennett's collection; "Five o'clock Tea," and "Court in Cairo."

STEWART, WILLIAM (*c.* 1480–*c.* 1550), Scottish poet and translator, descendant of one of the illegitimate sons of Alexander Stewart, earl of Buchan, the "Wolf of Badenoch," was a member of the university of St Andrews. He was in orders, and a hanger-on at the court of James V. The last entry of the payment of a pension of £40 appears in the accounts of 1541. He was known as a poet in his own day: Lyndsay and Rolland refer to him. Portions of his minor verse are preserved in the Bannatyne and Maitland Folio MSS. His chief work is a metrical translation of Hector Boece's *History*, in obedience to the command of James V., who entrusted Bellenden with its translation into Scots prose.

Stewart's version remained in MS. till 1858, when it was edited by W. Turnbull for the "Rolls Series" (3 vols.). The MS. is now in the library of the university of Cambridge.

STEWART, SIR WILLIAM (*c.* 1540–*c.* 1605), Scottish politician, began life as a soldier in the Netherlands, where he became a colonel and entered into communications with Lord Burghley on the progress of affairs. In the year 1582 he was in Scotland, where James VI. made him captain of his guard. Having visited the English court in the king's interest in 1583, Stewart helped to free James from William Ruthven, earl of Gowrie, and to restore James Stewart, earl of Arran, to power; he was made a privy councillor and for a time assisted Arran to govern Scotland. In 1584 he captured Gowrie at Dundee. In 1585 he and Arran lost their power, and Stewart went to Denmark and France on secret errands for the king. He commanded the ships which conveyed James and his bride Anne from Denmark in 1590, and the same year was sent on an embassy to the German princes. Twice he went on missions to the Netherlands, and in 1594 he was knighted and was given lands at Houston. He died before 1606. His only son, Frederick (c. 1590–1625), who was created a peer as Lord Pittenweem in 1609, died childless in December 1625.

Sir William Stewart of Houston is often confused with Sir William Stewart of Monkton (d. 1588), a brother of James Stewart, earl of Arran, who was killed in a fight in Edinburgh in July 1588, and also with Sir William Stewart of Caverstoun.

STEWARTON, a municipal and police burgh, in the Cunningham district of Ayrshire, Scotland. Pop. (1901), 2858. It is situated on Annick Water, 19 m. S.W. of Glasgow by the Glasgow & South-Western railway. The town lies in a fine agricultural district, famed for its dairy produce. Two cattle and two horse fairs are held yearly; at the October cattle fair there is the largest show of Ayrshire dairy stock in Scotland. About 2 m. north by west is Dunlop (pop. 473), which gave its name to a cheese that at one time commanded a large market.

STEYN, MARTINUS THEUNIS (1857–), last president of the Orange Free State, was born at Winburg in that state on the 2nd of October 1857. He was a student in Holland and later in England at the Inner Temple, and was called to the English bar in November 1882. After his return to South Africa he practised as a barrister at Bloemfontein, and in 1889 was appointed state attorney of the Free State. A few months afterwards he became second puisne judge, and in 1893 first puisne judge of the high court. His decisions won him a reputation for ability and sound judgment. In 1895, upon the resignation of President F. W. Reitz, Steyn was the candidate of the pan-Dutch party for the vacant post. The election resulted (February 1896) in a decisive victory for Steyn. As president he linked the fortunes of his state with those of the Transvaal, a policy which led to the extinction of the republic. After the occupation of Bloemfontein by Lord Roberts Steyn wandered about South Africa, carrying on a semblance of government, and on occasion taking charge of military operations. More than once he narrowly escaped capture. Regarded as one of the most irreconcilable of the Boer leaders, he took part, however, in the preliminary peace negotiations at Klerksdorp in April 1902, but was prevented by illness from signing the instrument of surrender at Pretoria on the 31st of May. At that date he was suffering from locomotor ataxy, brought on by his constant exertions; and in the July following he sailed for Europe, where he remained until the autumn of 1904. He then took the oath of allegiance to the British crown, and returning to South Africa partially restored to health resumed an active participation in politics. In 1908–1909 he was vice-president of the Closer Union Convention, where he was distinguished for his statesmanlike and conciliatory attitude, while maintaining the rights of the Dutch community.

STEYNING, a small market town in the mid parliamentary division of Sussex, England, 10½ m. W.N.W. of Brighton by the London, Brighton & South Coast railway. Pop. (1901), 1705. The church of St Andrew retains a very fine series of Norman pier-arches in the nave. Some picturesque old houses remain in the town. Brewing and the manufacture of parchment are carried on.

The Anglo-Saxon church of Steyning (Stoeningas, Stoeningum, Staninges, Stenyges, Stenyng) mentioned in Domesday is attributed to St Cuthman, who is said to have settled here before the 9th century, and whose shrine became a resort for pilgrims. The later prosperity of the town was due to its harbour. Alfred bequeathed Steyning to his nephew, but it evidently reverted to the Crown, as it was granted by Edward the Confessor to the abbot and convent of Fécamp, with whom it remained until the 15th century. By 1086 Steyning was a thriving port. It had a market, a mint and two churches, and the borough contained 123 burgages. The decay of the town began in the 14th century owing to the recession of the sea, and it received another blow in the suppression of its priory by Henry IV. It was afterwards granted to the abbey of Sion, which held it until the dissolution. From the reign of Edward IV. to that of Richard III. there is evidence that the town was governed by a bailiff elected annually in the borough-court. Steyning returned two representatives to parliament from 1298 until it was disfranchised in 1832. In the 14th century the abbot of Fécamp held weekly markets in the borough on Wednesdays and Saturdays, and fairs at the Nativity of the Virgin and the Feast of St Michael, by prescriptive right. The present market day is Wednesday, for stock, and a cattle fair is held on the 11th of October.

STEYR, or STEIER, a town in Upper Austria, 28 m. S.E. of Linz by rail. Pop. (1900), 17,592. It is situated at the confluence of the Steyr with the Enns, and on an eminence rises the castle of the princes of Lamberg, dating from the 10th century. The parish church is in Gothic style and was built in 1443–1522. Steyr is the chief centre of the steel and iron industry of Upper Austria. The rifle factory, founded in 1830 by Josef Werndl, is the largest in Austria, and since 1882 it has added the manufacture of bicycles and electrical plant. It is the birthplace of the poet Alois Blumauer (1755–1798). Steyr was founded at the end of the 10th century and was the capital of a countship, first belonging to Styria, but annexed to Austria in 1192.

STIBNITE, a mineral consisting of antimony sulphide, Sb_2S_3, occurring as bladed or acicular orthorhombic crystals; an important ore of antimony. It was mentioned by Dioscorides and Pliny under the names *stimmi, stibi* and *platyophthalmon* (πλατυόφθαλμον); the last name refers to the use which the ancients made of the powdered mineral for darkening the eyebrows to increase the apparent size of the eyes. Antimonite is a name in common use for this species. The crystals are prismatic in habit, deeply furrowed longitudinally, and usually terminated by acute pyramidal planes. There is a perfect cleavage (010) parallel to the length of the crystals, and the basal plane (001) is a plane of gliding; the latter gives rise to very characteristic transverse striations or nicks on the cleavage surfaces of crystals which have been bent. The colour is lead-grey, and the lustre metallic and brilliant; crystals become dull on prolonged exposure to light. Cleavage flakes of extreme thinness transmit a small amount of red light, but are more transparent for heat rays. The mineral is quite soft (H. = 2), and has a specific gravity of 4·6. Stibnite occurs with quartz in beds and veins in gneisses and schists, or with blende, galena, &c., in metalliferous veins. Magnificent groups of brilliant crystals, up to 20 in. in length, are abundant in the extensive antimony mine of Ichinokawa, province of Iyo, Japan. Large, but dull, crystals have also been found at Lubilhac in Haute-Loire, France. Prismatic and acicular crystals often penetrating tabular crystals of barytes, are common at Felsöbánya near Magy-Bánya and Kremnitz in Hungary. (L. J. S.)

STICHOMETRY, a term applied properly to the measurement (μέτρον) of ancient texts by στίχοι (lit. "rows") or verses of a fixed standard length. It was the custom of the Greeks and Romans to estimate the length of their literary works by measured lines. In poetical works the number of metrical verses was computed; in prose works a standard line had to be taken, for no two scribes would naturally write lines of the same length. On the authority of Galen (*de Placit. Hipp. et Plat.* viii. 1) we learn that the unit of measurement among the Greeks was the average Homeric line, consisting of about 36 letters, or 16 syllables. The lines so measured were called στίχοι or ἔπη. The practice of thus computing the length of a work can be traced back to the 4th century B.C. in the boast of Theopompus that he had written more ἔπη than any other writer. The number of such στίχοι or ἔπη contained in a papyrus roll was recorded at the end of the work; and at the end of a large work extending to several rolls the grand total was given. The object of such stichometrical calculations was a commercial one, viz. to assess the pay of the scribe and the market value of the MS. Callimachus, when he drew up his catalogue of the Alexandrian libraries in the 3rd century B.C., registered the total of the στίχοι in each work. Although he is generally lauded for thus carefully recording the numbers and setting an example to all who should follow him, it has been suggested that this very act was the cause of their general disappearance from MSS.; for that, when his *πίνακες* were published, scribes evidently thought it was needless to repeat what could be found there; and thus it is that so few MSS. have descended to us which are marked in this way. A more natural reason for the scarcity of such details is that scribes and booksellers suppressed them in order to impose upon their customers.

The application of the system to Latin MSS. was fully recognized. The unit of measurement was the average Virgilian line. This is recorded in an interesting memorandum written in the 4th century, found in a MS. in the Phillipps Library at Cheltenham, containing a computation of the *στίχοι* in the books of the Bible and the works of Cyprian. The writer states that in the city of Rome it had become the practice not to record the number of verses in the MSS., and that elsewhere also, for greed of gain, the numbers were suppressed. Therefore he has made a calculation of the contents of the text under his hand and has appended to the several books the number of Virgilian hexameters which would represent its length. The rate of pay of the scribes in Diocletian's reign was fixed by his edict *de pretiis rerum venalium* at 25 denarii for 100 *στίχοι* in writing of the first quality, and at 20 denarii for the second quality; what the difference was between the two qualities does not appear.

The system of measurement described above has been called "total stichometry," in distinction from "partial stichometry," which was the calculation and marking off in the margins of the *στίχοι* from point to point, just as we mark off the lines in a poem at convenient intervals and number the verses of the chapters of the Bible. This method was for convenience of literary reference. Instances of such "partial stichometry" are not very numerous among existing MSS., but they are sufficient to show that the system was in vogue. In the Bankes Homer in the British Museum the verses are numbered in the margin by hundreds, and the same practice was followed in other Homeric papyri. In the Ambrosian Pentateuch of the 5th century at Milan the book of Deuteronomy is likewise numbered at every hundredth *στίχος*. Euthalius, a deacon of Alexandria of the 5th century, marked the *στίχοι* of the Pauline epistles by fifties. In the Codex Urbinus of Isocrates, and in the Clarke Plato of A.D. 888, at Oxford, there are indications of partial stichometry.

There was also in use in biblical texts and in rhetorical works a stichometrical system different from that described above, in which the *στίχοι*, as we have seen, were lines of measurement or *space*-lines. This other system, which is more correctly entitled colometry (see MANUSCRIPT), consisted in the division or breaking up of the text into short sentences or lines according to the *sense*, with a view to a better understanding of the meaning and a better delivery in public reading. The Psalms, Proverbs and other poetical books were anciently thus written, and hence received the title of *βίβλοι στιχήρεις*, or *στιχηραί*; and it was on the same plan that St Jerome wrote, first the books of the prophets, and subsequently all the Bible of his version, *per cola et commata* "quod in Demosthene et Tullio solet fieri." In the Greek Testament also Euthalius, in the 5th century, introduced the method of writing *στιχηδόν*, as he termed it, into the Pauline and Catholic epistles and the Acts. The surviving MSS. which contain the text written in short sentences show by the diversity of the latter that the rhythmical sentences or lines of sense were differently calculated by different writers; but the original arrangement of St Jerome is thought to be represented in the Codex Amiatinus at Florence, and that of Euthalius in the Codex Claromontanus at Paris. With regard to St Jerome's reference to the division *per cola et commata* of the rhetorical works of Demosthenes and Cicero, it should be noticed that there are still in existence MSS. of works of the latter in which the text is thus written, one of them being a volume of the *Tusculans* and the *De senectute* in the Bibliothèque Nationale at Paris. The same arrangement of the text of the orations of Demosthenes is also mentioned by the rhetoricians of the 5th and subsequent centuries.

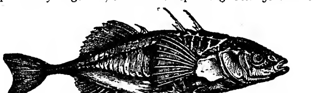
STICKÉ, a game played in an enclosed court, taking its name from "sphairistiké," the parent of lawn-tennis. The implements are an ordinary lawn-tennis racket and lawn-tennis balls not covered with flannel. The walls of the court may be made of wood, cement or brick to the height of 9 or 10 ft., with netting above—unless the court is roofed—to prevent the balls from going out: the floor may be of wood, cement or asphalt, perfect accuracy not being essential. The dimensions of the court are 78 ft. by 27 ft.; it is bisected longitudinally by a painted line, laterally by a net 3 ft. 6 in. high, above which is stretched a tape 8 ft. from the ground. In each of the corners a 9-ft. square (the "service" court) is painted, and 18 ft. from each back wall lines ("service" lines) are drawn across the breadth of the court. The rules are similar to those of lawn-tennis, except that a ball can only be "out of court" if it is struck over the walls.

STICK-INSECT, the name given to certain orthopterous insects of the family Phasmidae, of extremely variable form and size, and deriving their name from a resemblance to the branches and twigs of the trees in which they live and feed. The resemblance is produced by the great length and slenderness of the body and legs. Protection is afforded to some species, like *Heteropteryx grayi* from Borneo, by sharp thornlike spines. The anterior wings, when present, are always small; but the posterior wings are sometimes of large size and very beautifully coloured. The colouring, however, is only visible when the wings are expanded and in use. Many species are wingless at all ages. As in the leaf-insects, to which the stick-insects are closely allied, the egg-cases are very similar to seeds. Stick-insects are intolerant of cold, and attain their largest size and greatest profusion of species in the tropics, one West African species, *Palophus centaurus*, reaching a length of 9 in. Species of small size are found in southern Europe, one belonging to the genus *Bacillus* advancing as far north as the middle of France.

STICKLEBACK, the name applied to a group of small fishes (*Gastrosteus*) which inhabit the fresh and brackish waters as well as the coasts of the temperate zone of the northern hemisphere. As far as the European kinds are concerned, all may be met with in the brackish water of certain littoral districts. The majority have a compressed well-proportioned body, which in the marine species is of a more elongate form, leading to the allied group of flute-mouths (*Fistulariidae*), which are, in fact, gigantic marine sticklebacks. Their mouth is of moderate width, oblique, and armed with small but firmly set teeth. The head is almost entirely protected by hard bone; even the cheeks are cuirassed by the dilated infraorbital bones. There are no scales developed on any part of the body, but a series of hard and large scutes protects a greater or lesser portion of the sides. The first dorsal fin and the ventrals are transformed into pointed formidable spines, and joined to firm bony plates of the endoskeleton. With regard to the degree in which this armature is developed, not only do the species differ from each other, but almost every species shows an extraordinary amount of variation. About ten kinds may be taken to be specifically distinct.

So far as is known at present, all sticklebacks construct a nest for the reception of the spawn, which is jealously guarded by the male until the young are hatched, which event takes place in from ten to eighteen days after oviposition. He also protects them for the first few days of their existence.

Sticklebacks are short-lived animals; they are said to reach an age of only three or four years; yet their short life, at least that of the males, is full of excitement. During the first year of their existence, before the breeding season begins, they live in small companies in still pools or gently flowing brooks. But with the return of the warmer season each male selects a territory, which he fiercely defends against all comers, especially against intruders of his own species and sex, and to which he invites all females, until the nest is filled with ova. At this period he also assumes a bridal dress, painted with blue and red tints. The eggs are of comparatively large size, one female depositing from 50 to 100.



Gastrosteus aculeatus, var. *noveboracensis*, Three-Spined Stickleback.

Of the species known not one has so wide a geographical range, and has so well been studied, as the common British three-spined stickleback (*Gastrosteus aculeatus*). It is found everywhere in northern and central Europe, northern Asia, and North

America. The development of its scutes and spines varies exceedingly, and specimens may be found without any lateral scutes and with short spines, others with only a few scutes and moderately sized spines, and again others which possess a complete row of scutes from the head to the caudal fin, and in which the fin-spines are twice as long and strong as in other varieties. On the whole, the smooth varieties are more numerous in southern than in northern localities. This species swarms in some years in prodigious numbers; in Pennant's time amazing shoals appeared in the fens of Lincolnshire every seven or eight years. No instance of a similar increase of this fish has been observed in our time, and this possibly may be due to the diminished number of suitable breeding-places in consequence of the introduction of artificial drainage. This species usually constructs its nest on the bottom, excavating a hollow in which a bed of grass, rootlets or fibres is prepared; walls are then raised, and the whole is roofed over with the like material. The nest is an inch and more in diameter, with a small aperture for an entrance.

The ten-spined stickleback (*Gastrosteus pungitius*) is so called from the number of spines usually composing its first dorsal fin, which, however, may be sometimes reduced to eight or nine or increased to eleven. It is smaller than the three-spined species, rarely exceeding 2 in. in length. Its geographical range nearly coincides with that of the other species, but it is more locally distributed, and its range in northern Asia is not known. Its nest is generally placed among weeds above the bottom of the water. Breeding males are readily recognized at a distance by the intensely black colour of the lower parts of their body.

Both these species are extremely voracious. A small stickleback kept in an aquarium devoured, in five hours' time, 74 newly-hatched dace, which were about a quarter of an inch long. Two days after it swallowed 62 and would probably have eaten as many every day could they have been procured.

The sea-stickleback (*Gastrosteus spinachia* or *Spinachia vulgaris*) attains to a length of 7 in., and is armed with fifteen short spines on the back. It is extremely common round the British coasts, but never congregates in large shoals. At suitable localities of the coast which are sheltered from the waves and overgrown with seaweed, especially in rock-pools, one or two males establish themselves with their harems, and may be observed without difficulty, being quite as fearless as their fresh-water cousins. Harbours and shallows covered with *Zostera* are likewise favourite haunts of this species, although the water may be brackish. The nest is always firmly attached to sea-weed, and sometimes suspended from an over-hanging frond. The materials are bound together by a tough white thread which is formed by a secretion of the kidneys of the male. This species inhabits only the northern coasts of Europe.

STIER, RUDOLF EWALD (1800–1862), German Protestant divine and mystic, was born at Fraustadt in Posen on the 17th of March 1800. He studied at Halle and Berlin, first law and afterwards theology; and he continued his theological studies later at the pastoral seminary of Wittenberg. In 1824 he was made professor in the Missionary Institute at Basel. Afterwards he held pastorates at Frankleben near Merseburg (1829) and at Wichlinghausen in the Wupperthal (1838). In 1850 he was appointed superintendent at Schkeuditz, and in 1859 at Eisleben. He published a new edition of Luther's Catechism and a translation of the Bible based on that of Luther; but he is noted chiefly for his thoughtful, devotional and mystical commentary on the words of the Lord (*Reden des Herrn*, 3 vols., 1843; 3rd ed., 7 vols., 1870–1874; Eng. trans., 8 vols., 1855–1858; 3 vols., 1869). He died at Eisleben on the 16th of December 1862.

His other works, besides commentaries on the Psalms, Second Isaiah, Proverbs, Ephesians, Hebrews, Epistles of James and Jude, include: *Die Reden der Apostel* (2 vols., 1824–1830; Eng. trans., 1869) and *Die Reden der Engel in der heiligen Schrift* (1862). Cf. J. P. Lacroix, *The Life of R. Stier* (New York, 1874).

STIFTER, ADALBERT (1805–1868), Austrian author, was born at Oberplan in Bohemia on the 23rd of October 1805, the son of a linen weaver. Having studied at the university of Vienna, he became tutor to Richard, eldest son of Prince Metternich, and obtained in 1849 the appointment as school inspector with the title of *Schulrat* in Linz, where he lived until his death on the 28th of January 1868. As early as 1840 Stifter had made his name known by his *Feldblumen*, a collection of charming little sketches, but his fame chiefly rests upon his *Studien* (1844–1851) in which he gathered together his early writings. These sketches of scenery and rural life are among the best and purest examples of German prose. Among other of his works may be cited *Bunte Steine* (1853), *Nachsommer* (1857), *Witiko* (1864–1867), and *Briefe*, which appeared posthumously in 1869.

Stifter's *Sämtliche Werke* were published in 17 vols. in 1870. There are also editions of selected works in 4 vols. (1887) and in 6 vols. (1899). A critical edition by A. Sauer is in preparation. Stifter's letters were published by J. Aprent in 3 vols. (1869). See E. Kuh, *Zwei Dichter Österreichs* (1872); K. Pröll, *A. Stifter, der Dichter des Böhmerwaldes* (Vortrag, 1891); J. K. Markus, *A. Stifter* (2nd ed., 1879); A. R. Hein, *A. Stifter* (1904); T. Klaiber, *A. Stifter* (1905); W. Kosch, *A. Stifter und die Romantik* (1905).

STIGAND (d. 1072), archbishop of Canterbury, is first mentioned in 1020. He was then chaplain to Canute and afterwards to his son, Harold Harefoot, and after the death of the former king appears to have acted as the chief adviser of his widow, Emma. In 1043 he was consecrated bishop of Elmham and in 1047 was translated to Winchester; he supported Earl Godwine in his quarrel with Edward the Confessor, and in 1052 arranged the peace between the earl and the king. In this year the archbishop of Canterbury, Robert of Jumièges, having been outlawed and driven from England, Stigand was appointed to the archbishopric; but, regarding Robert as the rightful archbishop, Pope Leo IX. and his two successors refused to recognize him. In 1058, however, Benedict X. gave him the pall, but this pope was deposed in the following year. Stigand is said by Norman writers to have crowned Harold in January 1066; but it is now probable that this ceremony was performed by Aldred, archbishop of York. Stigand submitted to William, and assisted at his coronation. But the Conqueror was anxious to get rid of him, although he took him in his train to Normandy in 1067. In 1070 he was deposed by the papal legates and was imprisoned at Winchester, where he died, probably on the 22nd of February 1072. Stigand was an avaricious man and a great pluralist, holding the bishopric of Winchester after he became archbishop of Canterbury, in addition to several abbeys.

See E. A. Freeman, *The Norman Conquest* (1870–1876), vols. ii., iii. and iv.; and J. R. Green, *The Conquest of England* (1899), vol. ii.

STIGMATIZATION, the infliction of *stigmata*, *i.e.* marks tattooed or branded on the person, the term being used with specific reference to the supposed supernatural infliction of wounds like those of Christ.

An ancient and widespread method of showing tribal connexion, or relation to tribal deities, was by marks set upon the person; thus Herodotus, in describing a temple of Hercules in Egypt (ii. 113), says that it is not lawful to capture runaway slaves who take refuge therein if they receive certain marks on their bodies, devoting them to the deity. The practice is alluded to by Paul (Gal. vi. 17) in the words, "from henceforth let no man trouble me, for I bear branded on my body the stigmata of Jesus"; and some writers have understood the passage as referring to stigmatization in the modern sense (Molanus, *De historia ss. imaginum et picturarum*, ed. Paquot, iii. 43, p. 365). Branding, as indicative of servitude, was forbidden by Constantine.

In the period of persecution Christian martyrs were sometimes branded with the name of Christ on their foreheads (Pontius, "De vit. S. Cypriani," *Biblioth. veterum patrum*, vol. iii. p. 472, § vii.). Wounds of this sort were sometimes self-inflicted as a disfigurement by nuns for their protection, as in the case of St Ebba abbess of Coldingham (see Baronius, *Annales*, xv. 215, *ann.* 870, also Tert. *De vel. virg.*). Some Christians likewise marked themselves on the hands or arms with a cross or the name of Christ (Procopius, *In Esaiam*, ed. Curterius, p. 496), and other voluntary mutilations for Christ's sake are mentioned (Matt. xix. 12; Fortunatus, *Life of St Rhadegund*, ed. Migne, col. 508; Palladius, *Lausiac History*, cxii.; Jerome's *Letter to St Eustochium*, &c.).

In St Francis of Assisi we have the first example of the alleged miraculous infliction of stigmata. (For an earlier instance pronounced by the Church to be an imposture see Fleury, *Hist. Eccl.* lxxviii. § 56, *ann.* 1222.) While meditating on the sufferings of our Lord, in his cell on Mount Alverno in 1224, we are told by his biographers, Thomas of Celano and Bonaventura, that the Lord appeared to Francis as a seraph and produced upon his body the five wounds of Christ; of these we are told that the side wound bled occasionally, though Bonaventura calls it a scar, and the wounds in the feet had the appearance and colour of nails thrust through. After his death St Clare endeavoured, but in vain, to extract one of these. Pope Alexander IV. and other witnesses declared that they had seen these marks both before and after his death (Raynaldus, *ad ann.* 1255, p. 27). The divinely attested sanctity of their founder gave to the newly established order of Franciscans a powerful impulse, so that they soon equalled and threatened to overshadow in influence the previously founded order of St Dominic.

The reputation of the latter order was, however, similarly raised in the next century by the occurrence of the same wonder in the case of a sister of the third rule of St Dominic, Catherine Benincasa—better known as St Catherine of Siena. From her biographer's account we gather that she was subject to hystero-epileptic attacks, in one of which, when she was twenty-three years old, she received the first stigma (see v. 230). In spite of her great reputation, and the number of attesting witnesses, this occurrence was not universally believed in. Pope Sixtus IV. published a bull in 1475 ordering, on pain of anathema, the erasure of stigmata from pictures of St Catherine, and prohibiting all expressions of belief in the occurrence. Pope Innocent VIII. similarly legislated " ne de caetero S. Catherina cum stigmatibus depingatur; neve de ejus stigmatibus fiat verbum, aut sermo, vel praedicatio ad tollendam omnem scandali occasionem " (see references in Raynaud, *De Stigmatisme*, cap. xi. 1665). In the years which followed cases of stigmatization occurred thick and fast—now a Franciscan, now a Dominican, very rarely a religieuse of another order, showing the marks. Altogether about ninety instances are on record, of which eighteen were males and seventy-two females. (There are about thirty other cases sometimes included in the catalogue, of which there are no particulars recorded.) Most of them occurred among residents in religious houses, after the austerities of Lent, usually on Good Friday, when the mind was intently fixed on our Lord's Passion; and the possibility of the reception of the marks was constantly before the eyes and thoughts of the members of the two orders to which St Francis and St Catherine belonged. The order of infliction in the majority of cases was that of the crucifixion, the first token being a bloody sweat, followed by the coronation with thorns; afterwards the hand and foot wounds appear, that of the side being the last. The grade of the infliction varied in individual cases, and they may be grouped in the following series:—

1. As regards full stigmatization, with the visible production of the five wounds, and generally with the mark of the crown as well, the oldest case, after St Francis, is that of Ida of Louvain (1300), in whom the marks appeared as coloured circles; in Gertrude von Oosten of Delft (1344) they were coloured scars, and, as in the case of St Catherine, disappeared in answer to prayer as they also did on Dominica de Paradis; in Sister Pierona, a Franciscan, they were blackish grey. They were true wounds in Margaret Ebnerin of Nuremberg (d. 1351; see her *Life*, Augsburg, 1717), in Brigitta, a Dominican tertiary (1390), and also in Lidwina. An intermission is described in the marks on Johanna della Croce of Madrid (1524), in whom the wound in the side was large, and the others were rose-coloured circular patches. The marks appeared on each Friday and vanished on Sunday. These emitted an odour of violets; but in Sister Apollonia of Volaterra they were fetid while she lived. Angela della Pace (1634) was fully stigmatized at nine years of age, being even marked with the sponge and hyssop on the mouth; while Joanna de Jesu-Maria at Burgos (1613), a widow, who had entered the convent of Poor Clares, was marked in her sixtieth year. To her in vision two crowns were offered—one of flowers and one of thorns; she chose the latter and immediately was seized with violent pain and her confessor heard a sound as of her skull breaking. This case was investigated by the officers of the Inquisition. The stigmatization of Veronica Giuliani (1696) was also the subject of inquiry, and in this case the nun drew on a paper a representation of the images which she said were engraved on her heart. On a post-mortem examination being made in 1727 by Professor Gentili and Dr Bordiga, the image of the cross, the scourge, &c., were said to have been impressed on the right side of the organ (*Vita della Veronica Giuliana*, by Salvatori, Rome, 1803). The case of Christina Stumbelen, a Dominican at Cologne, is noteworthy, as on her skull there was found a raised ridge or crown which was at first green, with red dots. In Lucia di Narni (1546) the marks were variable, as they also were on Sister Maria di S. Dominico. On the body of St Margaret of Hungary the stigmata were found fresh and clear when her body was exhumed some time after her death for transportation to Presburg. Other stigmatized persons were Elizabeth von Spalbeck, a Cistercian; Sister Coleta, a Poor Clare; Matilda von Stanz; Margaret Bruch of Endringen (1503); Maria Razzi of Chios (1582); Catharina Januensis; Elizabeth Reith of Allgau; Stieva zu Hamm in Westphalia; Sister Mary of the Incarnation at Pontoise; Archangela Tardera in Sicily (1608); Catharina Ricci in Florence (1590); and Joanna Maria della Croce, a Poor Clare at Roveredo (d. 1673), upon whom the markings of the thorn crown and spear wound were especially deep.

2. In some cases, although the pains of stigmatization were felt, there were no marks apparent. This occurred to Helen Brumsen (1285); Helena of Hungary (1270); Osanna of Mantua (1476); Columba Rocasani; Magdalena de Pazzis; Anna of Vargas; Hieronyma Carvaglio; Maria of Lisbon, a Dominican; Joanna di Vercelli; Stephania Soncinas, a Franciscan; Sister Christina, a Carthusian; and Joanna Rodriguez, a Poor Clare. In the case of Ursula Aguir de Valenza, a tertiary of St Dominic (1608), and Catharine Cialina (d. 1619) the pain was chiefly that of the crown of thorns, as it was also in Amelia Bicchieri of Vercelli, an Augustinian.

3. In a third series some of the marks were visible on the body, while others were absent or only subjectively indicated by severe pains. The crown of thorns only was marked on the head of Vincentia Ferreria at Valencia (d. 1515) and Philippa de Santo Tomaso of Montemor (1670), while according to Torellus the Augustinian Ritta von Cassla (d. 1430) had a single thorn wound on the forehead. The crown was marked on Catharina of Raconizio (b. 1486), who also suffered a severe bloody sweat. In the case of Stephano Quinzani, in Soncino (1457), there was a profuse bloody sweat and the wounds were intermitting, appearing on Friday and Saturday, vanishing on Sunday. Blanche Gazinan, daughter of Count Arias de Sagavedra (1564), was marked only on the right foot, as also was Catherine, a Cistercian nun. The heart wound was visible in Christina Mirabilis (1232). Gabrielda de Piezolo (d. 1473) died from the bleeding of such a wound, and similar wounds were described in Maria de Acosrin in Toledo; Eustochia, a tertiary of St Francis; Clara de Bugny, a Dominican (1514); Cecilia Nobili, a Poor Clare of Nuceria (d. 1655). In the last instance the heart wound was found after death—a three-cornered puncture. A similar wound was seen in the heart of Martina de Arilla (d. 1644). Maria Villana, a Poor Clare, daughter of the margrave of La Pella, was marked with the crown and the spear thrust, and after her death the impresses of the spear, sponge and reed were found on her heart (d. 1670). The wound was usually on the left side, as in Sister Masrona of Grenoble, a tertiary of St Francis (1627); it was on the right in Margareta Columna, also a Clare. In Maria de Sarmiento it was said to have been inflicted by a seraph in a vision.

4. In a fourth set of cases the imprints were said to have been found on the heart, even though there was no surface marking. Thus the Dominican Paula de St Thomas was said to have had the stigmata on her heart. The heart of Clare of Montfaucon (1308) was said to have been as large as a child's head and impressed with the cross, the scourge and the nails. Similar appearances were found in Margaret of Citta di Capello and Johanna of Yepes (1591).

The instances of masculine stigmatization are few. Benedict di Rhegio, a Capuchin at Bologna, had the marks of the crown (1602); Carolus Sazia, an ignorant lay brother, had the wound in his side. Dodo, a Praemonstratensian lay brother, was fully stigmatized, as also was Philip de Aqueria. The marks after death were found on the heart of Angelos del Pas, a minorite of Perpignan, as also on Matheo Carery in Mantua, Melchior of Arazel in Valentia, Cherubin de Aviliana (an Augustinian), and Agolini of Milan. Walter of Strassburg, a preaching friar (1264), had the heart-pain but no mark, and the same was the case with a Franciscan, Robert de Malatestis (1430), and James Stephanus. On Nicholas of Ravenna the wounds were seen after death, while John Gray, a Scotsman, a Franciscan martyr, had one wound on his foot.

Several later instances have been recorded. Anna Katherina Emmerich, a peasant girl born at Münster in 1774, afterwards an Augustinian nun at Agnetenberg, was even more famous for her visions and revelations than for the stigmata. Biographies, with records of her visions, have been published by Brentano at Munich in 1852 and the Abbé Cazalès at Paris (1870). Colombe Schanolt of Bamberg (1787) was fully stigmatized, as also was Rose Serra, a Capuchin of Ozieri in Sardinia (1801), and Madeleine Lorger (1806). Two well-known cases occurred in Tirol—one "L'Ecstatica" Maria von Mörl of Caldaro, a girl of noble family, stigmatized in 1839, the other "L'Addolorata" Maria Dominica Lazzari, a miller's daughter at Capriana, stigmatized in 1835 (see Boré, *Les Stigmatisées du Tyrol*, Paris, 1846). A case of the second class is that of Elizabeth Eppinger of Niederbrunn in Bavaria (1814), reported on by Kuhn. An interesting example of stigmatic trance also occurred in the case of a Protestant young woman in Saxony in 1820, who appeared as if dead on Good Friday and Saturday, and revived on Easter Sunday.

The last case recorded is that of Louise Lateau, a peasant girl, at Bois de Haine, Hainault, upon whom the stigmata appeared on the 24th of April 1868. This case was investigated by Professor Lefebvre of Louvain, who for fifteen years was physician to two lunatic asylums. In her there was a periodic bleeding of the stigmata every Friday, and a frequent recurrence of the hystero-cataleptic condition. Her biography has been written by Lefebvre and published at Louvain (1870).

On surveying these ninety cases we may discount a certain number, including all those of the second class, as examples of subjective sensations suggested by the contemplation of the pains of crucifixion. A second set, of which the famous case of Jetzer (Wirz, *Helvetische Kirchengeschichte*, 1810, iii. 389) is a type, must be also set aside as obvious and intentional frauds produced on victims by designing persons. A third series, and how large a group we have not sufficient evidence to decide, we must regard as due to the irresponsible self-infliction of injuries by persons in the hystero-epileptic condition, those perverted states of nervous action which Charcot has done so much to elucidate. To any experienced in this form of disease, many of the phenomena described in the records of these examples are easily recognizable as characteristic of the hystero-epileptic state.

There are, however, some instances not easily explained, where the self-infliction hypothesis is not quite satisfactory. Parallel cases of physical effects due to mental suggestion are well authenticated. Beaunis vouches for rubefaction and vesication as produced by suggestion in the hypnotic state, and Bourru and Burot describe a case of bloody sweat, and red letters marked on the arm by simple tracing with the finger. See *Congrès scientifique de Grenoble, progrès médicale* (Aug. 29, 1885), and Berjon's *La Grande hystérie chez l'homme* (Paris, 1886). We know so little of the trophic action of the higher nerve centres that we cannot say how far tissue nutrition can be controlled in spots. That the nerve centres have a direct influence on local nutrition is, in some cases, capable of experimental demonstration, and, in another sphere, a few of the recorded instances of connexion between maternal impression and congenital deformity seem to indicate that this trophic influence may have wider limits and a more specific capacity of localization than at first sight seems possible.

STILBITE, a mineral of the zeolite group consisting of hydrated calcium aluminium silicate, $CaAl_2(SiO_3)_6+6H_2O$. Usually a small proportion of the calcium is replaced by sodium. Crystals are monoclinic, and are invariably twinned, giving rise to complex groups and characteristic sheaf-lide aggregates. The colour is usually white, sometimes red, and on the perfect cleavage (parallel to the plane of symmetry) the lustre is markedly pearly; hence the name stilbite given by R. J. Haüy in 1796, from Gr. στίλβειν, to shine. After the separation of heulandite from this species in 1818, the name desmine (from δέσμη, a bundle) was proposed, and this name is now employed in Germany. The hardness is 3½ and the specific gravity 2·2. Stilbite is a mineral of secondary origin, and occurs with other zeolites in the amygdaloidal cavities of basic volcanic rocks; it is sometimes found in granite and gneiss, and exceptionally in metalliferous veins. It is abundant in the volcanic rocks of Iceland, Faeroe Islands, Island of Skye, Bay of Fundy, in Nova Scotia and elsewhere. Beautiful, salmon-pink crystals occur with pale green apophyllite in the Deccan traps near Bombay and Poona; white sheaf-like groups encrust the calcite (Iceland-spar) of Berufjord near Djupivogr in Iceland; and crystals of a brick-red colour are found at Old Kilpatrick in Dumbartonshire. (L. J. S.)

STILE, a series of steps of stone or wood, or a combination of bars and steps used for passing over a fence or wall without the necessity of a permanent open passage or of opening or shutting a gate. The Old English, *stigel* is formed from *stigan*, to climb, ascend; stair (O. Eng. *staeger*) and stirrup are from the same root. Stile (Lat *stilus*, a pointed instrument) is really the correct spelling of style (*q.v.*)

STILES, EZRA (1727–1795), American clergyman and educationalist, seventh president of Yale College, was born on the 29th of November 1727 in North Haven, Connecticut, where his father, Isaac Stiles (d. 1760), was minister of the Congregational Church. He graduated at Yale in 1746; studied there for the three years following; was licensed to preach in 1749 and was a tutor at Yale in 1749–1755. He preached in 1750 to the Indians at Stockbridge, later studied law, was admitted to the bar in 1753, and practised in New Haven for two years. He was pastor of the Second Congregational Church of Newport, Rhode Island, from 1755 to 1777; in 1776–1777 he preached occasionally in Dighton, Massachusetts, whither he had removed his family after the British occupation of Newport; and in April 1777 he became pastor of the North Church of Portsmouth, New Hampshire. In 1778 he became president of Yale College and professor of ecclesiastical history there, having insisted that no theological statement be required of him except assent to the Saybrook platform of 1708; in 1780–1782 he was professor of divinity, and he lectured besides on astronomy and philosophy. He died in New Haven on the 12th of May 1795. His wise administration as president made possible the speedy recovery of Yale College after the War of Independence, and his intellectual and theological breadth helped to secularize and strengthen the college. As an undergraduate he became deeply interested in astronomy; he observed the comet of 1759 and the transit of Venus of June 1769, and left a quarto volume of astronomical notes. He experimented successfully with the electrical apparatus presented to Yale by Benjamin Franklin, whose intimate friend he became. He carefully kept thermometric and meteorological statistics; he imported silkworms and books on silk culture; he corresponded with many litterati—notably with Dr Nathaniel Lardner and with Sir William Jones, of whom he besought information of all kinds, but especially any that would lead to the discovery of the whereabouts of the ten lost tribes; and he undertook the study of Hebrew at the age of forty and became an able scholar. On Franklin's recommendation he was made a doctor of divinity by the university of Edinburgh in 1765; he had received a master's degree at Harvard in 1754. and was made doctor of divinity in 1780 by Dartmouth and in 1784 by the college of New Jersey (now Princeton University).

Dr Stiles published several sermons, notably, a *Discourse on the Christian Union* (1761), which has remarkable ecclesiastical breadth of view; an *Account of the Settlement of Bristol, Rhode Island* (1785); and a *History of Three of the Judges of King Charles I.: Major-General Whalley, Major-General Goffe and Colonel Dixwell* (1794). He began in 1768 but never finished an *Ecclesiastical History of New England and British America*. His *Literary Diary* was published in New York in 3 vols. in 1901, being edited by F. B. Dexter, who quotes largely from Dr Stiles's *Itineraries*, a daily account of his travels; the *Diary* gives a valuable picture of the life of New England in 1769–1795 and many interesting estimates of Stiles's contemporaries. See the *Life of Ezra Stiles* (Boston, 1798), by his daughter's husband, Abiel Holmes, the father of Oliver Wendell Holmes.

STILETTO (an Italian diminutive of *stilo*, dagger, Lat. *stilus*, a pointed instrument), a short stabbing dagger, the blade of which is either triangular or square in form. The term is also applied to a pointed bodkin of ivory, bone or metal used for making eyelet holes, &c.

STILICHO, FLAVIUS (?–408), Roman general and statesman, was the son of a Vandal who had served as an officer in the army of the emperor Valens (364–378). He himself entered the imperial army at an early age and speedily attained high promotion. He had already become master of the horse when in 383 he was sent by Theodosius (379–395) at the head of an embassy to the Persian king, Sapor III. His mission was very successful, and soon after his return he was made count of the domestics and received in marriage Serena, the emperor's niece and adopted daughter. In 385 he was appointed master of the soldiery (*magister militum*) in Thrace, and shortly afterwards directed energetic campaigns in Britain against Picts, Scots and Saxons, and along the Rhine against other barbarians. Stilicho and Serena were named guardians of the youthful Honorius when the latter was created joint emperor in 394 with special jurisdiction over Italy, Gaul, Britain, Spain and Africa, and Stilicho was even more closely allied to the imperial family in the following year by betrothing his daughter Maria to his ward and by receiving the dying injunctions of Theodosius to care for his children. Rivalry had already existed between Stilicho and Rufinus, the praetorian praefect of the East, who had exercised considerable influence over the emperor and who now was invested with the guardianship of Arcadius. Consequently in 395, after a successful campaign against the Germans on the Rhine, Stilicho marched to the east, nominally to expel the Goths and Huns from Thrace, but really with the design of displacing Rufinus, and by connivance with these same barbarians he procured the assassination of Rufinus at the close of the year, and thereby became virtual master of the empire. In 396 he fought in Greece against the Visigoths, but an arrangement was effected whereby their chieftain Alaric was appointed master of the soldiery in Illyricum (397). In 398 he quelled Gildo's revolt in Africa and married his daughter Maria to Honorius. Two years later he was consul. He thwarted the efforts of Alaric to seize lands in Italy by his victories at Pollentia and Verona in 402–3 and forced him to return to Illyricum, but was criticized for having withdrawn the imperial forces from Britain and Gaul to employ against the Goths. He manœuvred so skilfully in the campaign against Radagaisus, who led a large force of various Germanic peoples into Italy in 405, that he surrounded the barbarian chieftain on the rocks of Fiesole near Florence and starved him into surrender. Early in 408 he married his second daughter Thermantia to Honorius. It was rumoured about this time that Stilicho was plotting with Alaric and with Germans in Gaul and taking other treasonable steps in order to make his own son Eucherius emperor. There are conflicting accounts of the plots and counterplots and of the court intrigues, the relative truth of which will probably never be known. It is certain, however, that he was suspected by Honorius and abandoned by his own troops, and that he fled to Ravenna, and, having been induced by false promises to quit the church in which he had taken sanctuary, was assassinated on the 23rd of August 408.

The principal sources for the life of Stilicho are the histories of Zosimus and of Orosius and the flattering verses of Claudian. See T. Hodgkin, *Italy and her Invaders*, vols. i. and ii. (Oxford, 1880); E. Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury, vol. iii. (London, 1902); P. Villari, *The Barbarian Invasions of Italy*, translated by L. Villari, vol. i. (New York, 1902); S. Dill, *Roman Society in the last century of the Western Empire* (London, 1899). (C. H. Ha.)

STILL. (1) (O. Eng. *stille*, a word appearing in many Teutonic languages, all derived from the root, meaning to set in position or rest, seen in "stall," Ger. *stellen*, &c.), motionless, noiseless. or when used of wines or mineral waters, having little or no effervescence. As an adverb, "still" has preserved the original sense of "that which preserves its position," and thus means continually, permanently, now as before. (2) From the shortened form of "distil," Lat. *distillare*, to drip, trickle down, *stilla*, a drop, dim. of *stiria*. The older word for a "still" in English was *stillatory*, Medieval Latin *stillatorium*, an apparatus for heating substances and condensing the vapours (see Distillation and Spirits).

STILL, JOHN (*c.* 1543–1608), bishop of Bath and Wells, formerly reputed to be the author of *Gammer Gurton's Needle*, was born about 1543 at Grantham, Lincolnshire. He became a student of Christ's College, Cambridge, where he graduated B.A. in 1562, M.A. in 1565, and D.D. in 1575. In 1561 he became a fellow of his college and took holy orders. He was appointed in 1570 Lady Margaret professor of divinity, subsequently held livings in Suffolk and Yorkshire, and was master successively of St John's College (1574) and of Trinity College (1577). Still was vice-chancellor of his university in 1575–1576 and again in 1592–1593, and was raised to the bishopric of Bath and Wells in 1593. He died on the 26th of February 1608, leaving a large fortune from lead mines discovered in the Mendip Hills.

Gammer Gurton's Needle is the second extant English comedy, properly so called. Still, whose reputation as a serious churchman cannot be easily reconciled with the buffoonery of *A Ryght Pithy, Pleasaunt and merie Comedie: Intytuled Gammer Gurtons Nedle*, was first credited with its authorship by Isaac Reed in his edition (1782) of Baker's *Biographia dramatica*. The title-page of the piece, which was printed by Thomas Colwell in 1575, states that it was played not long ago at Christ's College, Cambridge, and was "made by Mr S. Mr of Art." A play was acted at Christmas 1567, and Still was chosen as being the only M.A. on the register at that time whose name began with S. There are reasons to suppose however that the play had been in Colwell's hands some time before it was printed, and it may well be identical with the *Dyccon of Bedlam* for which he took out a licence in 1562–1563, "Diccon the Bedlem" being the first of the dramatis personae of *Gammer Gurton*. In the accounts of Christ's College for 1559–1560 is the entry, "Spent at Mr Stevenson's plaie, 5s." William Stevenson was born at Hunwick, Durham, matriculated in 1546, took his M.A. degree in 1553, and became B.D. in 1560. Stevenson was a fellow of Christ's College from 1559 to 1561, and is perhaps to be identified with a William Stevenson who was a fellow from 1551 to 1554. If such is the case, there is reason to think that the composition of *Gammer Gurton's Needle* should be referred to the earlier period. He was made prebendary of Durham in 1560–1561, and died in 1575. Contemporary Puritan writers in the Marprelate tracts allude to Dr John Bridges, dean of Salisbury, author of *A Defence of the Government of the Church of England*, as the reputed author of *Gammer Gurton's Needle*, but he obviously could not be properly described as "Mr S." Dr Bridges took his M.A. degree at Pembroke College, Cambridge, in 1560, and the witty and sometimes coarse character of his acknowledged work makes it reasonable to suppose that he may have been a coadjutor of the author.

For the argument on behalf of William Stevenson's authorship, see Henry Bradley's essay prefixed to his edition of the play in *Representative English Comedies* (1903). The piece is also reprinted in Dodsley's *Old Plays* (vol. i., 1744; vol. ii., 1780); in *Ancient British Drama* (1810), vol. i.; and in J. M. Manly's *Specimens of the Pre-Shakspearean Drama* (Boston, U.S.A., 1897).

STILLICIDIUM, a dripping of water from the eaves (*stilla*, drop, *cadere*, to fall), the term in architecture given by Vitruvius (iv. 7) to the dripping eaves of the roof of the Etruscan temple.

Similar dripping eaves existed in most of the Greek Doric temples in contradistinction to the Ionic temples, where the water of the roof was collected in the cymatium or gutter and thrown out through the mouths of lions, whose heads were carved on the cymatium.

STILLINGFLEET, EDWARD (1635–1699), English divine, was born at Cranborne, Dorset, on the 17th of April 1635. There and at Ringwood he received his early education, and at the age of thirteen was entered at St John's College, Cambridge. He took his B.A. in 1652, and in the following year was elected to a fellowship. After residing as tutor first in the family of Sir Roger Burgoyne in Warwickshire and then with the Hon. Francis Pierrepoint at Nottingham, he was in 1657 presented by the former to the living of Sutton in Bedfordshire. Here he published (1659) his *Irenicum,* in which he sought to give expression to the prevailing weariness of the faction between Episcopacy and Presbyterianism, and to find some compromise in which all could conscientiously unite. He looks upon the form of church government as non-essential, but condemns Nonconformity. In 1662 (the year of the Act of Uniformity) he reprinted the *Irenicum* with an appendix, in which he sought to prove that "the church is a distinct society from the state, and has divers rights and privileges of its own." Stillingfleet's actions were as liberal as his opinions, and he aided more than one ejected minister. In later years he was not so liberal. But, though in 1680 he published his *Unreasonableness of Separation,* his willingness to serve on the ecclesiastical commission of 1689, and the interpretation he then proposed of the damnatory clauses of the Athanasian creed, are proof that to the end he leaned towards toleration. His rapid promotion dates from 1662, when he published *Origines sacrae, or a Rational Account of the Christian Faith as to the Truth and Divine Authority of the Scriptures and the Matters therein contained.* Humphrey Henchman, bishop of London, employed him to write a vindication of Laud's answer to John Fisher, the Jesuit. In 1665 the earl of Southampton presented him to St Andrew's, Holborn, two years later he became prebendary of St Paul's, in 1668 chaplain to Charles II., in 1670 canon residentiary, and in 1678 dean of St Paul's. He was also preacher at the Rolls Chapel and reader at the Temple. Finally he was consecrated bishop of Worcester on the 13th of October 1689. During these years he was ceaselessly engaged in controversy with Nonconformists, Romanists, Deists and Socinians. His unrivalled and various learning, his dialectical expertness, and his massive judgment, rendered him a formidable antagonist; but the respect entertained for him by his opponents was chiefly aroused by his recognized love of truth and superiority to personal considerations. He was one of the seven bishops who resisted the proposed Declaration of Indulgence (1688). The range of his learning is most clearly seen in his *Bishop's Right to Vote in Parliament in Cases Capital.* His *Origines Britannicae, or Antiquities of the British Church* (1685), is a strange mixture of critical and uncritical research. He was so handsome in person as to have earned the sobriquet of "the beauty of holiness." In his closing years he had some controversy with John Locke, whom he considered to have inpugned the doctrine of the Trinity. He died at Westminster on the 28th of March 1699, and was buried at Worcester. His manuscripts were bought by Robert Harley (afterwards earl of Oxford), his books by Narcissus Marsh, archbishop of Armagh.

A collected edition of his works, with life by Richard Bentley, was published in London (1710); and a useful edition of *The Doctrines and Practices of the Church of Rome Truly Represented* was published in 1845 by William Cunningham.

STILLMAN, WILLIAM JAMES (1828–1901), American painter and journalist, was born at Schenectady, New York, on the 1st of June 1828. His parents were Seventh-Day Baptists, and his early religious training influenced him all though his life. He was sent to school in New York by his mother, who made great sacrifices that he might get an education, and he graduated at Union College, Schenectady, in 1848. He studied art under Frederick E. Church and early in 1850 went to England, where he made the acquaintance of Ruskin, whose *Modern Painters* he had devoured, was introduced to Turner, for whose works he had unbounded admiration, and fell so much under the influence of Rossetti and Millais that on his return home in the same year he speedily became known as the "American Pre-Raphaelite." In 1852 Kossuth sent him on a fool's errand to Hungary to dig up crown jewels, which had been buried secretly during the insurrection of 1848–1849. While he was awaiting a projected rising in Milan, Stillman studied art under Yvon in Paris, and then, as the rising did not take place, he returned to the United States and devoted himself to landscape painting on Upper Saranac Lake in the Adirondacks and in New York City, where he started the *Crayon.* It numbered Lowell, Aldrich and Charles Eliot Norton among its contributors, and when it failed for want of funds, Stillman removed to Cambridge, Massachusetts. There he passed several years, but a fit of restlessness started him off once more to England. He renewed his friendship with Ruskin, and went with him to Switzerland to paint and draw in the Alps, where he worked so assiduously that his eyesight was affected. He then lived in Paris and was in Normandy in 1861 when the American Civil War broke out. He made more than one attempt to serve in the Northern ranks, but his health was too weak; in the same year he was appointed United States consul in Rome. In 1865 a dispute with his government led to his resignation, but immediately afterwards he was appointed to Crete, where, as an avowed champion of the Christians in the island and of Cretan independence, he was regarded with hostility both by the Mussulman population and by the Turkish authorities, and in September 1868 he resigned and went to Athens, where his first wife (a daughter of David Mack of Cambridge), worn out by the excitement of life in Crete, committed suicide. He was an editor of *Scribner's Magazine* for a short time and then went to London, where he lived with D. G. Rossetti. In 1871 he married a daughter of Michael Spartali, the Greek consul-general. When the insurrection of 1875 broke out in Herzegovina he went there as a correspondent of *The Times,* and his letters from the Balkans aroused so much interest that the British government was induced to lend its countenance to Montenegrin aspirations. In 1877–1883 he served as the correspondent of *The Times* at Athens; in 1886–1898 at Rome. He was a severe critic of Italian statesmen, and embroiled himself at various times with various politicians, from Crispi downwards. After his retirement he lived in Surrey, where he died on the 6th of July 1901. He wrote *The Cretan Insurrection of 1866–1868* (1874). *On the Track of Ulysses* (1888), *Billy and Hans* (1897) and *Francesco Crispi* (1899).

See his *Autobiography of a Journalist* (2 vols., Boston, 1901).

STILLWATER, a city and the county-seat of Washington county, Minnesota, U.S.A., at the head of Lake St Croix, on the west bank of the St Croix river, 20 m. above its mouth, and about 20 m. N.E. of St Paul. Pop. (1890) 11,260; (1900) 12,318; (1905 state census) 12,435, 3586 being foreign-born (1189 Swedes, 849 Germans, 828 Canadians); (1910 U.S. census) 10,198. It is served by the Northern Pacific, the Chicago, St Paul, Minneapolis & Omaha, and the Chicago, Milwaukee & St Paul railways, and is connected by electric line with St Paul and Minneapolis. The city is picturesquely situated on bluffs rising from the St Croix and commanding fine views. Among the public buildings are a handsome public library, the city hall, the county court-house, the Federal building, an auditorium, and the city hospital, and the city is the seat of the Stillwater business college, and of the Minnesota state prison, established in 1851, in which a system of parole and of graded diminution of sentences is in force, and in connexion with which is maintained a school and a library. Commercially Stillwater is important as a centre of the lumber trade and as a shipping point for cereal products. The valuable water-power is utilized by its varied manufactories. In 1905 the value of the factory products was $2,784,113 an increase of 54·6% since 1900. Stillwater, the first town platted in Minnesota, was permanently settled in 1843, and was laid out in 1848 by Joseph Renshaw Brown (1805–1870), a pioneer editor and soldier. Here met in 1848 the "Stillwater Convention," famous in Minnesota history as the first step in the erection of Minnesota Territory. Stillwater was chartered as a city in 1854. The first electric railway in the state was completed here in 1889, but failed later.

STILO PRAECONINUS, LUCIUS AELIUS, (*c.* 154–74 B.C.), of Lanuvium, the earliest Roman philologist, was a man of distinguished family and belonged to the equestrian order. He was called Stilo (*stilus*, pen), because he wrote speeches for others, and Praeconinus from his father's profession (*praeco*, public crier). His aristocratic sympathies were so strong that he voluntarily accompanied Q. Caecilius Metellus Numidicus into exile. At Rome he divided his time between teaching (although not as a professional schoolmaster) and literary work. His most famous pupils were Varro and Cicero, and amongst his friends were Coelius Antipater, the historian, and Lucilius, the satirist, who dedicated their works to him. According to Cicero, who expresses a poor opinion of his powers as an orator, Stilo was a follower of the Stoic school. Only a few fragments of his works remain. He wrote commentaries on the hymns of the Salii, and (probably) on the Twelve Tables; and investigated the genuineness of the Plautine comedies, of which he recognized 25, four more than were allowed by Varro. It is probable that he was the author of a general glossographical work, dealing with literary, historical and antiquarian questions. The rhetorical treatise *Ad Herennium* has been attributed to him by some modern scholars.

See Cicero, *Brutus*, 205–207, *De legibus*, ii. 23, 59; Suetonius, *De grammaticis*, 2; Gellius iii. 3, 1. 12; Quintilian, *Inst. orat.* x., 1, 99; monographs by J. van Heusde (1839) and F. Mentz (1888); Mommsen, *Hist. of Rome*, bk. iv. ch. 12, 13; J. E. Sandys, *History of Classical Scholarship* (2nd ed., 1906); M. Schanz, *Geschichte der römischen Literatur* (1898), vol. i.; Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), p. 148.

STILPO [STILPON], Greek philosopher of the Megarian school (*q.v.*), was a contemporary of Theophrastus and Crates. Intellectually in agreement with the Megarian dialectic, he followed the practical ethics of the Cynics both in theory and in practice. He extolled the Cynic ἀπαθεία (loosely, self-control) as the principal virtue. Cicero (*De fato*, 5) describes him as a man of the highest character. Suidas attributes twenty dialogues to him, but of these no fragments remain. Among his followers were Menedemus and Asclepiades, the leaders of the Eretrian school of philosophy. Seneca (*Epistle* 9) shows how closely allied Stilpo was to the Stoics (*q.v.*).

STILT, or LONG-LEGGED PLOVER, a bird so-called (see STILTS) for reasons obvious to anyone who has seen it, since, though not very much bigger than a snipe, the length of its legs (their bare part measuring 8 in.), in proportion to the size of its body exceeds that of any other bird's. The first name (a translation of the French *échasse*, given in 1760 by M J. Brisson) seems to have been bestowed by J. Rennie only in 1831; but, recommended by its definiteness and brevity, it has wholly supplanted the second and older one. The bird is the *Charadrius himantopus*[1] of Linnaeus, the *Himantopus candidus* or *melanopterus* of modern writers, and belongs to the group *Limicolae*, having been usually placed in the family *Scolopacidae*, though it might be quite as reasonably referred to the *Charadriidae*, and, with its allies to be immediately mentioned, would seem to be not very distant from *Haematopus*, notwithstanding the wonderful development of its legs and the slenderness of its bill.

The stilt obtains its food by wading in shallow water and seizing the insects that fly over or float upon its surface or the small crustaceans that swim beneath, for which purpose its slender extremities are, as might be expected, admirably adapted. Widely spread over Asia, North Africa, and Southern Europe, it has many times visited Britain—though always as a straggler, for it is not known to breed to the northward of the Danube valley—and its occurrence in Scotland (near Dumfries) was noticed by Sibbald so long ago as 1684. It chiefly resorts to pools or lakes with a margin of mud, on which it constructs a slight nest, banked round or just raised above the level so as to keep its eggs dry (*Ibis*, 1859, p. 360); but sometimes they are laid in a tuft of grass. They are four in number, and, except in size, closely resemble those of the oystercatcher (*q.v.*). The bird has the head, neck, and lower parts white, the back and wings glossy black, the irides red, and the bare part of the legs pink. In America the genus has two representatives, one[2]

(After Gosse.) FIG. 1.—Black-necked American Stilt.

(fig. 1) closely resembling that just described, but rather smaller and with a black crown and nape. This is *H. nigricollis* or *mexicanus*, and occurs from New England to the middle of South America, beyond which it is replaced by *H. brasiliensis*, which has the crown white. The stilt inhabiting India is now recognized to be *H. candidus*, but Australia possesses a distinct species, *H. novae-hollandiae*, which also occurs in New Zealand, though that country has in addition a species peculiar to it, *H. novaezelandiae*, differing from all the rest by assuming in the breeding-season an altogether black plumage. Australia, however, presents another form, which is the type of the genus *Cladorhynchus*, and differs from *Himantopus* both in its style of plumage (the male having a broad bay pectoral belt), in its shorter tarsi, and in having the toes (though, as in the stilt's feet, three in number on each foot) webbed.

Allied in many ways to the stilts, but differing in many undeniably generic characters, are the birds known as Avocets,[3] forming the genus *Recurvirostra* of Linnaeus. Their bill, which is perhaps the most slender to be seen in the whole class, curves upward towards the end, and has given the oldest known species two names which it formerly bore in England,—"cobbler's-awl," from its likeness to the tool so called, and "scooper," because it resembled the scoop with which mariners threw water on their sails. The legs, though long, are not extraordinarily so, and the feet, which are webbed, bear a small hind toe.

This species (fig. 2), the *R. avocetta* of ornithology, was of old time plentiful in England, though doubtless always restricted to certain localities. Charleton in 1668 says that when a boy he had shot not a few on the Severn, and Plot mentions it so as to lead one to suppose that in his time (1686) it bred in Staffordshire, while F. Willughby (1676) knew of it as being in winter on the eastern coast, and T. Pennant in 1769 found it in great numbers opposite to Fossdyke Wash in Lincolnshire, and described the birds as hovering over the sportsman's head like lapwings. In this district they were called "Yelpers" from their cry;[4] but whether that name was

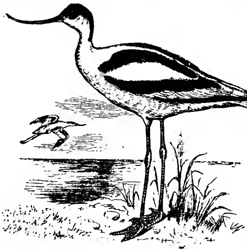
[1] The possible confusion by Pliny's transcribers of this word with *Haematopus* is referred to under OYSTERCATCHER. *Himantopus*, with its equivalent *Loripes*, "by an awkward metaphor," as remarked by Gilbert White, "implies that the legs are as slender and pliant as if cut out of a thong of leather."

[2] This species was made known to Ray by Sloane, who met with it in Jamaica, where in his day it was called "long-legs."

[3] This word is from the Bolognese *Avosetta*, which is considered to be derived from the Latin *avis*—the termination expressing a diminutive of a graceful or delicate kind, as *donnetta* from *donna* (Professor Salvadori *in epist.*).

[4] Cf. "yarwhelp" (see GODWIT) and "yaup" or "whaup" (see CURLEW). "Barker" and "clinker" seem to have been names used in Norfolk.

elsewhere applied is uncertain. At the end of the last century they frequented Romney Marsh in Kent, and in the first quarter of the present century they bred in various suitable spots in Suffolk and Norfolk—the last place known to have been inhabited by them being Salthouse, where the people made puddings of their eggs, while the birds were killed for the sake of their feathers, which were used in making artificial flies for fishing. The extirpation of this settlement took place between 1822 and 1825 (cf. Stevenson, *Birds of Norfolk*, ii. 240, 241). The avocet's mode of nesting is much like that of the stilt, and the eggs are hardly to be distinguished from those of the latter but by their larger size, the bird being about as big as a lapwing (*q.v.*), white, with the exception of its crown, the back of the neck, the inner scapulars, some of the wing-coverts and



(After Naumann.)

FIG. 2.—Avocet.

the primaries, which are black, while the legs are of a fine light blue. It seems to get its food by working its bill from side to side in shallow pools, and catching the small crustaceans or larvae of insects that may be swimming therein, but not, as has been stated, by sweeping the surface of the mud or sand—a process that would speedily destroy the delicate bill by friction. Two species of avocet, *R. americana* and *R. andina*, are found in the New World; the former, which ranges so far to the northward as the Saskatchewan, is distinguished by its light cinnamon-coloured head, neck and breast, and the latter, confined so far as known to the mountain lakes of Chile, has no white in the upper parts except the head and neck. Australia produces a fourth species, *R. novae-hollandiae* or *rubricollis*, with a chestnut head and neck; but the European *R. avocetta* extends over nearly the whole of middle and southern Asia as well as Africa. (A. N.)

STILTED, a term in architecture, given to anything raised above its usual level; it is usually applied to the arch, which is said to be stilted when its centre is raised above the capital or impost. In Byzantine architecture this was frequently done in order to give more importance to the twin arches of the windows, and less to the shaft which divided them. In Romanesque and Gothic work the stilted arch was often employed in the semicircular apses, where in consequence of the closer juxtaposition of the columns round the apse the arches were much narrower than those of the choir; in order, however, that the apex of all the arches should be of the same height, the apse arches were stilted.

STILTS, poles provided at a certain distance above the ground with steps or stirrups for the feet, for the purpose of walking on them. As a means of amusement stilts have been used by all peoples in all ages, as well as by the inhabitants of marshy or flooded districts. The city of Namur in Belgium, which formerly suffered from the overflowing of the rivers Sambre and Meuse, has been celebrated for its stilt-walkers for many centuries. Not only the towns-people but also the soldiers used stilts, and stilt-fights were indulged in, in which parties of a hundred or more attacked each other, the object being to overset as many of the enemy as possible. The governor of Namur having promised the archduke Albert (about 1600) a company of soldiers that should neither ride nor walk, sent a detachment on stilts, which so pleased the archduke that he conferred upon the city perpetual exemption from the beer-tax, no small privilege at that time.

The home of stilt-walking at the present day is the department of Landes in Gascony, where, owing to the impermeability of the subsoil, all low-lying districts are converted into marshes, compelling the shepherds, farmers and marketmen to spend the greater part of their lives on stilts. These are strapped to the leg below the knee, the foot resting in a stirrup about five feet from the ground. Their wearers, who are called *tchangues* (long-legs) in the Gascon dialect, also carry long staves, which are often provided with a narrow piece of board, used as a seat in case of fatigue. In the last quarter of the 19th century stilt-races, for women as well as men, became very popular in the Landes district, and still form an important feature of every provincial festivity. One winner of the annual championship races accomplished 490 kilometres (more than 304 m.) in 103 hours, 36 minutes. Silvain Dornon, a baker of the Landes, walked on stilts from Paris to Moscow in 58 days in the spring of 1891. The rapids of the Niagara have been waded on stilts. In many of the Pacific islands, particularly the Marquesas, stilts are used during the rainy season. Stilts used by children are very long, the upper half being held under the arms; they are not strapped to the leg. Stilts play an important part in the Italian masquerades, and are used for mounting the gigantic figures in the grotesque processions of Lisle, Dunkirk, Louvain and other cities.

STINDE, JULIUS (1841–1905), German author, was born at Kirchnüchel near Eutin on the 28th of August 1841, the son of a clergyman. Having attended the gymnasium at Eutin, he was apprenticed in 1858 to a chemist in Lübeck. He soon tired of the shop, and went to study chemistry at Kiel and Giessen where he proceeded to the degree of doctor of philosophy. In 1863 Stinde received an appointment as consulting chemist to a large industrial undertaking in Hamburg; but, becoming editor of the *Hamburger Gewerbeblatt*, he gradually transferred his energies to journalism. His earliest works were little comedies, dealing with Hamburg life, though he continued to make scientific contributions to various journals. In 1876 Stinde settled in Berlin and began the series of stories of the Buchholz family, vivid and humorous studies of Berlin middle-class life by which he is most widely known. He died at Olsberg near Kassel on the 7th of August 1905.

The first of the series *Buchholzens in Italien* (translated by H. F. Powell, 1887) appeared in 1883 and achieved an immense success. It was followed by *Die Familie Buchholz* in 1884 (translated by L. D. Schmitz, 1885); *Frau Buchholz im Orient* in 1888; *Frau Wilhelmine* (*Der Familie Buchholz letzter Teil*; translated by H. F. Powell, 1887) in 1886; *Wilhelmine Buchholz' Memoiren*, in 1894; and *Hotel Buchholz; Ausstellungserlebnisse der Frau Wilhelmine Buchholz*, in 1896. Under the pseudonyms of Alfred de Valmy, Wilhelmine Buchholz and Richard E. Ward, he also published various other works of more or less merit, among which his *Naturphilosophie* (1898) deserves special mention; his *Waldnovellen* (1881) have been translated into English.

STINK-WOOD, in botany, a South African tree, known botanically as *Ocotea bullata*, and a member of the family Laurineae. Other names for it are Cape Walnut, Stinkhout, Cape Laurel and Laurel wood. It derives its name from having a strong and unpleasant smell when fresh felled. It is used for building in South Africa and is described by Stone (*Timbers of Commerce*, p. 174) as "the most beautiful dark-coloured wood that I have yet met with." It is said to be a substitute for teak and equally durable. The wood is dark walnut or reddish brown to black with a yellow sap-wood, and the grain extremely fine, close, dense and smooth.

STIPEND, a fixed periodical payment or salary for services rendered. The word is particularly used of the income from an ecclesiastical benefice or of the salary paid to any minister of religion. In the United Kingdom a paid magistrate or justice of the peace, appointed by the Crown on the advice of the home secretary for certain boroughs are termed "stipendiaries" or "stipendiary magistrates" (see JUSTICE OF THE PEACE). The Latin *stipendium* (for *stipipendium*) is derived from *stips*, a gift, contribution (originally a heap of coins, *stipare*, to press; mass together) and *pendere*, to weigh out, pay. This was applied first to the pay of the army, and hence was used in the sense of military service, in such phrases as *stipendia facere*, and of a campaign, *e.g. vicena stipendia meritis* (Tac. *Ann.* i. 17). It also meant a tax or impost, payable in money.

STIRLING, MARY ANNE [Fanny] (1815–1895), English actress, was born in London, the daughter of a Captain Kehl. After some experience at outlying theatres, she appeared in London in 1836. Having been successful as Celia in *As You Like It* and Sophia in *The Road to Ruin*, Macready gave her an opportunity to play Cordelia to his Lear, and Madeline Weir to his James V. in the Rev. James White's *King of the Commons*. In 1852 she created Peg Woffington in Reade and Taylor's *Masks and Faces*. Meanwhile she had married Edward Stirling (d. 1894), an actor, manager and dramatic author. In later years Mrs Stirling gained a new popularity as the nurse in Irving's presentation (1882) of *Romeo and Juliet*, and again (1884) with Mary Anderson; and she was the Martha in Irving's production of *Faust* (1885). She died on the 30th of December 1895, having in the previous year married Sir Charles Hutton Gregory (1817–1898).

STIRLING, JAMES (1692–1770), Scottish mathematician, third son of Archibald Stirling of Garden, and grandson of Sir Archibald Stirling of Keir (Lord Garden, a lord of session), was born at Garden, Stirlingshire, in 1692. At eighteen years of age he went to Oxford, where, chiefly through the influence of the earl of Mar, he was nominated (1711) one of Bishop Warner's exhibitioners at Balliol. In 1715 he was expelled on account of his correspondence with members of the Keir and Garden families, who were noted Jacobites, and had been accessory to the " Gathering of the Brig o' Turk " in 1708. From Oxford he made his way to Venice, where he occupied himself as a professor of mathematics. In 1717 appeared his *Lineae tertii ordinis Newtonianae, sive* . . . (8vo, Oxford). While in Venice, also, he communicated, through Sir Isaac Newton, to the Royal Society a paper entitled " Methodus differentialis Newtoniana illustrata " (*Phil. Trans.*, 1718). Fearing assassination on account of having discovered a trade secret of the glass-makers of Venice, he returned with Newton's help to London about the year 1725. In London he remained for ten years, being most part of the time connected with an academy in Tower Street, and devoting his leisure to mathematics and correspondence with eminent mathematicians. In 1730 his most important work was published, the *Methodus differentialis, sive tractatus de summatione et interpolatione serierum infinitarum* (4to, London), which, it must be noted, is something more than an expansion of the paper of 1718. In 1735 he communicated to the Royal Society a paper " On the Figure of the Earth, and on the Variation of the Force of Gravity at its Surface." In the same year he was appointed manager for the Scots Mining Company at Leadhills. We are thus prepared to find that his next paper to the Royal Society was concerned, not with pure, but with applied science—" Description of a Machine to blow Fire by the Fall of Water " (*Phil. Trans.* 1745). His name is also connected with another practical undertaking, since grown to vast dimensions. The accounts of the city of Glasgow for 1752 show that the very first instalment of ten millions sterling spent in making Glasgow a seaport, viz. a sum of £28, 4s. 4d., was for a silver tea-kettle to be presented to "James Stirling, mathematician, for his service, pains, and trouble in surveying the river towards deepening it by locks." Stirling died in Edinburgh on the 5th of December 1770.

See W. Fraser, *The Stirlings of Keir, and their Family Papers*, (Edinburgh, 1858); " Modern History of Leadhills," in *Gentleman's Magazine* (June, 1853); Brewster, *Memoirs of Sir Isaac Newton*, ii. 300, 307, 411, 516; J. Nicol, *Vital Statistics of Glasgow* (1881–1885), p. 70; *Glasgow Herald* (Aug. 5, 1886).

Another edition of the *Lineae tertii ordinis* was published in Paris in 1797; another edition of the *Methodus differentialis* in London in 1764; and a translation of the latter into English by Halliday in London in 1749. A considerable collection of literary remains, consisting of papers, letters and two manuscript volumes of a treatise on weights and measures, are still preserved at Garden.

STIRLING, JAMES HUTCHISON (1820–1909), Scottish philosopher, was born at Glasgow on the 22nd of June 1820. He was educated at Glasgow University, where he studied medicine and philosophy. For a short time he practised as a doctor in Wales, but gave up his profession in order to continue his philosophical studies in Germany and France. From 1888 to 1890 he was Gifford lecturer at the university of Edinburgh and published his lectures in 1890 (*Philosophy and Theology*). He was an LL.D. of Edinburgh University, and foreign member of the Philosophical Society of Berlin. He died in March 1909. His principal works are: *The Secret of Hegel* (1865; new ed. 1893); *Sir William Hamilton: The Philosophy of Perception;* a translation of Schwegler's *Geschichte der Philosophie* (1867; 12th ed., 1893); *Jerrold, Tennyson and Macaulay*, &c. (1868); *On Materialism* (1868); *As Regards Protoplasm* (1869; 2nd ed., 1872); *Lectures on the Philosophy of Law* (1873); *Burns in Drama* (1878); *Text-Book to Kant* (1881); *Philosophy in the Poets; Darwinianism; Workmen and Work* (1894); *What is Thought? Or the Problem of Philosophy; By Way of a Conclusion So Far* (1900); *The Categories* (1903). Of these the most important is *The Secret of Hegel*, which is admitted, both in England and in Germany, to be among the most scholarly and valuable contributions to Hegelian doctrine and to modern philosophy in general. In the preface to the new edition he explains that he was first drawn to the study of Hegel by seeing the name in a review, and subsequently heard it mentioned with awe and reverence by two German students. He set himself at once to grapple with the difficulties and to unfold the principles of the Hegelian dialectic, and by his efforts he introduced an entirely new spirit into English philosophy. Closely connected with the *Secret* is the *Text-Book to Kant*, which comprises a translation of the *Critique* with notes and a biography. In these two works Dr Stirling endeavoured to establish an intimate connexion between Kant and Hegel, and even went so far as to maintain that Hegel's doctrine is merely the elucidation and crystallization of the Kantian system. " The secret of Hegel," he says in the preliminary notice to his great work, " may be indicated at shortest thus: Hegel made *explicit* the *concrete* universal that was *implicit* in Kant."

The sixth part of the *Secret* contains valuable criticisms on the Hegelian writings of Schwegler, Rosenkranz and Haym, and explains by contrast much that has been definitely stated in the preceding pages. Of Dr Stirling's other works the most important is the volume of Gifford Lectures, in which he developed a theory of natural theology in relation to philosophy as a whole. *As Regards Protoplasm* contains an attempted refutation of the *Essay on the Physical Basis of Life* by Huxley.

STIRLING, WILLIAM ALEXANDER, Earl of (*c.* 1567–1640), most generally known as Sir William Alexander, Scottish poet and statesman, son of Alexander Alexander of Menstrie (Clackmannanshire), was born at Menstrie House, near Stirling, about 1567. The family was old and claimed to be descended from Somerled, lord of the Isles, through John, lord of the Isles, who married Margaret, daughter of Robert II. William Alexander was probably educated at Stirling grammar school. There is a tradition that he was at Glasgow University; and, according to Drummond of Hawthornden, he was a student at the university of Leiden. He accompanied Archibald, 7th earl of Argyll, his neighbour at Castle Campbell, on his travels in France, Spain and Italy. He married, before 1604, Janet, daughter of Sir William Erskine, one of the Balgonie family. Introduced by Argyll at court, Alexander speedily gained the favour of James VI., whom he followed to England, where he became one of the gentlemen-extraordinary of prince Henry's chamber. For the prince he wrote his *Paraenesis to the Prince* . . . (1604), a poem in eight-lined stanzas on the familiar theme of princely duty. He was knighted in 1609. On the death of Henry in 1612, when he wrote an elegy on his young patron, he was appointed to the household of prince Charles. In 1613 he (in conjunction with Thomas Foulis and Paulo Pinto, a Portuguese) received from the king a grant of a silver-mine at Hilderston near Linlithgow, from which, however, neither the Crown nor the undertakers made any profit. In 1613 he began a correspondence with the poet Drummond of Hawthornden, which ripened into a lifelong intimacy after their meeting (March 1614) at Menstrie House, where Alexander was on one of his short annual visits. In 1614 Alexander was appointed to the English office of master of requests, and in July of the following year to a seat on the Scottish privy council. In 1621 he received from James I. enormous grants of land in America embracing the districts of Nova Scotia, New Brunswick, and the Gaspè Peninsula, accompanied by a charter appointing him hereditary lieutenant of the new colony. This territory was afterwards increased on paper, so as to include a great part of Canada. Alexander proceeded to recruit emigrants for his "New Scotland," but the terms he offered were so meagre that he failed to attract any except the lowest class. These were despatched in two vessels chartered for the purpose, and in 1625 he published an *Encouragement to Colonies* in which he vainly painted in glowing colours the natural advantages of the new territory. The enterprise was further discredited by the institution of an order of baronets of Nova Scotia, who were to receive grants of land, each 6 sq. m. in extent, in the colony for a consideration of £150. An attempt made by the French to make good their footing in the colony was frustrated (1627) by Captain Kertch, and Alexander's son and namesake made two expeditions to Nova Scotia. But Alexander found the colony a constant drain on his resources, and was unable to obtain from the treasury, in spite of royal support, £6000 which he demanded as compensation for his losses. He received, however, a grant of 1000 acres in Armagh. He was the king's secretary for Scotland from 1626 till his death, and in 1630 was created Viscount Stirling and Lord Alexander of Tullibody. In the same year he was appointed master of requests for Scotland, and in 1631 an extraordinary judge of the Court of Session. Meanwhile French influence had gained ground in America. In 1631 Charles sent instructions to Alexander to abandon Port Royale, and in the following year, by a treaty signed at St Germain-en-Laye, the whole of the territory of Nova Scotia was ceded to the French. Alexander continued to receive substantial marks of the royal favour. In 1631 he obtained a patent granting him the privilege of printing a translation of the *Psalms*, of which James I. was declared to be the author. There is reason to believe that in this unfortunate collection, which the Scottish and English churches refused to encourage, Alexander included some of his own work. He had been commanded by James to submit translations, when James was carrying out his long entertained wish to supplant the popular version of Sternhold and Hopkins; but these the royal critic had not preferred to his own. It has been assumed from the scanty evidence that when Alexander was entrusted with the editing and publishing of the *Psalms* by Charles I. he had introduced some of his own work. In 1633 he was advanced to the rank of earl, with the additional title of Viscount Canada, and in 1639 he became earl of Dovan. His affairs were still embarrassed and he had begun to build Argyll House at Stirling. In 1623 he received the right of a royalty on the copper coinage of Scotland, but this proved unproductive. He therefore secured for his fourth son the office of general of the Mint, and proceeded to issue small copper coins, known as "turners," which were put into circulation as equivalent to two farthings, although they were of the same weight as the old farthings. These coins were unpopular, and were reduced to their real value by the privy council in 1639. Alexander died in debt on the 12th of February 1640, at his London house in Covent Garden.

He was succeeded in the title by his grandson William, who died a few months later, and then by his son Henry (d. 1644), who became the 3rd earl. When Henry's grandson Henry, the 5th earl (1664–1739), died, the earldom became dormant, and in 1759 it was claimed by William Alexander (see below). In 1825 the earldom was claimed by Alexander Humphreys-Alexander, who asserted that his mother was a daughter of the first earl. The charter of 1639, however, on which his title rested, was declared in 1839 to be a forgery. See W. Turnbull, *Stirling Peerage Claim* (1839).

All Alexander's literary work was produced after 1603 and before his serious absorption in politics about 1614. The verse may be classed in three groups, (*a*) poetical miscellanies and minor verse, (*b*) dramas, (*c*) the heroic fragment on *Jonathan* and the long poem on *Doomesday*.

a. His earliest effort was *Aurora, containing the first fancies of the author's youth* (London, 1604), a miscellany of sonnets, songs and elegies, showing considerable formal felicity, if little originality, in the favourite themes of the Elizabethan sonneteers. To this may be added the *Paraenesis to Prince Henry* (*u.s.*), *An Elegie on the Death of Prince Henrie* (*u.s.*), and shorter pieces, including a sonnet to Michael Drayton, who had called Alexander "a man of men," and lines on the *Report of the Death of Drummond of Hawthornden*.

b. He wrote four tragedies, *Darius* (1603), *Croesus* (1604), *The Alexandraean* (1605), and *Julius Caesar* (1607). The first and second were published together in 1604 as the *Monarchicke Tragedies*, a title which was afterwards given by Alexander to a print of the four works in the editions of 1607 and 1616. They are didactic poems rather than plays, a sequence of reflections of the type of the *Falls of Princes*, the *Mirror for Magistrates*, or Lyndsay's *Dialog between Experience and a Courteour* (known also as the "Monarche"). It is very probable that the last suggested both motif and title. The pieces are dialogues rather than dramas: the choruses are of the "Moralitas" type of Renaissance verse rather than classical; and the varied versification is unsuitable for representation. Yet they contain not a few fine passages in the soliloquies, notably one in *Darius* (IV., iii.) on the vanishing of "Those golden palaces, those gorgeous halls" as "vapours in the air," which recall Shakespeare's later lines in the *Tempest*.

c. Of *Jonathan, an Heroicke Poeme intended*, only the first book (105 eight-lined stanzas) was written. *Doomesday*, or *The Great Day of the Lord's Judgement* (1614) is a dreary production in twelve books or "hours," extending to nearly 12,000 lines. It is written in eight-lined stanzas.

In addition to the pamphlet on Colonization, he wrote (1614) a continuation or "completion" to the third part of Sidney's *Arcadia*, which appears in the fourth and later editions of the Romance; and a short critical tract entitled *Anacrisis*, a "censure" of poets, ancient or modern.

A collected edition of his works appeared in his lifetime (1637) with the title *Recreations with the Muses* (folio). *Aurora* and the *Elegie* were not included. A complete modern reprint *The Poetical Works . . . now first collected and edited* (but without the editor's name on the title-page) was published in 3 vols. 8vo. in 1870 (Glasgow: Maurice Ogle & Co.).

His *Encouragement to Colonies* was edited for the Bannatyne Club by David Laing (1867), and by Edmund F. Slafter, in *Sir W. Alexander and Amer. Colonization* (Prince Society, Boston, Massachusetts, 1865). See also E. F. Slafter, *The Copper Coinage of the Earl of Stirling, 1632* (1874); *The Earl of Stirling's Register of Royal Letters relative to the Affairs of Scotland and Nova Scotia from 1615–1635* (ed. C. Rogers, with biographical introduction (1884–1885); C. Rogers, *Memorials of the Earl of Stirling* (1877); the introduction to the *Works* (1870) referred to above; the *Register of the Privy Council of Scotland, passim*; and the bibliography for William Drummond (*q.v.*) of Hawthornden. (A. B. G.; G. G. S.)

STIRLING, WILLIAM ALEXANDER, (titular) EARL OF (1726–1783), American soldier, was born in New York City. He was the son of James Alexander (1690–1756), at one time surveyor-general of New York and New Jersey, a noted colonial lawyer who was disbarred for a year for his conduct of the defence in the famous trial of John Peter Zenger. William served first as commissary and then as aide-de-camp to Governor William Shirley at the beginning of the French and Indian War, and in 1756 he accompanied Shirley to England, where he was persuaded to claim the earldom of Stirling (see above). In 1759 an Edinburgh jury declared him to be the nearest heir to the last earl of Stirling, and in 1761 he returned to America and assumed the title, although the House of Lords in 1762 forbade him to use it until he had proved his legal right. Soon after his return to America he settled at Basking Ridge, New Jersey, and became a member of the New Jersey Provincial Council and surveyor-general of the colony. Warmly espousing the colonial cause at the outbreak of the War of Independence, he was appointed in November 1775 colonel of the first regiment of continental troops raised in New Jersey, and in the following January distinguished himself by the capture of an armed British transport in New York Bay. In March he became brigadier-general, and for some time was in command at New York and supervised the fortification of the city and harbour. At the battle of Long Island he was taken prisoner, but was soon afterward exchanged, and in February 1777 became a major-general. He participated in the battles of Trenton, Princeton, Brandywine and Germantown, and especially distinguished himself at Monmouth. He took an active part in exposing the Conway Cabal, presided over the court-martial of General Charles Lee, and enjoyed the confidence of Washington to an unusual degree. In October 1781 he took command of the northern department at Albany to check an expected invasion from Canada. He died at Albany on the 15th of January 1783. He was a member of the board of governors of King's College (now Columbia University) and was himself devoted to the study of mathematics and astronomy.

See W. A. Duer, "Life of William Alexander, Earl of Stirling," in vol. ii. of the *Collections of the New Jersey Historical Society* (New York, 1847).

STIRLING, a royal, municipal and police burgh, river port and county town of Stirlingshire, Scotland. Pop. (1901), 18,697. It is finely situated on the right bank of the Forth, 39¾ m. N.W. of Edinburgh and 29½ m. N.E. of Glasgow, being served by the North British and the Caledonian railways. The old town occupies the slopes of a basaltic hill (420 ft. above the sea) terminating on the north and west in a sheer precipice. The modern quarters have been laid out on the level ground at the base, especially towards the south. Originally the town was protected on its vulnerable sides by a wall, of which remains still exist at the south end of the Black Walk. Formerly there were two main entrances—the South Port, 100 yds. to the west of the present line of Port Street, and the "auld brig" over the Forth to the north, a quaint high-pitched structure of four arches, now closed to traffic. It dates from the end of the 14th century and was once literally "the key to the Highlands." It still retains the gateway towers at both ends. Just below it is the new bridge erected in 1829 from designs by Robert Stevenson, and below this again the railway viaduct. According to local tradition, a bridge stood at Kildean, 1 m. up the river, not far from the field of the battle of Stirling Bridge (1297). The castle crowning the eminence is of unknown age, but from the time that Alexander I. died within its walls in 1124 till the union of the crowns in 1603 it was intimately associated with the fortunes of the Scottish monarchs. It is one of the fortresses appointed by the Act of Union to be kept in a state of repair, and is approached from the esplanade, on which stands the colossal statue of Robert Bruce, erected in 1877. The main gateway, built by James III., gives access to the lower and then to the upper square, on the south side of which stands the palace, begun by James V. (1540) and completed by Mary of Guise. The east side of the quadrangle is occupied by the parliament house, a Gothic building of the time of James III., now used as a barrack-room and stores. On the north side of the square is the chapel royal, founded by Alexander I., rebuilt in the 15th century and again in 1594 by James VI. (who was christened in it), and afterwards converted into an armoury and finally a store-room. Beyond the upper square is the small castle garden, partly destroyed by fire in 1856 but restored, in which William, 8th earl of Douglas, was murdered by James II. (1452). Just below the castle on the north-east is the path of Ballangeich, which is said to have given private access to the fortress, and from which James V. took his title of "Guidman of Ballangeich" when he roved incognito. Below it is Gowan Hill, and beyond this the Mote or Heading Hill, on which Murdoch Stuart, 2nd duke of Albany, his two sons, and his father-in-law the earl of Lennox, were beheaded in 1425. In the plain to the south-west were the King's Gardens, now under grass, with an octagonal turf-covered mound called the King's Knot in the centre. Farther south lies the King's Park, chiefly devoted to golf, cricket, football and curling, and containing also a race-course. On a hill of lower elevation than the castle and separated from the esplanade by a depression styled the Valley—the tilting-ground of former times—a cemetery has been laid out. Among its chief features are the Virgin Martyrs' Memorial, representing in white marble a guardian angel and the figures of Margaret M'Lauchlan and Margaret Wilson, who were drowned by the rising tide in Wigtown Bay for their fidelity to the Covenant (1685); the large pyramid to the memory of the Covenanters, and the Ladies' Rock, from which ladies viewed the jousts in the Valley. Adjoining the cemetery on the south is Greyfriars, the parish church, also called, since the Reformation (1656), when it was divided into two places of worship, the East and West churches. David I. is believed to have founded (about 1130) an earlier church on their site dedicated to the Holy Rood, or Cross, which was burned in 1406. The church was rebuilt soon afterwards and possibly some portions of the preceding structure were incorporated in the nave. The choir (the East church) was added in 1494 by James IV., and the apse a few years later by James Beaton, archbishop of St Andrews, or his nephew, Cardinal David Beaton. At the west stands the stately battlemented square tower, 90 ft. high. The nave (the West church), divided from the aisles by a double row of massive round pillars, is a transition between Romanesque and Gothic, with pointed windows. The crow-stepped Gothic gable of the south transept affords the main entrance to both churches. The choir is in the Decorated and Perpendicular styles and is higher than the nave. The parish church is 200 ft. long, 55 ft. broad and 50 ft. high. Within its walls Mary Queen of Scots was crowned in 1543, when nine months old, and in the same year the earl of Arran, regent of Scotland, abjured Protestantism; in 1544 an assembly of nobles appointed Mary of Guise queen-regent; on the 29th of July 1567 James VI. was crowned, John Knox preaching the sermon, and in August 1571 and June 1578 the general assembly of the Church of Scotland met. James Guthrie (1612–1661), the martyr, and Ebenezer Erskine (1680–1794), founder of the Scottish Secession Church, were two of the most distinguished ministers. To the south-west of the church is Cowane's Hospital, founded in 1639 by John Cowane, dean of gild, for twelve poor members of the gildry; but the deposition of the charity has been modified and the hall serves the purpose of a gildhall. Adjoining it is the military prison. Near the principal entrance to the esplanade stands Argyll's Lodging, erected about 1630 by the 1st earl of Stirling. On his death in 1640 it passed to the 1st marquess of Argyll and is now a military hospital. Broad Street contains the ruins of Mar's Work, the palace built by John Erskine, 1st (or 6th) earl of Mar, about 1570, according to tradition, out of the stones of Cambuskenneth Abbey; the old town house, erected in 1701 instead of that in which John Hamilton, the last Roman Catholic archbishop of St Andrews, was hanged for alleged complicity in the murders of Darnley and the regent Moray; the town cross, restored in 1891, and the house which was, as a mural tablet says, the "nursery of James VI. and his son Prince Henry." The important buildings include: the high school; the trades hall, founded by Robert Spittal, James IV.'s tailor, in the Back Walk; the burgh buildings, with a statue of Sir William Wallace over the porch; the National Bank, occupying the site of the Dominican monastery, founded in 1223 by Alexander II. and demolished at the Reformation; the Smith Institute, founded in 1873 by Thomas Stewart Smith, an artist, containing a picture-gallery, museum and reading-room; the public halls; the Royal Infirmary and various charitable institutions. Woollen manufactures (carpets, tartans, shawls) are the staple industry, and tanning, iron-founding, carriage-building and agricultural implement-making are also carried on, in addition to furniture factories, cooperage and rubber works. The harbour being accessible only at high water, and then merely to vessels of small tonnage, the shipping trade is inconsiderable.

Stirling is under the jurisdiction of a council with provost and bailies, and, along with Culross, Dunfermline, Inverkeithing and Queensferry (the Stirling burghs) returns a member to Parliament. The Abbey Craig, an outlying spur of the Ochils, 1½ m. north-east of Stirling, is a thickly-wooded hill (362 ft. high), on the top of which stands the Wallace monument (1869), a baronial tower, 220 ft. high, surmounted with an open-work crown. The Valhalla, or Hall of Heroes, contains busts of eminent Scotsmen. Cambuskenneth Abbey is situated on the left bank of the Forth, about 1 m. east-north-east of Stirling by ferry across the river. The name is derived from the Gaelic and means "the Crook of Kenneth," or Cairenachus. a friend of St Columba and patron of Kilkenny in Ireland. The abbey, which was in the Early Pointed style, was founded by David I. in 1147 for monks of the order of St Augustine. Several Scots parliaments met within its walls, notably that of 1326, the first attended by burgesses from the towns. At the Reformation Mary Queen of Scots bestowed it on the 1st earl of Mar (1562), who is said to have used the stones for his palace in Stirling. In 1709 the town council of Stirling purchased the land and ruins. All that remains of the abbey is the massive, four-storeyed tower—which is 70 ft. high, and 35 ft. square, and was painted and repaired in 1864—the graceful west doorway and the foundations of some of the walls. The bones of James III. and his queen, Margaret of Denmark, who were buried within the precincts, were discovered in 1864 and re-interred next year under a tomb erected by Queen Victoria at the high altar.

Earlier forms of the name of Stirling are Strivilen, Estriuelen, Striviling and Sterling, besides the Gaelic Struithla. It was known also as Snowdoun, which became the official title of the Scots heralds. The Romans had a station here (*Benobara*). In 1119 it was a royal burgh and under Alexander I. was one of the Court of Four Burghs (superseded under James III. by the Convention of Royal Burghs). In 1174 it was handed over to the English in security for the treaty of Falaise, being restored to the Scots by Richard I. The earliest known charter was that granted in 1226 by Alexander II., who made the castle a royal residence. The fortress was repeatedly besieged during the wars of the Scottish Independence. In 1304 it fell with the town to Edward I. The English held it for ten years, and it was in order to raise the Scottish siege in 1314 that Edward II. risked the battle at Bannockburn. Edward Baliol surrendered it in 1334 in terms of his compact with Edward III., but the Scots regained it in 1339. From this time till the collapse of Queen Mary's fortunes in 1568, Stirling almost shared with Edinburgh the rank and privileges of capital of the kingdom. It was the birthplace of James II. in 1430 and probably of James III. and James IV. In 1571 an attempt was made to surprise the castle by Mary's adherents, the regent Lennox being slain in the fray, and seven years later it was captured by James Douglas, 4th earl of Morton, after which a reconciliation took place between the Protestants and Roman Catholics. It was occupied in 1584 by the earls of Angus and Mar, the Protestant leaders, who, however, fled to England on the approach of the king. Next year they returned with a strong force and compelled James VI. to open the gates, his personal safety having been guaranteed. In 1504 Prince Henry was baptized in the chapel royal, which had been rebuilt on a larger scale. After the union of the crowns (1603) Stirling ceased to play a prominent part on the national stage. The privy council and court of session met in the town in 1637 on account of the disturbed state of Edinburgh. In 1641 Charles I. gave it its last governing charter, and four years afterwards parliament was held in Stirling on account of the plague in the capital, but the outbreak of the pest in Stirling caused the legislators to remove to Perth. During the Civil War the Covenanters held the town, to which the committees of church and state adjourned after Cromwell's victory at Dunbar (1650), but in August next year the castle was taken by General Monk. In 1715 the 3rd duke of Argyll held it to prevent the passage of the Forth by the Jacobites, and in 1746 it was ineffectually besieged by Prince Charles Edward. In 1773, in consequence of an intrigue on the part of three members of the council to retain themselves in office, the town was deprived of its corporate privileges, which were not restored until 1781.

See *History of the Chapel Royal, Stirling* (Grampian Club, 1882); *Charters of Stirling* (1884); John Jamieson, *Bell the Cat* (Stirling, 1902); *The Battle of Stirling Bridge—the Kildean Myth* (Stirling Natural History and Archaeological Society, 1905).

STIRLING-MAXWELL, SIR WILLIAM, Bart. (1818–1878), Scottish man of letters and virtuoso, the only son of Archibald Stirling of Keir, Perthshire, and of Elizabeth, third daughter of Sir John Maxwell, seventh baronet of Pollok, Renfrewshire, was born at Kenmure, near Glasgow, on the 8th of March, 1818. William Stirling was educated privately and at Trinity College, Cambridge, where he graduated in 1839. On leaving Cambridge he spent some years abroad, chiefly in Spain and Syria. Having succeeded his father as proprietor of Keir in 1847, when he was made vice-lieutenant of Perthshire, he in 1852 entered parliament as member for that county; and he was several times re-elected. On the death of his uncle in 1865 he succeeded to the baronetcy and estates of Pollok, assuming the additional name of Maxwell. In the same year he became deputy-lieutenant of Lanarkshire, and a like office was conferred on him in Renfrewshire in 1870. He married in 1865 Anna Maria, daughter of the 10th earl of Leven and Melville. She died in 1874, and in 1876 Sir William married Caroline Norton. In 1862 he was chosen lord rector of St Andrews, in 1872 the same honour was conferred by Edinburgh, and in 1876 he became chancellor of Glasgow. He was a trustee of the British Museum, of the National Gallery, and member of the senate of London University. In 1876 he was created a Knight of the Thistle, being the only commoner of the order. He died at Venice on the 15th of January 1878.

Sir W. Stirling-Maxwell's works, which are invariably characterized by thorough workmanship and excellent taste, were in some cases issued for private circulation only, and almost all of them are now exceedingly rare. They include an early volume of verse (*Songs of the Holy Land*, 1848), and several volumes containing costly reproductions of old engravings, along with valuable explanatory matter. His best-known publications are *Annals of the Artists of Spain* (1848), *The Cloister Life of Charles V.* (1852). Part of the *Annals* was revised and published as *Velasquez and his Works* (1855). The *Cloister Life* was at once recognized as a valuable contribution to history, but its importance was lessened by the appearance a year or two later of Mignet's *Charles-Quint* and L. P. Gachard's *Retraite et mort de Charles-Quint*. A life of *Don John of Austria*, from his posthumous papers, edited by Sir G. W. Cox, appeared in 1883. A collected edition of his works, with a short memoir, appeared in 1891.

STIRLINGSHIRE, a midland county of Scotland, bounded N. by Perthshire, N.E. by Clackmannanshire and the Firth of Forth, S.E. by Linlithgowshire, S. by Lanarkshire and the detached part of Dumbartonshire and S.W. and W. by Dumbartonshire; area 288,842 acres, or 451·3 sq. m. In the north-west a spur of the Grampians culminates in Ben Lomond (3192 ft.), and the centre is occupied by a group known as the Lennox Hills, consisting of Gargunnock Hills (1591), Fintry Hills (1676), Kilsyth Hills (1870), and Campsie Fells (1894). The chief river is the Forth, the windings of which constitute most of the northern boundary. The other important streams are the Carron, which rises in Campsie Fells and flows mainly east for 25 m. to the Forth of Grangemouth; the Endrick, which, rising in Fintry Hills, first flows east, then south and finally bends round to the west, a direction which it maintains for most of its course of 31 m. till it empties itself into Loch Lomond; the Kelvin, which, from its source in Kilsyth Hills, flows south-west to the Clyde at Glasgow after a run of 22 m., and the Avon, rising in the detached portion of Dumbartonshire, and flowing for 21 m. east and then north to the Forth. The principal lochs include the greater part of the eastern waters of Loch Lomond, from Endrick mouth to a point 2 m. north of Inversnaid; a small portion of the upper end of Loch Katrine, from a point in the centre of the lake opposite to Stronachlachar to Glengyle at the head; Loch Arklet, in the north-west area, 1 m. long by $\frac{1}{3}$ m. wide, forming part of the water supply of Glasgow; the small Loch Coulter, in the parish of St Ninians, and Black Loch, partly in Lanarkshire. The Forth and Clyde Canal crosses the south-eastern corner of the county from Grangemouth to Castlecary.

Geology.—The oldest rocks in the county are the Dalradian schists which occupy the north-west beyond a great fault which runs across from near the bottom end of Loch Lomond in a north-easterly direction passing not far from Aberfoyle. These schists are less altered and micaceous near the fault and there is some evidence for believing them to be of Ordovician age. On the south-eastern side of the fault are the conglomerates and sandstones of Lower Old Red Sandstone age, which are more highly inclined and coarser nearer the fault. Resting uniformly on the lower series is the Upper Old Red series of sandstones; but the junction between the two is faulted between Balfron and Kippen; the fault runs E.N.E.–W.S.W. Then follows the Carboniferous system which occupies the rest of the county. The lowest member, the Calciferous Sandstone group, consisting of clays and marls with cement nodules, may be seen on both sides of the Campsie Fells; it is well exposed near Strathblane in Ballagan Burn. These beds are succeeded by alternating beds of contemporaneous tuffs and sandstones and then by great sheets of diabase-porphyrite which attain a considerable thickness and form well-marked ridges on the southern side of the Campsie Hills; they are best developed north of Kilsyth and east of Fintry. Meikle Bin and Dungoil mark the sites of the vents from which some of these volcanic rocks were erupted. The Carboniferous Limestone series is the next in order and the lower beds may be found resting upon the volcanic rocks except where the junction is faulted and this series is let down, as it is between Strathblane and the Carron Water. As in the neighbouring counties, this series consists of a lower limestone group—with the Index, Calmy and Castle Cary limestones—a middle group with coals and clay ironstones and an upper limestone group with the Hosie and Hurlet limestones; below the latter is a bed of alum shale. These rocks are considerably folded about Kilsyth and in the directions of Banton and Cairnbeg; the "Riggin" near Kilsyth is a noteworthy example of an anticlinal fold. The next series is the Millstone Grit—sandstones with some coal-seams and fireclays—which occurs towards the eastern boundary. The true Coal-measures are well developed between Grangemouth and Stenhousemuir and about Falkirk. The more important seams are the Virtuewell (the highest), the Splint, Craw and Coxhead coals. Intrusive sheets of basalt have penetrated the Carboniferous rocks and are now quarried for road metal; Abbey Craig and Stirling Castle hill are formed of one of the more important of these intrusions. Later basalt dikes of Tertiary age are not uncommon. A good deal of boulder clay covers the older rocks and an interesting blue marine clay is found beneath it in the Endrick valley. The Carse of Stirling is overlaid by the muds and sands of the 50 ft. raised beach; and traces of the 100 ft. beach are also to be found.

Climate and Agriculture.—The rainfall for the year varies from 35 in. in the far east to 55 in. in the Highland region in the extreme north-west. The mean annual temperature is 47·5° F.; for January 38° F., for July 59° F. The arable soils are of two kinds, locally distinguished as "carse" and "dryfield," the rest of the land being composed of pasture, moor and peat. The "carse" extends along the valley from Buchlyvie to the eastern boundary, a distance of 32 m. (by the river), with a breadth of 1 to 4 m. The soil consists of the finest clays, without stones, but interspersed with strata of marine shells. It has been largely stripped of the overlying peat, and by draining, subsoil ploughing and the use of lime has been converted into a rich soil, especially adapted for wheat and beans. The "dryfield," mostly reclaimed since the beginning of the 18th century, occupies the valleys and the higher ground bordering the carse. It is fertile and well suited for potatoes and turnips. In the order of their importance the grain crops are oats, barley and wheat. Beans are also extensively grown. Livestock is raised in increasing numbers. The sheep are chiefly black-faced, the cattle Irish, shorthorns and cross-breeds. Ayrshires are the principal breed on the "dryfield" farms, where butter-making is largely carried on. Horses are kept only for farming operations or for stock, and a considerable number of pigs are reared. The average size of the holdings is from 70 to 80 acres. The area under wood is small. Birches grow naturally on the lower slopes of the mountains in Buchanan and Drymen, and oaks freely on the banks of Loch Lomond. Larch and Scots fir are the leading trees in modern plantations.

Other Industries.—The coalfield of the south-east supplies the staple industry. Iron ore, fireclay and oil-shale are also obtained, while limestone is extensively wrought in the Campsie district, and sandstone is quarried in many parts. The ironworks at Carron and Falkirk are important. Woollens are manufactured at Stirling and Bannockburn; calico-printing and bleaching are established in the south-west, especially at Lennoxtown, Strathblane and Milton. There are chemical works at Falkirk, Stirling, Denny and Lennoxtown. Throughout the county there are several breweries and distilleries, and at Grangemouth, the principal port, shipbuilding is carried on. The southern and south-eastern districts are served by the North British railway from Edinburgh to Glasgow (via Falkirk) and the Caledonian railway from Glasgow to Stirling (via Larbert), while branches connect Grangemouth, Denny and other places with the through-lines. The Forth & Clyde railway crosses the shire, mostly in the north, from Stirling to Balloch, and the North British also runs from Glasgow to Aberfoyle. In the tourist season there is a steamer service from Leith to Stirling (37 m.).

Population and Administration.—In 1891 the population numbered 118,021, and in 1901 it was 142,291, or 315 persons to the square mile, an increase for the decade exceeded only by the shires of Linlithgow and Lanark. In 1901 there were ten persons who spoke Gaelic only and 2014 Gaelic and English. The principal towns are Falkirk (pop. 29,380), Stirling (18,697), Grangemouth (8386), Kilsyth (7292), Stenhousemuir (5184), Denny and Dunipace (5158), Bridge of Allan (3240), and Bonnybridge (3009). The shire returns a member to parliament, and Stirling and Falkirk respectively belong to the Stirling and Falkirk district groups of parliamentary burghs. The police burghs include Falkirk, Grangemouth, Kilsyth, Denny and Dunipace and Bridge of Allan. The shire forms a sheriffdom with the counties of Dumbarton and Clackmannan, but there is a resident sheriff-substitute at Stirling and another at Falkirk. The shire is under schoolboard jursidiction, and there are secondary as well as science and art schools at Stirling and Falkirk. The town councils of Stirling and Kilsyth subsidize classes in science and art, besides manual instruction, and Denny and Dunipace maintains a mining instruction class.

History and Antiquities.—The wall of Antonius, built by Lollius Urbicus, in A.D. 142, connecting the Forth and Clyde, passed through the south-east of the county, in which it is locally known as Graham's Dyke. At Castlecary and Camelon, which were both stations of consequence on the line of the wall, many interesting relics have been found. The Camelon causeway, a Roman road, ran eastwards from Castlecary, crossed the rampart at Camelon, whence it proceeded northwards to Stirling and the Forth, where there was a station near the present bridge of Drip. Thence it crossed the river to Keir and Dunblane in Perthshire. To the north-east of the Carron foundry there stood, till its demolition in 1743, a fine circular Roman building called Arthur's Oon (oven), or Julius's Hof, but the two mounds in Dunipace parish supposed to have been raised as monuments of peace between the Romans and Caledonians are probably of natural origin. After the withdrawal of the Romans the county once more fell into the hands of the Picts, the original inhabitants, who, however, gradually retired before the advance of the Saxons and Scots. By the time of Malcolm Canmore (d. 1093) the lowland area had become settled, but the highland tract remained a disturbed and disturbing region until the pacification following the Jacobite rising of 1745–46. The county played a conspicuous part in the struggle for Scottish independence, being particularly associated with many of the exploits of Sir William Wallace and Robert Bruce. The three great battles of the independence were fought in the shire—Stirling Bridge (1297), Falkirk (1298), Bannockburn (1314). James III. was stabbed to death in a cottage in the village of Milton after the battle of Sauchieburn (1488), but apart from the disastrous defeat of the Covenanters at Kilsyth (1645) and the transitory triumph which Prince Charles Edward won at Falkirk (1746), the history of the shire practically centres in that of the county town.

STIRRUP (O. Eng. *stirap*, *stigrap*, M. Eng. *stirop*, *styrope*, &c., *i.e.* a mounting or climbing-rope; O. Eng. *stigan*, to mount, climb, and *rap*, rope, cf. Du. *stijbeugel*, literally mounting bow or loop, Ger. *Steigbügel*), a loop usually of metal, suspended by an adjustable strap from the saddle and used as a support for the foot of a rider of a horse when seated in the saddle and as an aid in mounting. The earliest use of stirrups seems to have been in the East, for they are mentioned in early Chinese literature and examples which must be earlier than the 7th century A.D. have been found in Japan. The Greeks and Romans did not use them but mounted by vaulting or from a mounting block (see SADDLERY AND HARNESS). The earliest evidence of their use in Europe is in the *Art of War* of the emperor Maurice (A.D. 582–602). They were probably brought into use by the nomad horsemen of Asia. The stirrup of the early middle ages seems to have been light and semicircular or triangular in shape. By the 14th century the footplate became broader and the sides heavier and ornamented. By the 16th century this ornamentation increases and open metal-work is used. The Arab stirrup is very large, affording a rest for the entire sole of the foot; sometimes the heel part projects and terminates in a sharp point used as a spur.

See the plates in F. Hotteuroth, *Trachten, Haus- Feld- und Kriegsgeräthschaften*, &c. (1901); and R. Zschille, *Die Steigbügel in ihrer Formen-Entwicklung* (1896).

STJERNHJELM, GEORG (1598–1672), Swedish poet and scholar, whose original name was Göran Lilja, was born at Wika in Dalecarlia on the 7th of August 1598. He took his degree at Greifswald, and spent some years in travelling over every quarter of Europe. On his return in 1626 he maintained a correspondence with Salmasius, Heinsius, and other scholars. He taught at Vesterås, and then at Stockholm, attracting the notice of Gustavus Adolphus, who gave him a responsible post at Dorpat in 1630, and raised him next year to the nobility. After the king's death, Christina attached him, as a kind of poet laureate, to her court in Stockholm. His property lay in Livonia, and when the Russians plundered that province in 1656 the poet, who was in temporary disgrace at court, was reduced to extreme poverty for two or three years. He subsequently became judge at Trondhjem, member of the council of war (1661), and president (1667) of the College of Antiquities at Stockholm. He died at Stockholm on the 22nd of April 1672. His greatest poem *Hercules*, is a didactic allegory in hexameters, written in very musical verse, and with almost Oriental splendour of phrase and imagery. The *Hercules*, which deals with the familiar story of the dispute for the hero between Duty and Pleasure, was first printed at Upsala in 1653 but was finished some years earlier. *Bröllops-Besvärs Ihugkommelse*, a sort of serio-comic epithalamium in the same measure, is another very brilliant work. His masques, *Then fångne Cupido* (Cupid Caught) (1649), *Freds-afl* (The Birth of Peace) (1649), and *Parnassus triumphans* (1651), were written for the entertainment of Queen Christina. He can scarcely be said to have been successful in his attempt, in the first two of these, to introduce unrhymed song-measures.

Stjernhjelm was an active philologist, and left a great number of works on language, of which only a few have been printed. He also wrote on history, mathematics, philosophy and natural science, producing original and valuable work on every subject he attempted. Among his numerous works are Letter A of the *Lexicon vocabulorum antiquorum gothicorum* (1643, &c.), *Archimedes reformatus* (1644), *Runa suetica* (Lübeck, 1700), and an edition of *Wäst Götha Lagbok* (1663). His works were partially edited by P. Hanselli (*Samlade vitterhets arbeten af Svenska Författare*, vol. i., 1871), by L. Hammarsköld (Stockholm, 1818), by F. Tamm (Upsala, 1891). See also C. J. Lénström, *Litterärt Porträttgalleri* (Upsala, 1838); there is a full list of his writings in the *Svenskt biographiskt Lexikon*, vol. xv. (Upsala, 1848).

STOA, the term in Greek architecture (Lat. *porticus*) given to a building, the roof of which is supported by one or more rows of columns, the stoai at Elis described by Pausanias being important examples.

STOBAEUS, JOANNES, so called from his native place Stobi in Macedonia, the compiler of a valuable series of extracts from Greek authors. Of his life nothing is known, but he probably belongs to the latter half of the 5th century A.D. From his silence in regard to Christian authors, it is inferred that he was not a Christian.

The extracts were intended by Stobaeus for his son Septimius, and were preceded by a letter briefly explaining the purpose of the work and giving a summary of the contents. From this summary (preserved in Photius's *Bibliotheca*) we learn that Stobaeus divided his work into four books and two volumes. In most of our MSS. the work is divided into three books, of which the first and second are generally called Ἐκλογαὶ φυσικαὶ καὶ ἠθικαί (Physical and Moral Extracts), and the third Ἀνθολόγιον (*Florilegium* or *Sermones*). As each of the four books is sometimes called Ἀνθολόγιον, it is probable that this name originally belonged to the entire work; the full title, as we know from Photius, was Ἐκλογῶν ἀποφθεγμάτων ὑποθηκῶν βιβλία τέτταρα (*Four Books of Extracts, Sayings and Precepts*). The modern arrangement is somewhat arbitrary and there are several marked discrepancies between it and the account given by Photius. The introduction to the whole work, treating of the value of philosophy and of philosophical sects, is lost, with the exception of the concluding portion; the second book is little more than a fragment, and the third and fourth have been amalgamated by altering the original sections. From these and other indications it seems probable that what we have is only an epitome of the original work, made by an anonymous Byzantine writer of much later date. The didactic aim of Stobaeus's work is apparent throughout. The first book teaches physics—in the wide sense which the Greeks assigned to this term—by means of extracts. It is often untrustworthy: Stobaeus betrays a tendency to confound the dogmas of the early Ionic philosophers, and he occasionally mixes up Platonism with Pythagoreanism. For part of this book and much of book ii. he depended on the works of Aëtius, a peripatetic philosopher, and Didymus. The third and fourth books, like the larger part of the second, treat of ethics; the third, of virtues and vices, in pairs; the fourth, of more general ethical and political subjects, frequently citing extracts to illustrate the pros and cons of a question in two successive chapters. In all, Stobaeus quotes more than five hundred writers, generally beginning with the poets, and then proceeding to the historians, orators, philosophers and physicians. It is to him that we owe many of our most important fragments of the dramatists, particularly of Euripides.

Editio princeps (1609); *Eclogae*, ed. T. Gaisford (1822), A. Meineke, (1860–1864); *Florilegium*, ed. T. Gaisford (1850); A. Meineke (1855–1857), C. Wachsmuth and O. Hense (1884–1894, and 1909).

STOCKBRIDGE, a township of Berkshire county, in western Massachusetts, U.S.A. Pop. (1900), 2081; (1910, U.S. census) 1933. It comprises an area of 24 sq. m. Lake Mahkeenac, or Stockbridge Bowl, is about 2 m. north of Stockbridge village. Immediately south of the village, in a cleft in the north-western part of Bear Mountain, is Ice Glen, with caverns ice-lined even in midsummer. In the southern part of the township, on the boundary of Great Barrington, is Monument Mountain (1710 ft.). Stockbridge village is on the Housatonic river, about 13 m. south by east of Pittsfield, and is served by the New York, New Haven & Hartford railway, and by an interurban electric line. It is well known as a summer resort, with a casino and golf links, a war monument, a bell tower erected by David Dudley Field to commemorate the Indian mission, a monument in the old burial ground of the Stockbridge Indians, a public library, and the Stockbridge Academy. Jonathan Edwards (commemorated by a monument, 1871) was the pastor (1750–1758), and wrote his *Freedom of the Will* here; the Sedgwick mansion, the home of Theodore Sedgwick (1746–1813), is at Stockbridge; his daughter, the author, Catherine M. Sedgwick, was born (and buried) here; and Stockbridge was the birthplace of Mark Hopkins and of Cyrus W. Field, who presented a park to the village. The "village improvement society" movement seems to have originated at Stockbridge in 1853. The Stockbridge (or Muh-he-kan-ne-ok) Indians, survivors of the Mohican tribe, removed to the Housatonic Valley from the west bank of the Hudson river soon after the first white settlements were made in New York; and in 1734 a mission was established among them in what is now the township of Great Barrington by John Sergeant (1710–1749), who translated part of the Bible into their language. In 1736 a town 6 m. square (including the present Stockbridge) was laid out for them. Lands were held in severalty, the Indians were guaranteed the civil rights of whites; they had a church (under the charge of Jonathan Edwards in 1750–1758), and a school. In 1739 their township was incorporated under the name of Stockbridge, possibly adopted because of a resemblance to the country about Stockbridge, England. Many of the Indians fought on the American side in the War of Independence. In 1783–1788 nearly all of them removed to the Brotherton settlement (established 1775), 14 m. south of what is now Utica, New York; there they built New Stockbridge. By 1829 nearly all had left New York for Wisconsin, settling near what is now South Kaukauna. By 1859 they had removed to the reservation in Shawano county, Wisconsin, where they now live.

See E. F. Jones, *Stockbridge Past and Present* (Springfield, 1854); and J. N. Davidson, *Muhhekaneok: a History of the Stockbridge Indians* (Milwaukee, 1863).

STOCK EXCHANGE, a market for the purchase and sale of all descriptions of negotiable securities (see MARKET). In the immense majority of cases the securities so dealt in are what are known as "stocks, bonds and shares," on which interest, or dividend, is payable when earned; but bills issued by governments and municipal corporations are also occasionally dealt in. Many years ago, when the British government was in the habit of issuing exchequer bills, a now obsolete form of security, these bills were quoted in the official list of the London Stock Exchange; this was possible because though nominally bills, they were really bonds with a variable rate of interest fixed half-yearly in advance by the treasury. The inconvenience of this arrangement led to their being abandoned as a portion of the system of British government finance. Markets for dealing in securities have existed for some hundreds of years. Their organization was loose, there was no specific body of persons forming the market, and there were no special rules governing their procedure until within the last hundred and fifty years.

London.—Previous to 1773 the London stockbrokers conducted their business in and about the Royal Exchange, but in that year, having formed themselves into an association under the designation of the Stock Exchange, they, after temporarily locating their headquarters in Sweeting Ally, Threadneedle Street, removed to Capel Court, Bartholomew Lane. The growth of business necessitating improved accommodation, a capital of £20,000 in four hundred shares of £50 each was raised in 1801 for the purpose of erecting a new building in Capel Court, which was finished and occupied in the following year, the members at that date numbering about five hundred. With the occupation of the new building new rules came into force; all future members were admitted by ballot, while both members and their authorized clerks were required to pay a subscription of ten guineas each. As only the wealthier members of the association had provided the capital for the new building, the Stock Exchange henceforth consisted of two distinct bodies—proprietors and subscribers. In 1854 the membership having increased to about one thousand persons, an extension of the premises in Capel Court was effected at a cost of £16,000. A very extensive increase in the accommodation was made in 1885, when what was for many years afterwards known as the "new house" was erected. It occupies by far the greater portion of the triangular area of which Throgmorton Street, Bartholomew Lane, part of Threadneedle Street and part of Old Broad Street form the sides. Sections of the external parts of this area are in the hands of banks, insurance companies and other places of business, but most of the south side of Throgmorton Street and most of the north side of that portion of Old Broad Street which lies between Throgmorton Street and Threadneedle Street are Stock Exchange premises. Since 1885 various alterations in the use of the space available have been made, but there has been no considerable extension to the building. A portion of the share and loan department occupies premises in Austin Friars.

The Managers, the Members and Committee.

The Stock Exchange site and buildings are the property of the holders of the share capital in the company called the Stock Exchange (Limited), which is under the control of nine "trustees and managers," who are appointed by the shareholders. There are now 20,000 shares of unlimited amount on which £12 has been paid up; no one person may hold more than 200 shares, and only members of the Stock Exchange can hold shares, except in the case of the representatives of proprietors who acquired their shares before the 31st of December 1875. When a proprietor dies his shares must be sold to a member within twelve months of his decease. As the dividends are handsome, there is rarely any difficulty in finding a buyer for such shares. The income of the company is derived from the annual subscriptions of members and their clerks, from entrance fees paid by new members, and from rents and investments.

The business and discipline of the Stock Exchange is under the control of the "committee for general purposes," shortly known as "the committee." This body is composed of thirty persons, and is elected annually. It is entirely distinct from the "managers." The committee, when called upon, settles disputes between members and sometimes between members and their clients. It does not move in any matter until this is brought to its notice, and even then it frequently declines to act. It does part of its work through sub-committees, but all questions are finally settled in full meeting. Its powers are very wide, ranging from the granting or refusing of a quotation to a new stock, to the expulsion of a member, and the suspension of a "special settlement," as well as such trifles as reprimanding young members overburdened with animal spirits, and the closing of the "house" for holidays other than those provided for by the rules. The committee has an enormous amount of routine work to do or superintend; the "official list" of prices and the marking of "business done," for which the share and loan department is responsible, is supervised by it; the "official assignees," who are appointed to deal with the assets of defaulting members, act under the orders of the committee.

Membership of the Stock Exchange is for twelve months only; everyone without exception who wishes to remain a member must be re-elected annually; the year ends on the 25th of March. New members may be elected, (*a*) by the nomination of a member who retires in favour of the new member, or of a former member, or of the legal personal representative of a deceased member. The candidate must be recommended by three members, who also become sureties for him during the first four years from the date of his admission for £500 each. (*b*) A certain number of admissions are made each year, without nomination, of candidates with two sureties; under this arrangement clerks who have completed four years' service are admitted.

Since the 23rd of November 1904, every member has been obliged to become the owner of at least one share in the Stock Exchange (Limited). This arrangement is the outcome of the long-standing controversy respecting the "dual management" of the Stock Exchange, the managers and the committee being, as already explained, independent authorities. The arrangement is, no doubt, anomalous, but it has worked efficiently. Its principal drawback is the fact that, as the managers are proprietors and represent the body of proprietors who were, and still are, a minority of the members, they may be unconsciously biased in favour of increasing the number of members, since the dividends on the Stock Exchange shares are derived from this source. In 1904 the number of members had become, temporarily, at any rate, too great, relatively to the business to be done by them, and it was decided to introduce the principle of limitation, not directly, but by the methods briefly described above. It is hoped that, if the shares are all gradually distributed among the members, the slight difference between the interests of the managers and the rest of the Stock Exchange will disappear. The plan adopted involves of course the difficulty that it may not be easy at all times for a candidate to obtain his qualifying shares except at a high price. The new system, however, appears to work well.

Jobbers and Brokers.

The London Stock Exchange is remarkable for having developed spontaneously a special mode of doing business, namely the differentiation of members into jobbers and brokers. A jobber is a member of the Stock Exchange who, according to the rules of that body, does business only with other members, as opposed to a broker who does business with the public as well as with his fellow members. Any member may at any time make known his intention to act as either jobber or broker, but he must not act as both simultaneously. The business of a jobber (who is sometimes called a dealer) is to be prepared to "make prices" and deal in certain classes of securities selected by himself, in which he causes it to be known that he is a jobber. He thus becomes a jobber in "the American market," or in the "South African market," or in the "Consols market"; or in any other market which he chooses. At the beginning of his career he usually has to rely for business on such friends as he has made in the house, while serving his time as a clerk to a broker; but if he shows ability for the work he soon becomes known to a wider circle and may eventually make for himself a position of considerable importance in the house. A jobber's method of doing business is simple in appearance. All he has to do is to remain in or near that portion of the Stock Exchange where other jobbers in the class of stocks he is concerned with congregate, during the greater part of the day, and wait for brokers to propose transactions to him. If he is in the Home Railways market and a broker tells him that he wants to deal in, say 1000 "Easterns," meaning Great Eastern ordinary, he replies that they are 80 to $80\frac{1}{4}$, or whatever the price is at the moment; this means that he will sell at the higher and buy at the lower of these prices the amount of shares mentioned, not knowing "which way" the broker wishes to operate. On the latter saying that he will sell, or buy, as the case may be, the bargain is made, and is noted by both parties in memorandum books for completion at the next "settlement." The broker is understood to be, and usually is, acting for a client outside the house, and is paid for his trouble by a brokerage fixed by rules and paid by the client. The jobber's profit consists in the "turn," that is, the difference between the two prices quoted. But it is obvious that the realization of this profit by the jobber depends on his being able to effect a counter-sale, or purchase, with some other broker in 1000 "Easterns," and it is in so fixing the prices he quotes that, on the average of the day's or fortnight's transactions, his book shows a balance on the right side that his ability is displayed. If he has sold the stock and has not got it on his books already, he must procure it by the next settlement in order to deliver it; if he cannot procure it he must borrow it (backwardation). If he has bought it he must pay for it by the next settlement, and should it have gone down in the interval he will evidently have made nothing on the transaction, so far as that settlement is concerned; he will have the stock "on his book" and will have to carry it over (contango) and wait till someone wants to buy it of him in order to "undo" the bargain. If he is possessed of capital he may pay for and hold the stock until its price has risen considerably, but as a rule a jobber tries to make quick profits. A jobber is not obliged to make a price, and in times of serious trouble the weaker ones among them refuse to do so, or merely stay away. A jobber has another defence against the risk of making a bargain which he thinks he will not be able to "undo" promptly; he can quote a "wide" price, that is, he could quote for 1000 "Easterns" "$79\frac{1}{2}$-$80\frac{1}{2}$." a price no broker would be likely to deal at. The extent of a jobber's business depends on the reputation he has acquired. Good brokers, in their own as well as their client's interest, always "pick their man," especially in times of danger and difficulty. A broker may be acquainted with several men in a particular market any one of whom he considers quite safe to deal with in ordinary times, but he will be very careful whom he chooses to execute an order with, when, owing to money being dear, or for some other reason, markets are "bad." The usefulness of the jobber has from time to time been denied by critics, who have pointed out that in other stock exchanges no differentiation of members into brokers and jobbers has taken place. It has also been alleged that his "turn" is too easily earned, which is not true, and that it is often too large; as to the latter statement, it may safely be said that no jobber who habitually quoted prices which were too "wide" would get much business.

Dealings with "Outside" Parties.

Since 1900 a controversy has arisen as to the propriety of jobbers dealing direct with members of country stock exchanges, and of brokers dealing direct with financial houses known to have certain shares to sell. The difficulty as regards the latter chiefly affected the mining share market. It may be argued that both parties are wrong according to the letter of Stock Exchange law, but their action can be defended. The broker who goes for a particular share direct to a financial house (colloquially called "the shop") may get better terms for his client, and though he also gets a second commission for himself, provided he makes known this latter fact to the client, the transaction is an innocent one. The jobber's action in regard to provincial stock exchanges, known in Stock Exchange slang as "shunting" business, may be regarded as a rough compensatory operation for loss of business he may incur through the broker's desertion of him for the financial houses. The quarrel would not have arisen but for the great increase in the members of the Stock Exchange and the fact that business during and for some years after the South African War was insufficient to give a living to so many competitors for it.

Daily Procedure.

The hours of business on the Stock Exchange have varied little since the early days of the institution. They now begin at 11 a.m. and end at 3.30 p.m. on ordinary days except Saturday, but the house remains open until 4 p.m. On Saturdays the closing hour is 1.30. During the settlement (see Account) the house is kept open till 4.30 p.m. Bargains are "marked," that is, the prices at which they are "done" are recorded in the official list, between 11 a.m. and 3.30 p.m. on ordinary days, and 11 a.m. and 1 p.m. on Saturdays; the marking of a bargain is effected at the request of the broker who made it; whenever investment purchases are made a large proportion of them are usually marked, as brokers like to be able to show that they did the business at the price stated in the "contract note" sent to the client. The amount of trouble a broker takes for a client is not always realized. An investment order gives much more trouble to a broker than a speculative order. In the former case the broker after arranging the purchase or sale has to perform various operations before the whole transaction is complete. He has to procure transfer forms, get them properly signed and witnessed, obtain the certificates, if the security dealt in is registered stock or shares, or the bonds if the security is "to bearer." There may be delay in the delivery of securities bought for which he is not responsible, but for which he may be blamed by an inconsiderate client. In cases of serious and unreasonable delay a broker has the drastic remedy open to him of calling upon the officials of the "buying-in and selling-out department" to buy the stock at whatever price may be necessary, the other party, that is, the jobber with whom he dealt, paying any difference between the agreed price and the price at which the security was "bought-in." Inscribed stock may be bought in on the day following the day specified for delivery of it. Bearer securities not punctually delivered may, in some cases, be bought in on the day they were due for delivery. Similar rules apply to unreasonable delay in payment for securities sold, which may be ended by a demand that the stock shall be "sold out." These rules are intended for use in extreme cases, and are not often resorted to.

The Settlement.

Every bargain which a broker executes for a client is understood to be "for the account," unless otherwise specified; that is, the completion of the bargain is understood as intended to take place on the next "settling day." There are two settlements in securities generally, and one in consols and British government securities, India stock, &c., each month (see Account). The interval between two settlements varies from 12 days to 19 days, but the normal interval is 14 days, and the settlement is usually spoken of as "the fortnightly settlement" or "account." In most securities it would not be easy to deal "for money," that is, to obtain cash or stock on the day of the transaction; but this can always be done in consols and other British government securities; "money" bargains in these are sometimes very numerous. Of late the practice of dealing in consols for next ordinary (not consols) account has become fairly common, and is now recognized officially.

All bargains for sale or purchase of stock are supposed prima facie to be investments, that is, the form of contract is the same in all cases. But if a client has bought or sold speculatively he will when the settlement arrives either "close the account" by effecting a sale, or purchase, of the stock he has operated in, or he may request his broker to "carry over" the bargain or "continue" it until the next account. This operation may be repeated as often as the client chooses, provided the broker is ready to give the required facilities. But the broker is under no obligation to carry over, and in times of difficulty, when money is dear, or politics threatening, he would very likely decline to do so. Since about 1890 an increasing number of speculative transactions have been effected in a manner which disguises their real character; the security is, to all appearance, bought and paid for in the Stock Exchange, but the client has, as a matter of fact, obtained the money by "pawning" the security with a bank. For many years the relations between the Stock Exchange and the money market in its wider sense (see MARKET) have been becoming closer; banks now lend more freely than they used to, and on a wider range of securities; but they also lend more often direct to the holder of the securities borrowed on, and not through a member of the Stock Exchange. Formerly the usual practice of those banks which had considerable business with the Stock Exchange was to lend large sums on high-class stocks to wealthy brokers, who employed the money inside the house in carrying over the accounts of their clients, or to other brokers whom they trusted. This class of business is still very large, but clients are not now always satisfied to borrow through their brokers; they not infrequently go direct to banks and borrow from them. This practice has its inconveniences: formerly it was possible for the jobbers in all important markets on the Stock Exchange to form a good idea, by comparing notes at each settlement, of what the condition of the speculative account really was, but it is less easy to do so now, because so much stock is "pawned" with banks that the conclusions arrived at by the jobbers from examining only what they are carrying over themselves are liable to be falsified through their finding (*a*) that the account is either lighter than they expected, stock having been taken off the market temporarily by means of loans obtained from banks; or (*b*) that it is much heavier than they were prepared for, the banks having suddenly refused to lend any longer on a mass of stock they had hitherto been carrying. Banks are apt to be more capricious in their action as regards this class of business than the big "money brokers"; they cannot so well feel the pulse of the market, and are therefore liable to sudden fits of alarm, and also to hurried changes of policy on the part of their boards, which may be, and usually are, based on sound principles, but are not infrequently carried out without sufficient regard to the circumstances existing at the moment chosen for putting them in practice.

Speculative Bargains.

Speculative dealings sometimes take the form of "options." An option is a right to buy or sell a specified quantity of a specified security at a certain price, within a specified period; for this right a sum of cash is paid which is usually quoted as a percentage on the face value of the security. Having paid this sum the purchaser of the option watches the market during the period fixed; if a rise or fall sufficient to show a profit occurs he sells or buys an amount of the security equal to that bargained for in the option contract and informs the broker with whom he "did the option" that he "calls" the security from, or "puts" it on him. If no movement, or an insufficient movement, occurs in the price during the specified period, the "option" is "abandoned." This form of transaction is often a useful one for a business man, but attempts have been made to represent it as a "safe" way of making money on the ground that "risk is limited," and, as such, it has been recommended to inexperienced persons who are foolish enough to wish to speculate without comprehending the nature of speculation. Option dealings are neither more nor less "safe" than other speculative operations. Brokers who quote prices for an option always fix them at a level which will, on the average, make their own positions safe, and their clients, unless they are unusually acute and well informed, are not more likely to make exceptional, or any, profits than by the more usual speculative methods.

Options.

During recent years the volume of transactions in interest-bearing securities has grown enormously in all the great cities of the world. In London the membership of the Stock Exchange, the number of securities quoted in the official list, and the number of securities dealt in, have expanded greatly, and the markets in New York and Paris, especially the former, have acquired enhanced importance. The Berlin Bourse, the business of which was steadily growing during the 'eighties and early 'nineties, was checked in its expansion after 1896 by drastic legislation passed in July of that year against bargains for future delivery, and much of the business of German speculators has been done since then in other exchanges, especially London, Amsterdam and Brussels, but it has grown nevertheless, and if the existing restrictions are removed will grow more. Communication between the various great cities of the world is much closer than it was before the telephone came into use; what is known as arbitrage business having attained very large proportions. This class of business consists in watching closely the fluctuations in certain securities which are dealt in in two big markets, and simultaneously selling in one and buying in the other. Previous to 1884 and 1885 it was chiefly confined to operations between London and Paris, the difference in the times of London and New York having up till then prevented the growth of a similar business between those cities, as New York morning prices do not reach London till about 3·15 p.m., and the London Stock Exchange is shut at 4 p.m. But in London, about the middle of the 'eighties, the practice of staying in "the street," after the Stock Exchange was shut, to deal in "Americans," began to become common, though many old-fashioned brokers set their faces against it. It is worth noting that in most of the foreign cities there has always been a disposition to stay later than in London, where it was formerly the rule to cease business definitely at a more or less fixed hour. Since 1885 there has been more laxity in this respect, but it is not even yet the practice to do business in the evening. In Paris, dealing "on the boulevard" goes on intermittently in summer as late as 9 p.m. when trade is active.

The Growth of Stock Markets.

The market for mining shares had, up to about 1888, held a very small place in the business of the Stock Exchange, but the discovery of an extensive goldfield on the Witwatersrand in the Transvaal produced a great change. At first, although the transactions in the new group of securities were very large, and enormous sums of money were won and lost in them, the "Kaffir circus," as it was called, was regarded with contempt by the older *habitués* of the Stock Exchange, and it was not until the winter of 1894–1895, when the number of brokers engaged in the new market had become greater than those in any other, that special recognition was given to the mining department by a rule that the arrangements for carrying over bargains in mining shares should begin the day before the regular settlement commenced (see ACCOUNT). Even with these new facilities the Stock Exchange clearing house found it difficult to cope with the huge mass of work thrown on it in 1895, and once or twice it broke down temporarily. Much of the trouble to all concerned arose from the fact that mining shares, like nearly all securities dealt in in London, were "registered" and not "to bearer." The offices of the companies were naturally not equipped with the staffs that would have enabled them to furnish certificates promptly in the enormous quantities unexpectedly required: it must be remembered that the preparation of a certificate for 50 or 100 shares of £1 each is just as troublesome as the preparation of one for 500 or 1000. The new feature, which upset all calculations, was the extraordinary number of small speculative investors who bought and paid for their shares, very often to their subsequent regret. If the shares had been "to bearer," the work could have been done with comparative ease.

The Mining Market.

Another remarkable feature of the "boom," to use the slang which came into general use during the great speculative mania for South African shares in 1895, was the fact that of the 200 or 300 shares dealt in, less than a dozen were officially quoted

As a rule no quotation was asked for, though a "special settlement" was obtained. Most of the companies concerned had been registered under the laws of the then existing South African Republic. After the Jameson raid business in the South African market slackened somewhat, and there were few new "Kaffir" companies introduced; but the volume of mining transactions was kept up by the discovery of the Coolgardie goldfields of West Australia, which led to the creation of a great number of companies, whose shares were "introduced" in London from 1895 onwards. Very few of these also were, or are, quoted in the official list. A minor "boom" occurred in the winter of 1900–1901 in West African shares, but although it created a good deal of noise, it was not to be compared in magnitude to the South African and West Australian movements. The West African goldfields are expected by the best authorities to be very productive eventually, but are at present in an early stage of development.

Mining Shares not Quoted Officially.

Recent events have been very unfavourable to the South African market, which has ceased to attract the attention it met with before the South African War. Many jobbers have left it for other markets, and the volume of business in it is so small that the additional day granted for the settlement of bargains in mining shares is said by some to be no longer necessary. Though the older mining markets are comparatively quiet, some new ones have come into existence, especially that for Siberian, British Columbian and New Zealand properties. There has also been an attempt to establish a market for Egyptian securities, chiefly those of land and financial companies; an extraordinary speculation took place in Cairo during 1905–1906, and collapsed in the early part of 1907 with unfortunate results to those who financed it. In 1910 a rubber market became active.

Paris.—The Paris Bourse is an institution of enormous strength, but it plays a smaller part in international business than might be expected, owing to the deep-rooted conservatism and caution of the French people in money matters. It is true that they are liable to occasional outbursts of imprudence, such as led to the loss of great sums in the Panama Canal Company; but, as a rule, it is difficult to induce the average Frenchman to place his money in anything which he does not think a safe interest-yielding security under French law: he almost always wants to invest, not to speculate. In Great Britain and America the distinction between the two is too frequently forgotten. Since the Panama collapse in 1894 the French investor—that is, the bulk of the French nation—has been very prudent. The French have gone on saving money, and have been very difficult to satisfy in the matter of the securities offered to them. Appeals to patriotism have drawn from some French capitalists a considerable amount of money from time to time for Russian government loans, but these appeals were backed by assurances given by large banking institutions like the Crédit Lyonnais, the Comptoir d'Escompte, and the Société Générale, in addition to the Bank of France, that the interest was secure. As a rule, investments outside France are not popular with the French peasantry and middle classes; but there has always been a minority ready to speculate from time to time, besides the body of professional operators on the Bourse. The dimensions of this minority increased during the last eight or ten years of the 19th century, owing to the attractions presented by the South African goldfields. Operators and speculative investors in France were large holders of South African mining shares when the Boer War broke out in 1899, and though they sold them freely in consequence of the war, they did so with the intention of "coming in" again, and on more than one occasion made tentative purchases. The great banking firms and institutions of Paris have been occupied a good deal with the finances of Spain, Portugal, Egypt, Turkey and other minor countries. They are often large purchasers of British Treasury bills, which during the first two years of the South African War afforded an extraordinary opportunity to the investor, it being possible to buy them at prices yielding a rate equal to $3\frac{3}{4}$ % per annum during the currency of the bills.

The Paris Bourse exists in virtue of the decree of the 7th of October, 1890, to regulate the execution of article 90 of the Code du Commerce and of the law of the 28th of March 1885, on *marchés à terme*, as modified by the decree of the 29th of June 1898. *Agents de change*, who form the members of the official bourses in France, must be Frenchmen over twenty-five years of age, and must be in possession of civil and political rights. They are "nominated" by decrees countersigned by the minister of finance or the minister of commerce and industry. In a bourse possessing six or more *agents de change* a *parquet* may be formed, that is, a portion of the bourse may be railed off to which only *agents de change* have the right of entry, the rest of the bourse being known as the *coulisse*. A bourse provided with a *parquet* elects a *chambre syndicale*, or committee, composed of a syndic and members varying in number according to the number of *agents* in the bourse. The maximum, when there are over sixty *agents*, is eight. In Paris there were only sixty *agents de change* until 1898, but in that year the number was raised to seventy, owing to the volume of securities to be dealt with on the bourse having expanded considerably. The individual members are not, in law, responsible for any liabilities that may be incurred by fellow-members, but the practice is that the *chambre syndicale* meets the liabilities of any defaulting member. Each member owns what is called a *charge*, for which he has paid a sum varying from 1,500,000 fr. to 2,000,000 fr. (£60,000 to £80,000) to his predecessor by a private arrangement. In addition the new member must deposit 250,000 fr. (£10,000) as caution money, and 120,000 fr. (£4800) in the *caisse commune* of the *chambre syndicale*. The *agents de change* have a monopoly of many kinds of legal business; they have various privileges denied to the dealers in the *coulisse*, as, for instance, the right to sell or buy certain securities for cash, the *coulissiers* being allowed only to deal for delivery at the settlement. The securities dealt in by the *coulisse* are known as *valeurs en banque*, and the *coulisse* is often called the *marché en banque*. The *agents de change* are responsible for the production of the official price list of the bourse, but the *coulisse* also issues a list of its own. A much bigger business is done in the *coulisse* than in the *parquet*, the market for foreign securities being in their hands; many *coulissiers* are wealthy men.

All continental securities are "to bearer," and when it is desired to induce French capitalists to take an interest in British securities which are inscribed or registered, it has been found necessary to convert a part of the stocks into bearer bonds or shares. The fact that all securities are to bearer has led to special arrangements being made for guarding against the delivery of bonds to which the seller's title may be considered doubtful. A journal called the *Bulletin officiel des oppositions* is published by the *syndicat des agents de change*, giving the designations and numbers of securities which have been *frappés d'opposition*, that is, whose currency on the bourse is temporarily stopped, either because they have been stolen or for other reasons. It is always necessary, before taking delivery in London of foreign bonds, to look through this list to see whether the bonds in question are included in it. Settlement (*liquidation*) in Paris takes place twice a month; that at the end of the month lasts five days, and that in the middle of the month four days. French *rentes* are "settled" at the end of the month.

New York.—The New York Stock Exchange is a wealthy association consisting of members, who must be citizens of the United States, of twenty-one years of age or more. Their number cannot be increased except by the governing committee, which consists of the president, treasurer and secretary of the Stock Exchange, and forty members. There are twelve standing committees to deal with various departments of administration, the more important of these being the Admission, Arbitration and Clearing House committees.

Persons attain membership by election, or by transfer from a member who has died or resigned. Various dues and charges are payable by a new member. A member who is admitted by transfer pays an "initiation fee" of $2000 (£400). When a transfer is made the approval of the governing committee must be obtained before it can be completed. The person to whom the transfer is made pays a sum to the transferor for his "seat in the house," the amount of which is a matter of private arrangement; as much as $90,000 (£18,000) has been paid for a "seat" when business is active, but when it is quiet the price falls considerably below this. A member may transfer his seat to his son (if the committee approve) without charging anything for it; but in all cases the transferee pays the above-mentioned initiation fee of $2000.

The gratuity fund is an arrangement for providing for the families of deceased members. Every member on election pays $10 to this fund; when a member dies an assessment of $10 is levied on all other members, and the Stock Exchange hands over $10,000 (£2000) to the family of the deceased.

The New York Stock Exchange building is opened at 9.30 a.m., but business does not begin until 10 a.m. The daily session continues until 3 p.m. No transactions must be entered into before 10 a.m. or after 3 p.m. (with certain exceptions) under severe penalties. The object of this is to enable all members to feel secure that no business has been done except within the official period, during which they are prepared to watch the market or provide for its being watched. Loans of money or securities, that is, what is called in London contango and backwardation business, may be arranged after 3 p.m. This latter provision is a necessary result of the settling arrangements on the Exchange.

Daily Business.

Transactions may be: (*a*) for cash, in which case payment is made or stock delivered the same day; (*b*) "the regular way," *i.e.* the transaction is to be completed on the following day to that on which the bargain was made; (*c*) "three days," in this case the bargain must be carried out in three days; (*d*) in the case of options bargains may be made up to a limit of sixty days. If no time is specified when the bargain is made it is treated as being "regular way." It will be seen that these arrangements differ materially from those in London, Paris and Berlin, where business is done on the basis of fortnightly or, in the case of some classes of securities, monthly settlements. New York has a daily settlement for the bulk of its transactions.

All leading banking and finance houses in New York have one partner who is a member of the Stock Exchange and attends to the firm's stock business. All partnerships in which a member is interested must be disclosed to the governing committee, who have very wide disciplinary powers which they can use if anything is done which is contrary to the rules, or the spirit of the rules, of the Exchange.

The Exchange building is situated in Wall Street, and the Exchange is colloquially known as "Wall Street," just as the London Exchange is sometimes called "Throgmorton Street" or "Capel Court." It has in it accommodation including a telephone installation for each member and a large staff of messengers, &c., for their service. The Exchange has met in the past with difficulties of the same kind as have troubled the London Exchange. In 1898 it was found necessary to regulate the growth of direct dealings with provincial exchanges, which were held to constitute a breach of the rules relating to commissions. Dealing for "outside" exchanges of an irregular character was forbidden in 1896.

The New York Exchange is often the scene of gigantic speculative movements, and enormous sums are won and lost on it from time to time; but a huge investment business, or, at any rate, what is intended to be investment business, is done in Wall Street. Too frequently, however, the ideas of the purchaser as to what constitutes an investment are not very clear, and he finds that he has acquired a speculative article; this is inevitable in a country which still contains a good deal of dormant wealth which must sometimes be developed by new methods whose merits, when expressed in terms of capital expenditure, are not always as great as their enthusiastic authors imagined they would prove.

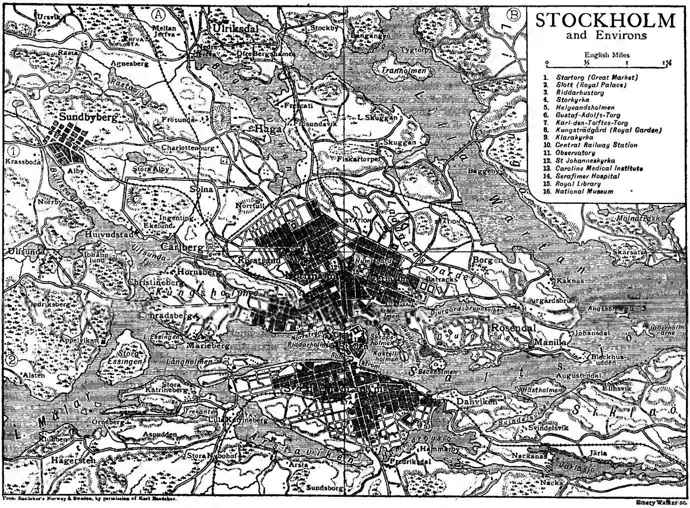
Berlin.—The business of the Berlin Börse is conducted under the strict regulations of the Imperial German law of the 22nd of June 1896, a measure which was intended to put a check on speculation in stocks and commodities in the supposed interests of the community. The term "Börse" is applied equally to the *Effectenbörse* (or *Fondsbörse*), that is, the "market for securities" (the Stock Exchange), and to the *Warenbörse* in which commodities are dealt in. "Börse" is, in fact, a term equivalent to "exchange" as used in the expressions "stock exchange," "corn exchange," "wool exchange," &c. The brokers (*Makler*) who carry on business at the Berlin Bourse are under the supervision of the *Ober-President* of the province of Brandenburg and the *Ober-President* of the city of Berlin, in accordance with the terms of the *Maklerordnung für die Kursmakler an der Berliner Börse,* which was issued in the form of a decree (Dec. 4, 1896) of the ministers of trade and industry.

The Bourse opens at 11.50 a.m. and closes at 3 p.m. for official dealings, and a quarter of an hour before and half an hour after those hours for "unofficial dealings." The unimportant part which the Berlin Bourse plays in the world of finance, owing to the legislative shackles with which it is loaded, has led to a movement in favour of a reform of the law, which would give more freedom to legitimate speculation in commodities as well as in securities. (W. Ho.)

STOCKHOLM, the capital of Sweden, on the east coast, not far south of the junction of the Baltic Sea and the Gulf of Bothnia. It is celebrated for the beauty and remarkable physical characteristics of its situation. The coast is here thickly fringed with islands (the *skärgård*), through which a main channel, the Saltsjö, penetrates from the open sea, which is nearly 40 m. from the mainland. A short stream with a fall normally so slight as to be sometimes reversed by the tide, drains the great lake Mälar into the Saltsjö. The scenery of both the lake and the *skärgård* is similar, the numerous islands low, rocky, and generally wooded, the waterways between them narrow and quiet. The city stands at the junction of the lake and the sea, occupying both shores and the small islands intervening. From the presence of these islands a fanciful appellation for this city is derived—"the Venice of the North"; but actually only a small part is insular. There are three main divisions, Staden, the ancient nucleus of the city, properly confined to Stadholmen (the city island) which divides the stream from Mälar into two arms, Norrström and Söderström; Norrmalm on the north shore of the channel, and Södermalm on the south.

Staden.

The ancient origin of Staden is apparent in the narrow and winding streets, though the individual houses are not very old, owing to the ravages of frequent fires. A few, however, preserve antique narrow fronts with gables, as in some of the North German towns. The old market, still called Stortorg (great market) is now one of the smallest in Stockholm. At the north angle of the island is the Royal Palace (*Slott*). The original building was destroyed by fire in 1697, the body of Charles XI. being with difficulty rescued from the flames. A new palace after designs of Nicodemus Tessin the younger (d. 1728) was not completed, owing to wars and the general distress, until 1754; while a restoration carried out in 1901 included many ornamental details devised by the architect, and executed at the expense of King Oscar II. The palace is quadrangular with two wings towards the east and four (two straight and two curving) towards the west. The style, that of the Italian Renaissance, is noble and refined, the royal apartments rich in treasures of art. In the north-east wing is a museum of armour and costume, one of the finest of the kind existing. West of the palace are the offices of the majority of the ministries, some of them in the former buildings of the Royal Mint. Beyond these, on the west side of the island, is a square named from the palace on its northern side, the Riddarhustorg. The Riddarhus (house of the nobility) was the meeting-place of the Council of the Nobles until 1866, and its hall is adorned with the armorial bearings of noble families. In the northern forecourt is a statue (1890) of Axel Oxenstjerna, the chancellor, by J. Börjeson. The town-hall is also in Riddarhustorg, and a statue of Gustavus Vasa, unveiled in 1773 on the 250th anniversary of his accession to the throne, stands here. South-west of



From Baedeker's Norway & Sweden, by permission of Karl Baedeker. Emery Walker sc.

the Royal Palace is the Storkyrka (great church), dedicated to St Nicholas, the oldest church of Stockholm, though greatly altered from its original state. The date of its foundation is 1264; but it was practically rebuilt in 1726–1743. Within it is richly adorned with paintings and wood-carving. Staden is the commercial centre of the city. At the broad shipping quay (*Skeppsbro*) which flanks the palace on the north and east, most of the sea-going steamers lie; and the exchange, custom-house, numerous banks and merchants' offices are in the immediate vicinity. Riddarholmen (nobles' island), lying immediately west of Stadholmen, contains the old Franciscan church (*Riddarholmskyrka*), no longer used for regular service, which since the time of Gustavus Adolphus has been the burial-place of the royal family. It contains many trophies of the European wars of Sweden. On one side of it stands the old house of parliament; on the other a statue of Birger Jarl, the reputed founder of the city. On Riddarholm also are various government offices, and most of the steamers for Mälar and the inland navigation lie alongside its quays.

Norrmalm.

Staden is connected with Norrmalm by the Norrbro (north bridge) and Vasabro, the first crossing Helgeandsholmen (the island of the Holy Spirit), on which are the new Houses of Parliament and the Bank of Sweden. A third bridge connects with the main thoroughfare of Norrmalm, Drottningsgatan (Queen Street). The Norrbro gives upon Gustaf-Adolfs-Torg, where a statue of that king stands between the royal theatre, royal opera house and the palace of the crown prince. Norrmalm is the finest quarter of the city, with broad straight streets, several open spaces with gardens, and handsome buildings. East and north of the theatre royal, the Karl-den-Tolftes-Torg and Kungsträdgård (royal garden) form the most favoured winter promenade. There are a statue of Charles XII. and a fountain with allegorical figures, by J. P. Molin, also a statue of Charles XIII., and in the small Berzelii Park close at hand one of the chemist J. J. Berzelius. Near Drottningsgatan is the Klara church, the burial-place of the poet K. M. Bellman, and west of this, occupying one side of a square, is the central railway station. In the building of the academy of science is the national museum of natural history, including mineralogical, zoological, and ethnographical departments. Drottningsgatan terminates at the observatory, on a rocky eminence, near which are the offices for the distribution of the Nobel fund. To the east the modern Gothic church of St Johannes, with a lofty spire, stands conspicuously on the Brunkebergsås, one of the highest points in the city. To the north is the small Vanad's Park. To the west is the modern quarter of Vasastad, with its park. On the island of Kungsholm, south of Vasastad, are the Caroline medical institute, several hospitals, the principal of which is the Serafimer (1752), the royal mint and factories. Östermalm, lying east, that is, on the seaward side, of Norrmalm, is a good residential quarter, containing no public buildings of note, save the barracks of the Swedish Guards and the fine royal library, which is entitled to receive a copy of every work printed in Sweden. The library stands in the beautiful park of Humlegård (hop-garden), in which is also a statue of Linnaeus. South of Östermalm, and east of the Kungsträdgård and Staden, lies the peninsula of Blasieholm (formerly an island) and, connected by bridges, the islands of Skeppsholm and Kastellholm, the three forming the foreground in the beautiful seaward view from the Norrbro. On the first is the national museum (1866), a Renaissance building, containing historical, numismatic and art-industrial collections, with ancient and modern sculptures, picture-gallery and engravings. The numismatic collection is notable for its series of Anglo-Saxon coins. About 11,000 pieces came from the island of Gotland, some dating from 901–924, but the majority are later. In front of the museum is a bronze cast of the famous group of J. P. Molin (1859), the Bältespännare (belt-bucklers), representing an early form of duel in Scandinavia, in which the combatants were bound together by their belts. On Skeppsholm are naval and military depots, and on Kastellholm a small citadel. East of Skeppsholm an inlet, Ladugårdslandsviken, so named from the proximity of the former royal farm-yard (*ladugård*), and bordered on the mainland by a quay with handsome houses called Strandvägen, throws off a narrow branch (Djurgårdsbrunnsviken) and separates from the mainland an island about 2 m. in length by $\frac{3}{4}$ m. broad. This is mainly occupied by Djurgården (the deer-park), a beautiful park containing the buildings of the northern museum, a collection of Scandinavian costumes and domestic and agricultural utensils, and a biological museum housed in a wooden building imitating the early Norwegian timber churches (*stavekirke*). Here also is Skansen, an ingenious reproduction in miniature of the salient physical features of Sweden with its flora, fauna, and characteristic dwellings inhabited by peasants in the picturesque costumes of the various districts. Both the northern museum and Skansen were founded by Dr Arthur Hazelius (1833–1901). There is a bust of the poet K. M. Bellman, whose festival is held on the 26th of July. Södermalm, the southern quarter, is principally residential. Rocky heights rise to 120 ft. above the water, and two steam lifts, Katarina-Hissen and Maria-Hissen, surmount them.

Environs.—The beautiful environment of sea and lake is fully appreciated by the inhabitants. To the north of the city, accessible by rail and water, are the residential suburbs of Haga and Ulriksdal, with royal *chateaux*, and Djursholm. Saltsjöbaden. 9 m. east of Stockholm, on Baggensfjörd, is the nearest and most favoured seaside resort, but Dalarö (20 m. south-east) and Nynäshamn (39 m. south) are much frequented. Vaxholm, 12 m. north-east by water, is a pleasant fishing-village where numerous villas have been built. A fortification on one of the islands here was erected by Gustavus Vasa, but has been modernized and is maintained.

Educational and Scientific Institutions.—Stockholm has no state university. A private university (*Hogskoler*) was founded in 1878, and was brought under state control in 1904. The president of the governing body is appointed by the government, while the appointment of the remaining members is shared by the Swedish Academy, the Academy of Sciences and the City Council. The faculties are four—philosophy and history, philology, mathematics and natural sciences, and jurisprudence. The Caroline Institute (*Karolinska Mediko-Kirurgiska Institut*) is a medical foundation dating from 1815, which ranks since 1874 with the state universities of Upsala and Lund in the right to hold examinations and confer degrees in its special faculty. Special and secondary education is highly developed; there are schools of agriculture, mining and forestry, military schools, technical schools, a veterinary school, a school of pharmacy, &c. Among the public colleges under state control, one, the Nya Elementarskolan, was founded experimentally in 1828, after the Education Committee of 1825–1828, among the members of which were Tegner and Berzelius, had reported on the want of such schools. This school retains its separate governing board; whereas others of the class are under a central board. The control of the primary schools in the parishes is similarly centralized; whereas in Sweden generally each parish has its school-board. Stockholm is the seat of the principal learned societies and royal academies (see SWEDEN). There are schools of painting, sculpture and architecture under the direction of the Royal Academy of Arts; a conservatory of music under that of the Royal Academy of Music; and experimental gardens and laboratories under the Royal Society of Agriculture. The Natural History Museum, the observatory and meteorological office, and the botanical gardens are under the supervision of the royal academy of sciences. Minor collections deserving mention are the museums of the geological survey and the Caroline Medical Institute, and the archives in the record office (*Riksarkivet*).

Recreations.—Among places of entertainment, the royal theatre is managed by a company receiving a state subsidy. The Dramatic Theatre (*Dramatiska Teatern*), in Kungsträdgårds-Gatan, the Swedish (*Svenska*) theatre in Blasieholms-Gatan, and the Vasa theatre in Vasa-Gatan may also be mentioned. The Djürgård is the principal place for variety entertainments in summer. Several of the leading sporting clubs have their headquarters in Stockholm. An annual regatta is held early in August by the Royal Swedish Yacht Club (*Svenska Segelsällkapet*). A harbour much frequented by yachts is Sandhamn in the outer *skärgård*. The Stockholm General Skating Club (*Almänna Skridskoklubb*) is the leading institution for the most favoured winter sport. A characteristic spectacle in winter is the tobogganing in the Humlegård on holidays. The principal athletic ground is the Idrottspark (Sports Park), on the north side of Östermalm, with tennis courts and a cycling track, which may be changed into a skating-rink in winter. There is a similar park at Djursholm.

Commerce.—The industries of Stockholm are miscellaneous. The value of the output of these is nearly thrice those of Malmö or Gothenburg, the next most important manufacturing towns, and the industries of Stockholm exceed those of every *län* (administrative division) except Malmöhus. The iron and steel industries are very important. including engineering in every branch, and shipbuilding. Factories for articles of human consumption (*e.g.* breweries and tobacco works) are numerous; and cork, wood, silk and leather works may also be mentioned. Fine ware is produced by the Rörstrand and Gustafsberg porcelain works. In addition there are various government works, as the mint and printing works. Stockholm is the first port in Sweden for import trade, but as regards exports ranks about level with Malmö and is exceeded by Gothenburg. The imports average nearly 30% of those of the whole country, but the exports only 9%, Stockholm having proportionately little share in the vast timber export trade. Vessels of 23 ft. draught can go up to the city (Skeppsbro and Blasieholm quays), and there is an outport at Värtan on the Lilla Värtan channel to the north-east.

Government.—Stockholm is the centre of government and the usual residence of the king; in summer he generally occupies one of the neighbouring country palaces. The city is the seat of the high court of justice (*Högsta Domstolen*) and of the court of appeal for the northern and midland districts (*Svea Hofrätt*). It is one of the two Swedish naval stations (Karlskrona being the principal one), and the headquarters of the fourth and fifth army divisions. As regards local government, Stockholm is a *län* (administrative district) in itself, distinct from the rural *län* of the same name, under a high governor (*öfverståthållare*) and deputy, with departments for secretarial work, taxation and police. The city is in the diocese of Upsala, but has a separate consistory, composed of the rectors of the city parishes, the president of which is the rector of St Nicholas (*Storkyrka*).

Population.—The population of Stockholm in 1900 was 300,624. In 1751 it was 61,040; in 1850, 93,070; and in 1880, 176,875.

History.—Before the rise of Stockholm, Björkö, Sigtuna and Upsala were places of great importance. Björkö (" the isle of birches "), by foreign authors called Birka, was a kind of capital where the king lived occasionally at least; history speaks of its relations with Dorestad in the Netherlands, and the extensive refuse heaps of the old city, as well as the numerous sepulchral monuments, show that the population must have been large. But though situated at a central point on Lake Mälar, it was destroyed, apparently before the beginning of the 11th century (exactly when or by whom is uncertain); and it never recovered. Sigtuna, lying on the shore of a far-reaching northern arm of Lake Mälar, also a royal residence and the seat of the first mint in Sweden, where English workmen were employed by King Olaf at the beginning of the 11th century, was destroyed in the 12th century. Stockholm was founded by Birger Jarl, it is said, in or about 1255, at a time when pirate fleets were less common than they had been, and the government was anxious to establish commercial relations with the towns which were now beginning to flourish on the southern coast of the Baltic. The city was originally founded as a fortress on the island of Stadholm. The castle was erected at the north-eastern corner, and the city was surrounded with walls having fortified towers on the north and south. It came to be called Stockholm (" the isle of the log," Latin *Holmia*, German *Holm*); the true explanation of the name is not known. During the middle ages the city developed steadily, and grew to command all the foreign commerce of the midlands and north, but it was not until modern times that Stockholm became the capital of Sweden. The medieval kings visited year by year different parts of the kingdom.

See P. R. Ferlin, *Stockholms Stad* (Stockholm, 1854–1858); C. Lundin and A. Strindberg, *Gamla Stockholm* (Stockholm, 1882); C. Lundin *Nya Stockholm* (Stockholm, 1890); G. Nordensvan, *Mälardrottningen* [" the queen of Mälar "] (Stockholm, 1896); E. W.

Dahlgren, *Stockholm, Sveriges hufvustad skildrad* (Stockholm, 1897, issued by the municipal council on the occasion of the Stockholm Exhibition, 1897).

STOCKING (a diminutive of "stock," post, stump, properly that which is stuck or fixed), a close-fitting covering for the foot and lower part of the leg, formerly made of cloth but now of wool, silk or cotton thread knitted by hand or woven on a frame (see HOSIERY). "Stock" being the stump, *i.e.* the part left when the body is cut off, the word was applied to the whole covering of the lower limbs, which was formerly in one piece, the "upper-stocks" and "nether-stocks" forming the two pieces into which it was subsequently divided, when the upper part became the trunk hose and later knee-breeches, the lower the "stockings." A parallel is found in French; the hose are *chausses*, the upper part *haut de chausses*, the stockings *bas de chausses*, or simply *bas*. The German *Strumpf*, stocking, means also a stump, pointing to the original use of the word. Half-stockings, reaching to the lower part of the calf of the leg, and worn by men since the use of the long trousers has superseded knee-breeches, and also by children, are usually styled "socks." This word is an adaptation of Latin *soccus*, a slipper or light shoe. It was the shoe worn by the actors in Roman comedy—and so was used symbolically of comedy, as "buskin," the high boot or *cothurnus*, was of tragedy.

STOCKMAR, CHRISTIAN FRIEDRICH, BARON VON (1787–1863), Anglo-Belgian statesman, who came of a Swedish family, was born at Coburg on the 22nd of August 1787. He was educated as a physician, and in that capacity became attached in 1816 to Prince Leopold of Saxe-Coburg-Gotha on his marriage to Princess Charlotte of England. When she died next year he remained Leopold's private secretary, controller of the household and political agent, until the prince became in 1831 king of the Belgians. He was thus brought into contact with the leading statesmen of Europe, and his disinterestedness and profound acquaintance with English and European social and political questions impressed themselves on all who were associated with him. In 1831 he retired to his home at Coburg, in order not to excite Belgian jealousies by residing at his master's court in the capacity of confidential adviser, but he continued to be Leopold's right-hand man. In 1837 Leopold sent him to England as adviser to the young Queen Victoria, and in the next year he accompanied Prince Albert (afterwards Prince Consort) on his tour in Italy, partly as tutor but also with the direct object of satisfying King Leopold and the queen as to the fitness of the prince for the position already marked out for him in England. He won the complete confidence of the prince as well as of the queen, and on their marriage in 1840 he became their trusted though unofficial counsellor, dividing his time more or less between England and the Continent. In 1848 he was the ambassador of Coburg to the German parliament. He had at heart the unity of Germany under Prussia and close relations between Germany and England, and for these he steadfastly worked; but his political activity was a good deal resented in English circles, which were jealous of Prince Albert's—and generally of German—influence. He died at Coburg on the 9th of July 1863.

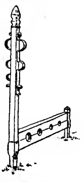
See the articles on VICTORIA, QUEEN; and ALBERT, PRINCE CONSORT. Selections from Stockmar's papers were published by his son Ernest in 1872, and a biography by Justi appeared at Brussels in 1873; see also *The Letters of Queen Victoria* (1907).

STOCKPORT, a municipal, county and parliamentary borough of England, mainly in Cheshire, but partly in Lancashire, 6 m. S.E. of Manchester. Pop. (1901), 92,832. It occupies a hilly site at the junction of the rivers Tame and Mersey; the larger part of the town lying on the south (left) bank, while the suburb of Heaton Norris is on the Lancashire bank. Several bridges cross the stream, and a lofty railway viaduct bestrides the valley. Stockport is served by the London & North Western, Midland, Great Central, Cheshire lines, and Sheffield & Midland railways, and has tramway connexion with Manchester. It is a town of varied industries, but the most important are the cotton and hat manufactures. The church of St Mary was built mainly *c.* 1817, but the chancel belonged to a former church, and retains a Decorated east window and other good details. The town hall was designed by Sir Brumwell Thomas, and opened in 1908, and St George's church (1897). On the acquisition of the market rights by the town from Lord Vernon in 1847 the corporation secured the site of Vernon Park, in which stands a museum presented in 1858 by James Kershaw and John Benjamin Smith. The grammar school was founded in 1487 by Sir Edmund Shaa or Shaw, lord mayor of London. The Stockport Sunday school, founded in 1784, is one of the largest in England. Stockport was enfranchised in 1832, and returns two members. Its most distinguished representative was Richard Cobden (1841–1847), who is commemorated by a statue in St Peter's Square. The town was incorporated in 1835, and is under a mayor, 16 aldermen and 48 councillors. The county borough was created in 1888. Area, 5492 acres.

During the Roman occupation of Britain there was a small military station on the site of Stockport, acting as an outpost to the Roman camp at Manchester. The convergence of Roman roads at this point would make the place a particularly convenient centre. The etymology of the name may be Saxon, but there is no evidence of a Saxon settlement, and the place is not mentioned in Domesday. A castle was in existence in the 12th century, but is not mentioned after 1327. Stockport (Stokeporte, Stopport, Stopford) was made a free borough by a charter of Robert de Stokeport about the year 1220. It was then granted that the burgesses might elect from among themselves a chief officer, who was first called a mayor in 1296. The right of the burgesses to his election was, however, lost, and the mayor was always nominated by the lord of the manor. This arrangement lasted until 1565, when the burgesses put in a claim to their right of election, and it was decided that out of four burgesses nominated by the lord of the manor the jury of the court leet should select the mayor. Thus Stockport was not a true municipal borough until formally incorporated under the Municipal Corporations Act of 1835. The manufacture of hemp began in Stockport in the 16th century, and that of silk-covered buttons in the 17th. In 1732 a silk mill was erected, but the silk trade was superseded by the cotton trade early in the 19th century. The hat trade developed at least as early as the end of the 18th century.

See Henry Heginbotham, *Stockport Ancient and Modern* (1882); J. P. Earwaker, *East Cheshire* (1877); John Watson, *Memoirs of the Earls of Warren and Surrey* (1782).

STOCKS, a wooden structure formerly in use both on the continent of Europe and in Great Britain as a method of punishment for petty offences. The culprit sat on a wooden bench with his ankles, and sometimes his wrists or even neck, thrust through holes in movable boards, generally for at least several hours. That stocks were used by the Anglo-Saxons is proved by their often figuring in drawings of the time (see Harleian MSS. No. 65). The second Statute of Labourers (1350) ordered the punishment for unruly artisans. It further enjoined that stocks (ceppes) should be made in every town between the passing of the act and the following Pentecost. The act appears to have been ill observed, for in 1376 the Commons prayed Edward III. that stocks should be set up in every village. Though never expressly abolished, the punishment of the stocks began to die out in England during the early part of the 19th century, though there is a recorded case of its use so late as 1865 at Rugby. In many of the villages in the country may still be seen well-preserved examples of stocks, in some cases with whipping posts attached. In the United States stocks were of frequent use in the 18th century, more particularly in the New England States; while in the Southern States they were employed for punishing slaves.



STOCKS and SHARES. A "share," in the financial sense, is simply the right to participate in the profits of a particular joint-stock undertaking. In the United Kingdom, in the case of a company constituted under the Companies Acts 1862–1907 as a company limited by shares, the memorandum of association is required to state—among other matters—the amount of capital with which the company proposes to be registered and the amount of the shares into which such capital is divided. Company statistics show a tendency of late years on the part of companies to register with a smaller nominal capital than they did. The tendency too has been to lower the denomination of the shares. £100 shares, for instance, are now very rare. £1 shares and £5 shares are the most common. They obviously appeal better to the small investor. A typical capital clause runs thus: " The capital of the company shall be £100,000 divided into 100,000 shares of £1 each with such rights as regards dividends and other privileges as are defined by the company's articles of association for the time being," or " The capital of the company is £150,000 divided into 50,000 preference shares of £1 and 100,000 ordinary shares of £1 each. Such preference shares shall confer a right to a fixed cumulative preferential dividend at the rate of 10% per annum." The form of capital clause varies of course, but the more approved practice now is to leave the rights of preferential shareholders to be defined by the articles, and for this reason: that if such rights are fixed by the memorandum of association without qualification they cannot be subsequently varied. Articles, on the contrary, are always alterable, and as the preference shareholder takes his shares subject to this known liability to alteration no wrong is done him. If the powers of alteration were abused so as to amount to a fraud by the ordinary shareholders on the minority of preference shareholders the court would probably interfere by injunction. The preferential or other special privileges of any particular class of shareholders are now further safeguarded by s. 39 of the Companies Act 1907. The right of a preference shareholder is commonly confined to a preferential dividend and this dividend is prima facie cumulative, that is to say if the profits of the particular year are insufficient to pay it the deficiency must be made good out of the profits of subsequent years: but it is very common to give preference shareholders priority also as regards capital in the winding-up. Founders' shares originated with private companies, being a convenient means of securing to the partners in the vendor firm, on conversion, the control of the business as well as the lion's share of the profits. Thence they passed to ordinary trading companies, that is, companies which appeal to the public for their capital. Founders' shares in this connexion commonly entitle the holders to one-half or one-third of the company's profits after payment of a fixed dividend of, say, 7 to 10% to the ordinary shareholders. Founders' shares are mostly subscribed for by the vendors or promoters, though sometimes used by way of bonus to attract subscribers for the ordinary or deferred shares. They are now becoming rare.

Share Warrants to Bearer.—The Companies Act (1862) made no provision for the creation of shares to bearer. All shares under the act are registered and the title on the register is evidenced by a share certificate. The act of 1867 introduced shares to bearer under the title of " share warrants to bearer." A share warrant entitles the bearer to the shares or stock specified in it and such shares or stock are transferable by delivery of the warrant. The warrant is always treated as a negotiable instrument.

" Stock " in the case of companies constituted under the Companies Acts 1862–1907 is created by converting paid-up shares into stock. This may be done under s. 12 of the Companies Act 1862 by resolution. Under the same section a company may increase its capital by the issue of new shares or consolidate it into shares of larger amount; and by s. 21 of the Companies Act 1867 a company may subdivide its shares. The Companies Act 1907 (s. 39) gives a company a further power by special resolution, confirmed by an order of the court, to reorganize its capital, whether by the consolidation of shares of different classes or by the division of its shares into shares of different classes—but no preference or special privilege attached to any class of shares is to be interfered with except by a resolution passed by a majority of shareholders of that class representing three-fourths of the capital of that class. A limited company cannot reduce its capital without the sanction of the court.

Public Companies.—The provisions as to shares and stock under the Companies Clauses Acts 1845, 1863, 1869, are, with a few exceptions, analogous to those under the Companies Acts. The capital of the company is to be divided into shares of a certain number and amount. A share register is to be kept and certificates are to be issued to shareholders; and power is given to convert paid-up shares into a general capital stock to be divided among the shareholders according to their respective interests therein. Such stock has been called a " set of shares put together in a bundle." Preference shares may be created, but there is this difference between preference shares under the Companies Clauses Act and under the Companies Acts, that under the Companies Clauses Acts preference shares are entitled to dividends only out of the profits of each year; under the Companies Acts the dividends as above stated are prima facie cumulative. Shares and stock may under the Companies Clauses Act be issued at a discount; under the Companies Acts they cannot. Under the Companies Clauses Acts if the old shares of the company are at a premium any new shares are to be offered first to the old shareholders. This is not found in the Companies Acts, but a similar provision is commonly inserted in the articles of companies formed under the acts. (E. MA.)

STOCKTON, FRANCIS RICHARD (1834–1902), American novelist, was born in Philadelphia, Pennsylvania, on the 5th of April 1834. He had a high school education; became a skilled wood engraver; wrote for the Philadelphia *Morning Post*, the New York *Hearth and Home*, *Scribner's Monthly* and *St Nicholas*, of which he became assistant editor in 1873; and about 1880 he gave up editorial work for independent authorship. Thereafter he lived in Nutley, New Jersey, in Convent, New Jersey, and after 1899 in the Shenandoah Valley, near Charles Town, West Virginia. He died in Washington, D.C. on the 20th of April 1902. His fanciful stories for children made him very popular; among them are *The Ting-a-Ling Stories* (1870), *Roundabout Rambles in Lands of Fact and Fancy* (1872), *What Might Have Been Expected* (1874), *Tales Out of School* (1875), *A Jolly Fellowship* (1880), *The Floating Prince and Other Fairy Tales* (1881), *The Story of Viteau* (1884), *Personally Conducted* (1889), and *Captain Chap* (1897). His amusing and original *Rudder Grange* (1879), a series of sketches rather than a novel, established his reputation with older readers and is his best long work. His peculiar talent was for the short story; and the best examples are the title stories of the volumes *The Lady or the Tiger?* (1884), one of the most popular of American stories, *The Christmas Wreck* (1886), *The Bee Man of Orn* (1887), (also in the latter volume " A Tale of Negative Gravity " and " The Remarkable Wreck of the Thomas Hyke "), and the novelette *The Casting Away of Mrs Lecks and Mrs Aleshine* (1886), with its sequel *The Dusantes* (1888).

Among his other works of fiction are *The Late Mrs Null* (1886), *The Hundredth Man* (1887), *Amos Kilbright: his Adscititious Experiences, with Other Stories* (1888), *The Great War Syndicate* (1889), *The Merry Chanter* (1890), *Ardis Claverden* (1890), *The Rudder Grangers Abroad, and Other Stories* (1891), *The House of Martha* (1891), *The Squirrel Inn* (1891), *The Watchmaker's Wife and Other Stories* (1893), *Pomona's Travels* (1894), *The Adventures of Captain Horn* (1895), with its sequel, *Mrs Cliff's Yacht* (1896), *The Great Stone of Sardis* (1898), *Kate Bonnet* (1902), and *The Captain's Toll-Gate* (with a memoir by Mrs Stockton, and a bibliography, 1903).

STOCKTON, a city and the county seat of San Joaquin county in central California, U.S.A., at the head of the Stockton channel of the San Joaquin river, about 48 m. S.E. of Sacramento. Pop. (1900), 17,506, of whom 4057 were foreign-born; (1910 census) 23,253. It is served by the Atchison, Topeka & Santa Fé, the Western Pacific and the Southern Pacific railways, and has also a considerable river trade with San Francisco. It is at the head of regular navigation on the river; at high water boats occasionally go to Hills Ferry, 150 m. beyond Stockton. The channel has been much improved by the Federal government since 1877. Stockton has a perfectly level site, broad streets and a regular plan. In the city are a good public library, the San Joaquin county law library, St Agnes academy, St Mary's college, a children's home (1896; under the Ladies' Aid Society), St Joseph's home (1899) for the aged, and St Joseph's hospital (1899), both under the Sisters of St Dominic, the Pacific hospital, a county hospital and a state hospital for the insane (1851). Situated in the great valley of the San Joaquin, in the midst of a rich agricultural region, it is one of the largest grain, vegetable and fruit markets of the West. It manufactures flour, lumber, agricultural machinery and implements, &c. Its factory product in 1905 was valued at $8,029,490, or 45·3% more than in 1900. Stockton rose into prominence in the early mining days. A settlement named Tuleberg, later called New Albany, stood on the city site in 1847; its future was precarious when the discovery of gold insured its prosperity. In the spring of 1849 a town was laid out and the present name adopted in honour of Commander Robert Field Stockton (1795–1866), who with Colonel John C. Fremont and General Stephen W. Kearny had gained possession of California for the United States during the war with Mexico. In 1850 Stockton became the county-seat and was chartered as a city.

STOCKTON-ON-TEES, a market town, municipal and parliamentary borough, and port of Durham, England, on the N. bank of the Tees, 5½ m. above its mouth, and on the North Eastern railway, 236 m. N. by W. from London. Pop. (1901), 51,478. The parliamentary borough extends across the river into Yorkshire, to include the municipal borough of Thornaby-on-Tees. At Norton, 1 m. north, the church of St Mary, formerly collegiate, shows fine Norman work. The chief buildings are a town hall, with clock-tower and spire, borough-hall, exchange and public library. The quays are accessible to vessels drawing 20 ft. at high water spring tides. There are extensive steel works, blasting furnaces, iron and brass foundries and rolling-mills; and iron shipbuilding is an important industry. There are also sailcloth works, potteries, breweries and brick and tile works. Exports (iron manufactures, coal and agricultural produce) were valued at £435,439 in 1900; imports (timber, iron, grain, &c.) at £280,371; trade being chiefly with Holland and the Baltic ports, and coastal. The parliamentary borough returns one member. The municipal borough is under a mayor, 10 aldermen and 30 councillors, and has an area of 2935 acres.

It would seem that Stockton (Stokton) grew up round the castle of the bishops of Durham, to whom the town belonged even before their purchase of the earldom of Sadberge. In 1183 the Boldon Book records that the whole town rendered one milch cow and the ferry twenty pence to the bishop. The castle was probably built between 1183 and 1214. King John visited Bishop Philip of Poitou (d. 1208) there and is said to have granted the place a charter similar to that of Hartlepool in 1214. Of this, however, no traces remain, the rights of the borough, which must have come into existence during the 13th century, being purely prescriptive. Stockton was divided into two parts: the "town," governed by the bailiff of the bishop and afterwards by the vicar and vestrymen, and the borough, under a mayor and aldermen. The bishop's bailiff was also the keeper of the castle, though in the 17th century the office belonged to the borough-bailiff. The borough is first mentioned in 1283, when the king took tallage from it during the vacancy of the see. It occurs again in a record of 1328, and in 1344 the mayor and bailiffs entered into an agreement with the mayor and bailiffs of Newcastle for the regulation of trade between the two places. Bishop Hatfield's survey (1377–1382) gives a list of tenants within the borough: 22 burgages and 15 half-burgages are mentioned, the rent of which varies from twenty-two pence to a penny halfpenny. In 1644 the parliamentary troops besieged and captured the castle, which was dismantled in 1652. In 1666 the population was only 544, for Stockton was an isolated place with little trade. It became a parliamentary borough, returning one member, in 1867. In 1310 the bishop gave the town a market and a fair during the octave of the Translation of St Thomas the Martyr, reserving to himself the tolls; Bishop Morton revived the market, which had lapsed at the beginning of the 17th century. Camden speaks of Stockton as a neat, well-built corporation town and especially commends the ale brewed there and sent to various parts of the country. The importance of Stockton as a port dates from the end of the 18th century, when there was a considerable trade in lead, dairy produce and timber.

STODDARD, RICHARD HENRY (1825–1903), American author, was born in Hingham, Massachusetts, on the 2nd of July 1825. He spent most of his boyhood in New York City, where he became a blacksmith and later an iron moulder, but in 1849 he gave up his trade and began to write for a living. He contributed to the *Union Magazine*, the *Knickerbocker Magazine*, *Putnam's Monthly Magazine* and the New York *Evening Post*. In 1853 Nathaniel Hawthorne helped him to secure the appointment of inspector of customs of the Port of New York. He was confidential clerk to George B. McClellan in the New York dock department in 1870–1872, and city librarian of New York in 1874–1875; literary reviewer for the New York *World* (1860–1870); one of the editors of *Vanity Fair*; editor of the *Aldine* (1869–1874), and literary editor of the *Mail and Express* (1880–1903). He died in New York on the 12th of May 1903. Among the numerous books that he edited are *The Loves and Heroines of the Poets* (1861); *Melodies and Madrigals, Mostly from the old English Poets* (1865); *The Late English Poets* (1865), selections; Griswold's *Poets and Poetry of America* (1872), and *Female Poets of America* (1874); *The Bric-a-Brac Series*, in 10 vols. (1874–1876); *English Verse*, in 5 vols. edited with W. J. Linton (1883); and four editions of Poe's works, with a memoir (1872–1894). His original poetry includes *Footprints* (1849), privately printed and afterwards suppressed; *Poems* (1852); the juveniles, *Adventures in Fairyland* (1853); *Town and Country* (1857), and *The Story of Little Red Riding Hood* (1864); *Songs of Summer* (1857); *The King's Bell* (1862), one of his most popular narrative poems; *Abraham Lincoln: A Horatian Ode* (1865), *The Book of the East* (1867), *Poems* (1880), a collective edition; and *The Lion's Cub, with Other Verse* (1890). He also wrote *Life, Travels and Books of Alexander von Humboldt* (1860); *Under the Evening Lamp* (1892), essays dealing mainly with the modern English poets; and *Recollections Personal and Literary* (1903), edited by Ripley Hitchcock. More important than his critical was his poetical work, which at its best is sincere, original and marked by delicate fancy, and felicity of form; and his songs have given him a high and permanent place among American lyric poets.

His wife ELIZABETH DREW (BARSTOW) STODDARD (1823–1902), poet and novelist, was born in Mattapoisett, Massachusetts, on the 6th of May 1823. She studied at Wheaton Seminary, Norton, Mass. After her marriage in 1852 she assisted her husband in his literary work, and contributed stories, poems and essays to the periodicals. She wrote three novels—*The Morgesons* (1862), *Two Men* (1865) and *Temple House* (1867), and a volume of poems (1895). A new edition of her novels was issued in 1901. She died in New York on the 1st of August 1902.

STOFFLET, JEAN NICOLAS (1751–1796), Vendéan general, was born at Lunéville, the son of a miller. Long a private soldier in a Swiss regiment in France, and afterwards game-keeper to the comte de Colbert-Maulevrier, he joined the Vendéans when they rose against the Revolution to defend their religious and royalist principles. During the war in La Vendée he served first under Gigot d'Elbée, fought at Fontenay, Cholet and Saumur, and distinguished himself at the battles of Beaupréau, Laval and Antrain. He was appointed major-general of the royalist army, and in 1794 succeeded La Rochejaquelein as commander-in-chief. But his quarrels with another Vendéan leader, F. A. Charette, and the reverses sustained by the Vendéan arms, led him to give in his submission and to accept the terms of the treaty of La Jaunaie (May 2, 1795). He, however, soon violated this treaty, and at the instigation of royalist agents took arms in December 1795 on behalf of the count of Provence (the future Louis XVIII.), from whom he had received the rank of *maréchal-de-camp*. This last attempt of Stofflet's failed completely. He was taken prisoner by the republicans, condemned to death by a military commission, and shot at Angers on the 23rd of February 1796.

See General d'Andigné, *Mémoires*, edited by E. Biré (1900–1901); C. Loyer, "Cholet sous la domination de Stofflet," in *L'Anjou historique*, vol. iii. (1902–1903).

STOICHIOMETRY (Gr. στοιχεῖα, fundamental parts, or elements, μέτρον, measure), in chemistry, a term introduced by

Benjamin Richter to denote the determination of the relative amounts in which acids and bases neutralize one another; but this definition may be extended to include the determination of the masses participating in any chemical reaction. The work of Richter and others who explored this field is treated under ELEMENT; here we discuss a particular branch of the subject, viz. the determination of equivalent and atomic weights of elements, and the molecular weights of elements and compounds. Reference to CHEMISTRY, ATOM and ELEMENT will explain the principles involved. Every element has an "equivalent weight" which is usually defined as the amount of the element which combines with or replaces unit weight of hydrogen; the "atomic weight" may be regarded as the smallest weight of an element which can be present in a chemical compound, and the "molecular weight" is the weight of the least part of an element or compound which can exist alone. The atomic weight is therefore some multiple of the equivalent weight, and the determining factor is termed the valency (*q.v.*) of the element. We have mentioned hydrogen as our standard element, which was originally chosen as being the lightest known substance; but Berzelius, whose stoichiometric researches are classical, having pointed out that few elements formed stable compounds with hydrogen, and even these presented difficulties to exact analysis, proposed to take oxygen as the standard. This suggestion has been adopted by the International Committee of Atomic Weights, who take the atomic weight of oxygen as 16·000, hydrogen being 1·0087.[1]

Deferring the discussion of gaseous elements and compounds we will consider the *modus operandi* of determining, first, the equivalent weight of an element which forms solid compounds, and, secondly, its atomic weight. Suppose we can cause our element in known quantity to combine with oxygen to form a definite compound, which can be accurately weighed, or, conversely, decompose a known weight of the oxide into its constituents, of which the element can be weighed, then the equivalent weight of the element may be exactly determined. For if x grams of the element yield y grains of the oxide, and if W be the equivalent of the element, we have x grams of the element equivalent to $y-x$ grams of oxygen, and hence the equivalent weight W, which corresponds to 8 grams of oxygen, is given by the proportion $y-x : x :: 8 : W$, *i.e.* $W = 8x/(y-x)$. For example, Lavoisier found that 45 parts of red oxide of mercury on heating yielded $41\frac{1}{2}$ parts of mercury; hence $41\frac{1}{2}$ parts of mercury is equivalent to $45-41\frac{1}{2} = 3\frac{1}{2}$ parts of oxygen, and the equivalent of mercury in this oxide is therefore $8 \times 41\frac{1}{2} \div 3\frac{1}{2} = 95$. The question now arises: is this value the true equivalent, *i.e.* half the amount of mercury which combines with *one* atom of oxygen (for one atom of oxygen is equivalent to two atoms of hydrogen)? Before considering this matter, however, we will show how it is possible to obtain the equivalent of elements whose oxides are not suitable for exact analysis. No better example can be found than Stas's classical determination of the atomic weight of silver and of other elements.[2] It will be seen that the routine necessary to the chemical determination of equivalents consists in employing only such substances as can be obtained perfectly pure and stable (under the experimental conditions), and that the reactions chosen must be such as to yield a series of values by which any particular value can be checked or corrected.

Stas's experiments can be classified in five series. The object of the first series was to obtain the ratio Ag:O by means of the ratios KCl:O and Ag:KCl. The ratio KCl:O was determined by decomposing a known weight of potassium chlorate (*a*) by direct heating, (*b*) by heating with hydrochloric acid and weighing the residual chloride. The reaction may be written for our purpose in the form: $KClO_3 = KCl + 3O$; in case *a* the oxygen is liberated as such; in case *b* it oxidizes the hydrochloric acid to water and chlorine oxides. The equation shows that one KCl is equivalent to 3O, and hence if x grams of chlorate yields y grams of chloride, then the ratio $KCl:O = y/\frac{1}{3}(x-y)$. Taking O as 16 and the experimental value of x and y, Stas obtained $KCl:O = 74·9502$. To find the ratio of Ag:KCl, a known weight of silver was dissolved in nitric acid and the amount of potassium chloride necessary for its exact precipitation was determined. The reaction may be written as $AgNO_3 + KCl = AgCl + KNO_3$, which shows that one Ag is equivalent to one KCl. The value found was $Ag:KCl = 1·447110$. The ratio Ag:O is found by combining these values, for $Ag:O = KCl:O \times Ag:KCl = 74·9502 \times 1·44710 = 107·9401$.

In the second series the ratios AgCl:O and AgCl:Ag were obtained, the first by decomposing the chlorate by heating, and the second by synthesizing the chloride by burning a known weight of the metal in chlorine gas and weighing the resulting chloride, and also by dissolving the metal in nitric acid and precipitating it with hydrochloric acid and ammonium chloride. These two sets yield the ratio Ag : O, and also the ratio Cl : O, which, combined with the ratio KCl : O obtained in the first series, gave the atomic weight of potassium. The third and fourth series resembled the second, only the bromate and bromide, and iodate and iodide were worked with. The experiments gave additional values for Ag:O and also the atomic weights of bromine and iodine.

The fifth series was concerned with the ratios $Ag_2SO_4 : Ag$; $Ag_2S : Ag$ and $Ag_2S:O$. The first was obtained by reducing silver sulphate to the metal by hydrogen at high temperatures; the second by the direct combination of silver and sulphur, and also by the interaction of silver and sulphuretted hydrogen; these ratios on combination gave the third ratio $Ag_2S:O$. These experiments besides giving values for Ag:O, yielded also the atomic weight of sulphur. There is no need to proceed any further with Stas's work, but it is sufficient to say that the general routine which he employed has been adopted in all chemical determinations of equivalent weights.

The derivation of the atomic from the equivalent weight may be effected in several ways. The simplest are perhaps by means of Dulong and Petit's law of atomic heats (and by Neumann's extension of this law), and by Mitscherlich's doctrine of isomorphism. Dulong and Petit's law may be stated in the form that the product of the specific heat and atomic weight is approximately 6·4, or that an approximate value of the atomic weight is 6·4 divided by the specific heat. This application may be illustrated in the case of mercury. We have seen above that the red oxide yields a value of about 95 for the equivalent; but a green oxide is known which contains twice as much metal for each part of oxygen, and therefore in this compound the equivalent is about 190. The specific heat of mercury, however, is 0·033, and this number divided into 6·4 gives an approximate atomic weight of 194. More accurate analyses show that mercury has an equivalent of 100 in the red oxide and 200 in the green; Dulong and Petit's law shows us that the atomic weight is 200, and that the element is divalent in the red oxide and monovalent in the green. For exceptions to this law see CHEMISTRY: § *Physical*.

The application of isomorphism follows from the fact that chemically similar substances crystallize in practically identical forms, and, more important, form mixed crystals. If two salts yield mixed crystals it may be assumed that they are similarly constituted, and if the formula of one be known, that of the other may be written down. For example gallium sulphate forms a salt with potassium sulphate which yields mixed crystals with potash alum; we therefore infer that gallium is trivalent like aluminium, and therefore its atomic weight is deduced by multiplying the equivalent weight (determined by converting the sulphate into oxide) by three. General chemical resemblances yield valuable information in fixing the atomic weight after the equivalent weight has been exactly determined.

Gases.—The generalization due to Avogadro—that equal volumes of gases under the same conditions of temperature and pressure contain equal numbers of molecules—may be stated in the form that the densities of gases are proportional to their molecular weights. It therefore follows that a comparison of the density of any gas with that of hydrogen gives the ratio of the molecular weights of the two gases, and if the molecular contents of the gases be known then the atomic weight is determinable. Gas reactions are available in many cases for solving the question whether a molecule is monatomic, diatomic, &c. Thus from the combination of equal volumes of hydrogen and chlorine to form twice the volume of hydrochloric acid, it may

[1] We may here state that the equivalent weight of oxygen on this basis is 8·000, *i.e.* one half of its atomic weight. This matter is considered below.

[2] The formulae used in the following paragraph were established before Stas began his work; and as oxygen is taken as 16, the results are atomic and not equivalent weights.

be deduced that the molecule of hydrogen and of chlorine contains two atoms (see ATOM); and similar considerations show that oxygen, nitrogen, fluorine, &c., are also diatomic. Physical methods may also be employed. For instance, in monatomic gases the ratio of the specific heat at constant pressure to the specific heat at constant volume is 1·66; in diatomic gases 1·42; with other values for more complex molecules (see MOLECULE). This ratio may be determined directly by finding the velocity of sound in the gas (Kundt) or by other methods, or indirectly by finding the specific heats separately and then taking the ratio. It is found that the gases just mentioned are diatomic, whereas argon, helium, neon and the related gases, and also mercury and some other metals when in the gaseous condition, are monatomic. A knowledge of the atomicity of a gas combined with its density (compared with oxygen and hydrogen) would therefore give its atomic weight if Avogadro's law were rigorously true. But this is not so, except under extremely low pressures, and it is necessary to correct the observed densities. The correction involves a detailed study of the behaviour of the gas over a large range of pressure (presuming the densities are already corrected to 0°), and may be conveniently written in the form $a=\frac{1}{pv}\frac{d(pv)}{dp}$. Thus if D be the observed relative densities of a gas to hydrogen at 0° and under normal atmospheric pressure, a_X and a_H the coefficients of the gas and hydrogen, then the true density, or ratio of molecular weights, is $D \times (1+a_X)/(1+a_H)$.

Lord Rayleigh and D. Berthelot have corrected several molecular weights in this fashion. The importance is well shown in the modification of Morley's observed density of oxygen, viz. 15·90, which, with Rayleigh's values of $a_O = -0{\cdot}00094$ and $a_H = +0{\cdot}00053$, gives the corrected density as 15·88. And this value is the atomic weight, for both hydrogen and oxygen molecules contain two atoms. Compound gases can also be experimented with. For example Gray (*Journ. Chem. Soc.*, 1905, 87, p. 1601) found that it was easier to prepare perfectly pure nitric oxide than to obtain pure nitrogen, and he therefore determined the density of this gas from which the atomic weight of 14·012, or, corrected for deviations from Avogadro's law, 14·006, was deduced.

The principle indicated here is applicable to the determination of the molecular weight of any vaporizable substance by the so-called method of vapour-density (see DENSITY).

Solutes.—The theory of solution permits the investigation of the molecular weights of substances which dissolve in water or some other solvent. It is shown in SOLUTION that a solute lowers the freezing point and raises the boiling point of the solvent in a regular manner as long as dilute solutions are dealt with. It has been shown that if one gram molecule of a solute be dissolved in 100 grams of solvent then the boiling point is raised by $0{\cdot}02\ T^2/w$. (say D) degrees, where T is the absolute boiling point and w the latent heat of vaporization of the solvent; this constant is known as the molecular rise of the boiling point, and varies from solvent to solvent. If we dissolve say m grams of a substance of molecular weight M in 100 grams of the solvent and observe the elevation in the boiling point, then M is given by $M = mD/d$. Similar considerations apply to the freezing points of solutions. In this case $D = 0{\cdot}02\ T^2/w$, where T is the absolute freezing point of the pure solvent and w the latent heat of solidification. To apply these principles it is only necessary therefore to determine the freezing (or boiling) point of the solvent (of which a known weight is taken), add a known weight of the solute, allow it to dissolve and then notice the fall (or rise) in the freezing (or boiling point), from which values, if the molecular depression (or elevation) be known, the molecular weight of the dissolved substance is readily calculated.

The following are the molecular depressions and elevations (with the freezing and boiling points in brackets) of the commoner solvents.

Molecular depressions: aniline (6°), 58·7; benzene (5·4°), 50·0; acetic acid (17·0°), 39·0; nitrobenzene (5·3°), 70·0; phenol (40°), 72; water (0°), 18·5.

Molecular elevations: acetic acid (118·1°), 25·3; acetone (56°), 17·1; alcohol (78°), 11·7; ether (35°), 21·7; benzene (79°), 26·7; chloroform (61°), 35·9; pyridine (115°), 29·5; water (100°), 5·1.

The apparatus used in cryoscopic measurements is usually that devised by Beckmann (*Zeit. phys. Chem.* ii. 307). The working part consists of a tube 2–3 cms. in diameter, bearing a side tube near the top; the tube is fitted with a cork through which pass a differential thermometer of a range of about 6° and graduated in 50ths or 100ths, and also a stout platinum wire to serve as a stirrer. The lower part of the tube is enclosed in a wider tube to serve as an air-jacket, and the whole is immersed in a large beaker. The thermometer is adjusted so that the freezing point of the pure solvent comes near the top of the scale. A weighed quantity of the solvent is placed in the inner tube, and the beaker is filled with a freezing mixture at a temperature a few degrees below the freezing point of the solvent. The thermometer is inserted and both solvent and freezing mixture are stirred. When the temperature is about 0·3° below the correct freezing point the tube is removed from the beaker and the stirring continued. There ensues a further fall in the thermometer reading until ice separates, whereupon the temperature rises to the correct freezing point. The ice is then melted and the operation repeated so as to obtain a mean value. A known weight of the substance is introduced through the side tube, and the freezing point determined as with the pure solvent. The difference of the readings gives the depression; and from this value, knowing the weight of the solute and solvent, and also the molecular depression, the molecular weight can be calculated from the formula given above.

In the boiling point apparatus of Beckmann the solvent is contained in a tube fitted with side tubes to which spiral condensers can be attached; the neck of the tube carries a stopper through which passes a delicate differential thermometer, whilst the bottom is perforated by a platinum wire and contains glass beads, garnets or platinum foil to ensure regular boiling. The tube is surrounded by a jacket mounted on an asbestos box, so that the heating is regular. In conducting a determination the thermometer is adjusted so that the boiling point of the pure solvent is near the bottom of the scale. A known weight of the solvent is placed in the tube, the thermometer is inserted (so that the liquid completely covers the bulb), and the condensers put into position. The liquid is now cautiously heated, and when the thermometer becomes stationary the boiling point is reached. The temperature having been read, the apparatus is allowed to cool slightly, and the observation repeated. A known weight of the substance is now introduced, and the solution so obtained treated in the same fashion as the original solvent.

A different procedure wherein the boiling tube is heated, not directly, but by a stream of the vapour of the pure solvent, was proposed by Sakurai (*Journ. Chem. Soc.*, 1892, 61, p. 994). Sakurai's apparatus has been considerably modified, and the form now principally used is essentially due to Landsberger (*Ber.*, 1898, 31, p. 461). The boiling vessel is simply a flask fitted with a delivery tube, which is connected with the measuring tube. This consists of a graduated tube fitted with a stopper through which passes a thermometer and an inlet tube reaching nearly to the bottom. The measuring tube is surrounded by an outer tube which has an exit to a condenser at the side or bottom, communication being made between the measuring tube and jacket by a small hole near the top of the former. In outline the operation consists in placing some solvent in the measuring tube and passing in vapour until the condensed liquid falls at the rate of one drop per second or two seconds. The temperature is then read off. A known weight of the substance is introduced and the boiling point determined as before; but immediately the temperature is read the tube must be disconnected, so that no more vapour passes over and so alters the concentration of the solution. Two methods are in use for determining the quantity of the solvent. Landsberger weighed the tube; Walker and Lumsden (*Journ. Chem. Soc.*, 1898, 73, p. 502) graduated the tube and thus measured the volume of the solvent; in W. E. S. Turner's apparatus (*Journ. Chem. Soc.*, 1910. 97, p. 1184) both the weight and volume can be determined. Whilst the calculations in both the Beckmann and Sakurai-Landsberger methods are essentially the same the " molecular elevations " differ according as one deals with 100 grams or 100 ccs. of solvent. In all these methods it is necessary to carefully choose the solvent in order to avoid dissociation or association. For example, most salts are dissociated in aqueous solution; and acids are bi-molecular in benzene but normal in acetic acid.

Other methods are available for dissolved substances such as measurements of the osmotic pressure, lowering of the vapour pressure and diminution of solubility, but these are little used. Mention may also be made of Ramsay and Shield's method of finding the molecular weights of liquids from surface tension measurements. (See CHEMISTRY: § *Physical.*)

STOICS, a school of philosophers founded at the close of the 4th century B.C. by Zeno of Citium, and so called from the Stoa or painted corridor (στοὰ ποικίλη) on the north side of the market-place at Athens, which, after its restoration by Cimon, the celebrated painter Polygnotus had adorned with frescoes representing scenes from the Trojan War. But, though it arose on Hellenic soil, from lectures delivered in a public place at Athens, the school is scarcely to be considered a product of purely Greek intellect, but rather as the firstfruits of that interaction between West and East which followed the conquests of Alexander. Hardly a single Stoic of eminence was a citizen of any city in the heart of Greece, unless we make Aristo of Chios, Cleanthes of Assus and Panaetius of Rhodes exceptions. Such lands as Cyprus, Cilicia and Syria, such cities as Citium, Soli, Heraclea in Pontus, Sidon, Carthage, Seleucia on the Tigris, Apamea by the Orontes, furnished the school with its scholars and presidents; Tarsus, Rhodes and Alexandria became famous as its university towns. As the first founder was of Phoenician descent, so he drew most of his adherents from the countries which were the seat of Hellenistic (as distinct from Hellenic) civilization; nor did Stoicism achieve its crowning triumph until it was brought to Rome, where the grave earnestness of the national character could appreciate its doctrine, and where for two centuries or more it was the creed, if not the philosophy, of all the best of the Romans. Properly therefore it stands in marked antithesis to that fairest growth of old Hellas, the Academy, which saw the Stoa rise and fall—the one the typical school of Greece and Greek intellect, the other of the Hellenized East, and, under the early Roman Empire, of the whole civilized world. The transcendent genius of its author, the vitality and romantic fortunes of his doctrine, claim our warmest sympathies for Platonism. But it should not be forgotten that for more than four centuries the tide ran all the other way. It was Stoicism, not Platonism, that filled men's imaginations and exerted the wider and more active influence upon the ancient world at some of the busiest and most important times in all history. And this was chiefly because before all things it was a practical philosophy, a rallying-point for strong and noble spirits contending against odds. Nevertheless, in some departments of theory, too, and notably in ethics and jurisprudence, Stoicism has dominated the thought of after ages to a degree not easy to exaggerate.

The history of the Stoic school may conveniently be divided in the usual threefold manner: the old Stoa, the middle or transition period (Diogenes of Seleucia, Boethus of Sidon, Panaetius, Posidonius), and the later Stoicism of Roman times. By the old Stoa is meant the period (*c.* 304–205 B.C.) down to the death of Chrysippus, the second founder; then was laid the foundation of theory, to which hardly anything of importance was afterwards added. Confined almost to Athens, the school made its way slowly among many rivals. Aristo of Chios and Herillus of Carthage, Zeno's heterodox pupils, Persaeus, his favourite disciple and housemate, the poet Aratus, and Sphaerus, the adviser of the Spartan king Cleomenes, are noteworthy minor names; but the chief interest centres about Zeno, Cleanthes, Chrysippus, who in succession built up the wondrous system. What originality it had—at first sight it would seem not much—belongs to these thinkers; but the loss of all their works except the hymn of Cleanthes, and the inconsistencies in such scraps of information as can be gleaned from unintelligent witnesses, for the most part of many centuries later, have rendered it a peculiarly difficult task to distinguish with certainty the work of each of the three. The common standpoint, the relation to contemporary or earlier systems, with all that goes to make up the character and spirit of Stoicism, can, fortunately, be more certainly established, and may with reason be attributed to the founder.

Zeno.

Zeno's residence at Athens fell at a time when the great movement which Socrates originated had spent itself in the second generation of his spiritual descendants. Neither Theophrastus at the Lyceum, nor Xenocrates and Polemo at the Academy, nor Stilpo, who was drawing crowds to hear him at Megara, could be said to have inherited much of the great reformer's intellectual vigour, to say nothing of his moral earnestness. Zeno visited all the schools in turn, but seems to have attached himself definitely to the Cynics; as a Cynic he composed at least one of his more important works, "the much admired *Republic*," which we know to have been later on a stumbling-block to the school. In the Cynic school he found the practical spirit which he divined to be the great need of that stirring troublous age. For a while his motto must have been "back to Socrates," or at least "back to Antisthenes." The Stoics always counted themselves amongst the Socratic schools, and canonized Antisthenes and Diogenes; while reverence for Socrates was the tie which united to them such an accomplished writer upon lighter ethical topics as the versatile Persaeus, who, at the capital of Antigonus Gonatas, with hardly anything of the professional philosopher about him, reminds us of Xenophon, or even Prodicus. Zeno commenced, then, as a Cynic; and in the developed system we can point to a kernel of Cynic doctrine to which various philosophemes of other thinkers (more especially Heraclitus and Aristotle, but also Diogenes of Apollonia, the Pythagoreans, and the medical school of Hippocrates in a lesser degree) were added. Thus, quite apart from the general similarity of their ethical doctrine, the Cynics were materialists; they were also nominalists, and combated the Platonic ideas; in their theory of knowledge they made use of "reason" (λόγος), which was also one of their leading ethical conceptions. In all these particulars Zeno followed them, and the last is the more important, because, Chrysippus having adopted a new criterion of truth—a clear and distinct perception of sense—it is only from casual notices we learn that the elder Stoics had approximated to Cynicism in making right reason the standard. At the same time, it is certain that the main outlines of the characteristic physical doctrine, which is after all the foundation of their ethics and logic, were the work of Zeno. The Logos, which had been an ethical or psychological principle to the Cynics, received at his hands an extension throughout the natural world, in which Heraclitean influence is unmistakable. Reading the Ephesian doctrine with the eyes of a Cynic, and the Cynic ethics in the light of Heracliteanism, he came to formulate his distinctive theory of the universe far in advance of either. In taking this immense stride and identifying the Cynic "reason," which is a law for man, with the "reason" which is the law of the universe, Zeno has been compared with Plato, who similarly extended the Socratic "general notion" from the region of morals—of justice. temperance, virtue—to embrace all objects of all thought, the verity of all things that are.

Cleanthes.

If the recognition of physics and logic as two studies coordinate with ethics is sufficient to differentiate the mature Zeno from the Cynic author of the *Republic*, no less than from his own heterodox disciple Aristo, the elaboration on all sides of Stoic natural philosophy belongs to Cleanthes, who certainly was not the merely docile and receptive intelligence he is sometimes represented as being. He carried on and completed the assimilation of Heraclitean doctrine; but his own contributions were more distinctive and original than those of any other Stoic. Zeno's seeming dualism of God (or force) and formless matter he was able to transform into the lofty pantheism which breathes in every line of the famous hymn to Zeus. Heraclitus had indeed declared all to be in flux, but we ask in vain what is the cause for the unceasing process of his ever-living fire. It was left for Cleanthes to discover this motive cause in a conception familiar to Zeno, as to the Cynics before him, but restricted to the region of ethics—the conception of tension or effort. The soul of the sage, thought the Cynics, should be strained and braced for judgment and action; his first need is firmness (εὐτονία) and Socratic strength. But the mind is a corporeal thing. Then followed the flash of genius: this varying tension of the one substance everywhere present, a purely physical fact, accounts for the diverse destinies of all innumerable particular things; it is the veritable cause of the flux and process of the universe.

Herein lies the key to the entire system of the Stoics, as Cleanthes's epoch-making discovery continually received fresh applications to physics, ethics and epistemology. Other of his innovations, the outcome of his crude materialism, found less favour with his successor, who declined to follow him in identifying the primary substance with fire, or in tracing all vitality to its ultimate source in the sun, the "ruling power" of the world—a curious anticipation of scientific truth. Yet under this poetical Heraclitean mystic the school was far from flourishing. The eminent teachers of the time are said to have been Aristo, Zeno's heterodox pupil, and Arcesilas, who in Plato's name brought Megarian subtleties and Pyrrhonian agnosticism to bear upon the intruding doctrine; and after a vigorous upgrowth it seemed not unlikely to die out. From all danger of such a fate it was rescued by its third great teacher, Chrysippus; "but for Chrysippus there had been no Porch."

Chrysippus. Zeno had caught the practical spirit of his age—the desire for a popular philosophy to meet individual needs. But there was another tendency in post-Aristotelian thought—to lean upon authority and substitute learning for independent research—which grew stronger just in proportion as the fresh interest in the problems of the universe and the zeal for discovery declined—a shadow, we may call it, of the coming Scholasticism thrown a thousand years in advance. The representative of this tendency, Chrysippus, addressed himself to the congenial task of assimilating, developing, systematizing the doctrines bequeathed to him, and, above all, securing them in their stereotyped and final form, not simply from the assaults of the past, but, as after a long and successful career of controversy and polemical authorship he fondly hoped, from all possible attack in the future. To his personal characteristics can be traced the hair-splitting and formal pedantry which ever afterwards marked the activity of the school, the dry repellent technical procedure of the Dialecticians *par excellence*, as they were called. He created their formal logic and contributed much that was of value to their psychology and epistemology; but in the main his work was to new-label and new-arrange in every department, and to lavish most care and attention on the least important parts—the logical terminology and the refutation of fallacies, or, as his opponents declared, the excogitation of fallacies which even he could not refute. In his *Republic* Zeno had gone so far as to declare the routine education of the day (*e.g.* mathematics, grammar, &c.) to be of no use. Such Cynic crudity Chrysippus rightly judged to be out of keeping with the requirements of a great dogmatic school, and he laboured on all sides after thoroughness, erudition and scientific completeness. In short, Chrysippus made the Stoic system what it was, and as he left it we proceed to describe it.

Conception of Philosophy. And first we will inquire, What is philosophy? No idle gratification of curiosity, as Aristotle fabled of his life intellectual (which would be but a disguise for refined pleasure), no theory divorced from practice, no pursuit of science for its own sake, but knowledge so far forth as it can be realized in virtuous action, the learning of virtue by exercise and effort and training. So absolutely is the "rare and priceless wisdom" for which we strive identical with virtue itself that the three main divisions of philosophy current at the time and accepted by Zeno—logic, physics and ethics—are defined as the most generic or comprehensive *virtues*. How otherwise could they claim our attention? Accordingly Aristo, holding to Cynicism when Zeno himself had got beyond it, rejected two of these parts of philosophy as useless and out of reach—a divergence which excluded him from the school, but strictly consistent with his view that ethics alone is scientific knowledge. Of the three divisions logic is the least important; ethics is the outcome of the whole, and historically the all-important vital element; but the foundations of the whole system are best discerned in the science of nature, which deals pre-eminently with the macrocosm and the microcosm, the universe and man, including natural theology and an anthropology or psychology, the latter forming the direct introduction to ethics.

Physics. The Stoic system is in brief: (*a*) materialism, (*b*) dynamic materialism, lastly (*c*) monism or pantheism. (*a*) The first of these characters is described by anticipation in Plato's *Sophist* (246 C seq.), where, arguing with those "who drag everything down to the corporeal" (σῶμα), the Eleatic stranger would fain prove to them the existence of something incorporeal, as follows. "They admit the existence of an animate body. Is soul then something existent (οὐσία)? Yes. And the qualities of soul, as justice and wisdom—are they visible and tangible? No. Do they then exist? They are in a dilemma." Now, however effective against Plato's contemporary Cynics or Atomists, the reasoning is thrown away upon the Stoics, who take boldly the one horn of this dilemma. That qualities of bodies (and therefore of the corporeal soul) exist they do not deny; but they assert most uncompromisingly that they are one and all (wisdom, justice, &c.) corporeal. And they strengthen their position by taking Plato's own definition (247 D), namely "being is that which has the power to act or be acted upon," and turning it against him. For this is only true of Body; action, except by contact, is inconceivable; and they reduce every form of causation to the efficient cause, which implies the communication of motion from one body to another. Again and again, therefore, only Body exists. The most real realities to Plato and Aristotle had been thought and the objects of thought, νοῦς and νοητά, whether abstracted from sensibles or inherent in "matter," as the incognizable basis of all concrete existence. But this was too great an effort to last long. Such spiritualistic theories were nowhere really maintained after Aristotle and outside the circle of his immediate followers. The reaction came and left nothing of it all; for five centuries the dominant tone of the older and the newer schools alike was frankly materialistic. "If," says Aristotle, "there is no other substance but the organic substances of nature, physics will be the highest of the sciences," a conclusion which passed for axiomatic until the rise of Neoplatonism. The analogues therefore of metaphysical problems must be sought in physics; particularly that problem of the causes of things for which the Platonic idea and the Peripatetic "constitutive form" had been, each in its turn, received solutions. (*b*) But the doctrine that all existence is confined within the limits of the sensible universe—that there is no being save corporeal being or body—does not suffice to characterize the Stoic system; it is no less a doctrine of the Epicureans. It is the idea of tension or tonicity as the essential attribute of body, in contradistinction to passive inert matter, which is distinctively Stoic. The Epicureans leave unexplained the primary constitution and first movements of their atoms or elemental solids; chance or declination may account for them. Now, to the Stoics nothing passes unexplained; there is a reason (λόγος) for everything in nature. Everything which exists is at once capable of acting and being acted upon. In everything that exists, therefore, even the smallest particle, there are these two principles. By virtue of the passive principle the thing is susceptible of motion and modification; it is matter which determines substance (οὐσία). The active principle makes the matter a given determinate thing, characterizing and qualifying it, whence it is termed quality (ποιότης). For all that is or happens there is an immediate cause or antecedent; and as "cause" means "cause of motion," and only body can act upon body, it follows that this antecedent cause is itself as truly corporeal as the matter upon which it acts. Thus we are led to regard the active principle "force" as everywhere coextensive with "matter," as pervading and permeating it, and together with it occupying and filling space. This is that famous doctrine of universal permeation (κρᾶσις δι' ὅλου), by which the axiom that two bodies cannot occupy the same space is practically denied. Thus that harmony of separate doctrines which contributes to the impressive simplicity of the Stoic physics is only attained at the cost of offending healthy common

Materialism.

Tension.

sense, for Body itself is robbed of a characteristic attribute. A thing is no longer, as Plato once thought, hot or hard or bright by partaking in abstract heat or hardness or brightness, but by containing within its own substance the material of these qualities, conceived as air-currents in various degrees of tension. We hear, too, of corporeal days and years, corporeal virtues, and actions (like walking) which are bodies (σώματα). Obviously, again, the Stoic quality corresponds to Aristotle's essential form; in both systems the active principle, "the cause of all that matter becomes," is that which accounts for the existence of a given concrete thing (λόγος τῆς οὐσίας). Only here, instead of assuming something immaterial (and therefore unverifiable), we fall back upon a current of air or gas (πνεῦμα); the essential reason of the thing is itself material, standing to it in the relation of a gaseous to a solid body. Here, too, the reason of things—that which accounts for them—is no longer some external end to which they are tending; it is something acting within them, "a spirit deeply interfused," germinating and developing as from a seed in the heart of each separate thing that exists (λόγος σπερματικός). By its prompting the thing grows, develops and decays, while this "germinal reason," the element of quality in the thing, remains constant through all its changes. (c) What then, we ask, is the relation between the active and the passive principles? Is there, or is there not, an essential distinction between substance or matter and pervading force or cause or quality? Here the Stoa shows signs of a development of doctrine. Zeno began, perhaps, by adopting the formulas of the Peripatetics, though no doubt with a conscious difference, postulating that form was always attached to matter, no less than matter, as known to us, is everywhere shaped or informed. Whether he ever overcame the dualism which the sources, such as they are, unanimously ascribe to him is not clearly ascertained. It seems probable that he did not. But we can answer authoritatively that to Cleanthes and Chrysippus, if not to Zeno, there was no real difference between matter and its cause, which is always a corporeal current, and therefore matter, although the finest and subtlest matter. In fact they have reached the final result of unveiled hylozoism, from which the distinction of the active and passive principles is discerned to be a merely formal concession to Aristotle, a legacy from his dualistic doctrine. His technical term Form (εἶδος) they never use, but always Reason or God. This was not the first time that approaches had been made to such a doctrine, and Diogenes of Apollonia in particular was led to oppose Anaxagoras, who distinguished Nous or Thought from every other agent within the cosmos which is its work by postulating as his first principle something which should be at once physical substratum and thinking being. But until dualism had been thought out, as in the Peripatetic school, it was impossible that monism (or at any rate materialistic monism) should be definitely and consciously maintained. One thing is certain: the Stoics provided no loophole of escape by entrenching upon the "purely material" nature of matter; they laid down with rigid accuracy its two chief properties—extension in three dimensions, and resistance, both being traced back to force. There were, it is true, certain inconsistent conceptions, creations of thought to which nothing real and external corresponded, namely, time, space, void, and the idea expressed in language (λεκτόν). But this inconsistency was covered by another: though each of these might be said to be something, they could not be said to exist.

Matter and Force.

Monism.

The distinction of force and matter is then something transitory and relative. Its history will serve as a sketch of the cosmogony of the Stoics, for they too, like earlier philosophers, have their "fairy tales of science." Before there was heaven or earth, there was primitive substance or Pneuma, the everlasting presupposition of particular things. This is the totality of all existence; out of it the whole visible universe proceeds, hereafter to be again resolved into it. Not the less is it the creative force, or deity, which develops and shapes this universal order or cosmos. To the question, What is God? Stoicism rejoins, What is God not? In this original state of Pneuma God and the world are absolutely identical. But even then tension, the essential attribute of matter, is at work. Though the force working everywhere is one, there are diversities of its operation, corresponding to various degrees of tension. In this primitive Pneuma there must reside the utmost tension and heat; for it is a fact of observation that most bodies expand when heated, whence we infer that there is a pressure in heat, an expansive and dispersive tendency. The Pneuma cannot long withstand this intense pressure. Motion backwards and forwards once set up goes to cool the glowing mass of fiery vapour and to weaken the tension. Hereupon follows the first differentiation of primitive substance—the separation of force from matter, the emanation of the world from God. The germinal world-making powers (σπερματικοὶ λόγοι), which, in virtue of its tension, slumbered in Pneuma, now proceed upon their creative task. The primitive substance, be it remembered, is not Heraclitus's fire (though Cleanthes also called it flame of fire, φλόξ) any more than it is the air or "breath" of Anaximenes or Diogenes of Apollonia. Chrysippus determined it, following Zeno, to be fiery breath or ether, a spiritualized sublimed intermediate element. The cycle of its transformations and successive condensations constitutes the life of the universe, the mode of existence proper to finite and particular being. For the universe and all its parts are only different embodiments and stages in that metamorphosis of primitive being which Heraclitus had called a progress up and down (ὁδὸς ἄνω κάτω). Out of it is separated, first, elemental fire, the fire which we know, which burns and destroys; and this, again, condenses into air or aerial vapour; a further step in the downward path derives water and earth from the solidification of air. At every stage the degree of tension requisite for existence is slackened, and the resulting element approaches more and more to "inert" matter. But, just as one element does not wholly pass over into another (e.g. only a part of air is transmuted into water or earth), so the Pneuma itself does not wholly pass over into the elements. The residue that remains in original purity with its tension yet undiminished is the ether in the highest sphere of the visible heavens, encircling the world of which it is lord and head. From the elements the one substance is transformed into the multitude of individual things in the orderly universe, which again is itself a living thing or being, and the Pneuma pervading it, and conditioning life and growth everywhere, is its soul. But this process of differentiation is not eternal; it continues only until the times of the restoration of all things. For the world which has grown up will in turn decay. The tension which has been relaxed will again be tightened; there will be a gradual resolution of things into elements, and of elements into the primary substance, to be consummated in a general conflagration when once more the world will be absorbed in God. Then in due order a new cycle of development begins, reproducing the last in every minutest detail, and so on for ever.

Cosmogony.

The doctrine of Pneuma, vital breath or "spirit," arose in the medical schools. The simplest reflection among savages and half-civilized men connects vitality with the air inhaled in respiration; the disciples of Hippocrates, without much modifying this primitive belief, explained the maintenance of vital warmth to be the function of the breath within the organism. In the time of Alexander the Great Praxagoras discovered the distinction between the arteries and the veins. Now in the corpse the former are empty; hence, in the light of these preconceptions they were declared to be vessels for conveying Pneuma to the different parts of the body. A generation afterwards Erasistratus made this the basis of a new theory of diseases and their treatment. Vital spirit, inhaled from the outside air, rushes through the arteries till it reaches the various centres, especially the brain and the heart, and there causes thought and organic movement. But long before this the peculiar character of air had been recognized as something intermediate to the corporeal and the incorporeal: when Diogenes of Apollonia revived the old Ionian hylozoism in opposition to the dualism of Anaxagoras, he made this, the typical example of matter in the gaseous state, his one element. In Stoicism, for the moment, the two conceptions are united, soon, however, to diverge—the medical conception to receive its final development under Galen, while the philosophical conception, passing over to Philo and others, was shaped and modified at Alexandria under the influence of Judaism, whence it played a great part in the developments of Jewish and Christian theology.

Pneuma.

The influence upon Stoicism of Heraclitus has been differently conceived. Siebeck would reduce it within very small dimensions, but this is not borne out by the concise history found at Herculaneum (*Index herc.*, ed. Comparetti, col. 4 seq.). They substituted primitive Pneuma for his primitive fire, but so far as they are hylozoists at all they stand upon the same ground with him. Moreover, the commentaries of Cleanthes, Aristo and Sphaerus on Heraclitean writings (Diog. Laër. vii. 174, ix. 5, 15) point to common study of these writings under Zeno. Others again (*e.g.* Lassalle) represent the Stoics as merely diluting and distorting Heracliteanism. But this is altogether wrong, and the proofs offered, when rightly sifted, are often seen to rest upon the distortion of Heraclitean doctrine in the reports of later writers, to assimilate it to the better known but essentially distinct innovations of the Stoics. In Heraclitus the constant flux is a metaphysical notion replaced by the interchange of material

Contrast to Heraclitus.

elements which Chrysippus stated as a simple proposition of physics. Heraclitus offers no analogy to the doctrine of four (not three) elements as different grades of tension; to the conception of fire and air as the "form," in Aristotelian terminology, of particulars; nor to the function of organizing fire which works by methodic plan to produce and preserve the world (πῦρ τεχνικὸν ὁδῷ βαδίζον ἐπὶ γένεσιν κόσμου). Nor, again, is there any analogy to the peculiar Stoic doctrine of universal intermingling (κρᾶσις δι' ὅλου). The two active elements interpenetrate the two lower or more relaxed, winding through all parts of matter and so pervading the greater masses that there is no mechanical mixture, nor yet a chemical combination, since both "force" and "matter" retain their relative characters as before. Even the distinction between "force" and "matter"—so alien to the spirit of Heraclitus—is seen to be a necessary consequence. Once assume that every character and property of a particular thing is determined solely by the tension in it of a current of Pneuma, and (since that which causes currents in the thing cannot be absolutely the same with the thing itself) Pneuma, though present in all things, must be asserted to vary indefinitely in quantity and intensity. So condensed and coarsened is the indwelling air-current of inorganic bodies that no trace of elasticity or life remains; it cannot even afford them the power of motion; all it can do is to hold them together (συνεκτικὴ δύναμις), and, in technical language, Pneuma is present in stone or metal as a retaining principle (ἕξις = hold), explaining the attributes of continuity and numerical identity (συνεχῆ καὶ ἡνωμένα) which even these natural substances possess. In plants again and all the vegetable kingdom it is manifest as something far purer and possessing greater tension, called a "nature," or principle of growth (φύσις). Further, a distinction was drawn between irrational animals, or the brute creation, and the rational, *i.e.* gods and men, leaving room for a divergence, or rather development, of Stoic opinion. The older authorities conceded a vital principle, but denied a soul, to the brutes: animals, they say, are ζῷα but not ἔμψυχα. Later on much evidence goes to show that (by a divergence from the orthodox standard perhaps due to Platonic influence) it was a Stoic tenet to concede a soul, though not a rational soul, throughout the animal kingdom. To this higher manifestation of Pneuma can be traced back the "esprits animaux" of Descartes and Leibnitz, which continue to play so great a part even in Locke. The universal presence of Pneuma was confirmed by observation. A certain warmth, akin to the vital heat of organic being, seems to be found in inorganic nature: vapours from the earth, hot springs, sparks from the flint, were claimed as the last remnant of Pneuma not yet utterly slackened and cold. They appealed also to the velocity and dilatation of aeriform bodies, to whirlwinds and inflated balloons. The Logos is quick and powerful, and sharper than any two-edged sword, piercing even to the dividing asunder of the joints and marrow. Tension itself Cleanthes defined as a fiery stroke (πληγὴ πυρός); in his hymn to Zeus lightning is the symbol of divine activity. Take the fundamental properties of body—extension and resistance. The former results from distance; but distances, or dimensions, are straight lines, *i.e.* lines of greatest tension (εἰς ἄκρον τεταμένη). Tension produces dilatation, or increase in distance. Resistance, again, is explained by cohesion, which implies binding force. Again, the primary substance has rectilinear motion in two directions, backwards and forwards, at once a condensation, which produces cohesion and substance, and a dilatation, the cause of extension and qualities. How near this comes to the scientific truth of attraction and repulsion need hardly be noted. From the astronomers the Stoics borrowed their picture of the universe—a *plenum* in the form of a series of layers or concentric rings, first the elements, then the planetary and stellar spheres, massed round the earth as centre—a picture which dominated the imagination of men from the days of Eudoxus down to those of Dante or even Copernicus. As to the physical constitution of bodies, they were content to reproduce the Peripatetic doctrine with slight modifications in detail, of hardly any importance when compared with the change of spirit in the doctrine taught. But they rarely prosecuted researches in physics or astronomy, and the newly created sciences of biology and comparative anatomy received no adequate recognition from them.

Psychology.

If, however, in the science of nature the Stoics can lay claim to no striking originality, the case is different when we come to the science of man. In the rational creatures—man and the gods—Pneuma is manifested in a high degree of purity and intensity as an emanation from the world-soul, itself an emanation from the primary substance of purest ether—a spark of the celestial fire, or, more accurately, fiery breath, which is a mean between fire and air, characterized by vital warmth more than by dryness. The physical basis of Stoic psychology deserves the closest attention. On the one hand, soul is corporeal, else it would have no real existence, would be incapable of extension in three dimensions (and therefore of equable diffusion all over the body), incapable of holding the body together, as the Stoics contended that it does, herein presenting a sharp contrast to the Epicurean tenet that it is the body which confines and shelters the light vagrant atoms of soul. On the other hand, this corporeal thing is veritably and identically reason, mind, and ruling principle (λόγος, νοῦς, ἡγεμονικόν); in virtue of its divine origin Cleanthes can say to Zeus, "We too are thy offspring," and a Seneca can calmly insist that, if man and God are not on perfect equality, the superiority rests rather on our side. What God is for the world that the soul is for man. The Cosmos must be conceived as a single whole, its variety being referred to varying stages of condensation in Pneuma. So, too, the human soul must possess absolute simplicity, its varying functions being conditioned by the degrees or species of its tension. It follows that of "parts" of the soul, as previous thinkers imagined, there can be no question; all that can consistently be maintained is that from the centre of the body—the heart—seven distinct air-currents are discharged to various organs, which are so many modes of the one soul's activity.[1] The ethical consequences of this position will be seen at a later stage. With this psychology is intimately connected the Stoic theory of knowledge.

Theory of Knowledge.

From the unity of soul it follows that all psychical processes—sensation, assent, impulse—proceed from reason, the ruling part; that is to say, there is no strife or division: the one rational soul alone has sensations, assents to judgments, is impelled towards objects of desire just as much as it thinks or reasons. Not that all these powers at once reach full maturity. The soul at first is void of content; in the embryo it has not developed beyond the nutritive principle of a plant (φύσις): at birth the "ruling part" is a blank tablet, although ready prepared to receive writing. This excludes all possibility of innate ideas or any faculty akin to intuitive reason. The source of all our knowledge is experience and discursive thought, which manipulates the materials of sense. Our ideas are copied from stored-up sensations. No other theory was possible upon the foundation of the Stoic physics.

Note the parallel between the macrocosm and the microcosm. The soul of the world fills and penetrates it: in like manner the human soul pervades and breathes through all the body, informing and guiding it, stamping the man with his essential character of rational. There is in both alike a ruling part, though this is situate in the human heart at the centre—not in the brain, as the analogy of the celestial ether would suggest. Finally, the same cause, a relaxation of tension, accounts for sleep, decay and death of man and for the dissolution of the world; after death the disembodied soul can only maintain its separate existence, even for a limited time, by mounting to that region of the universe which is akin to its nature. It was a moot point whether all souls so survive, as Cleanthes thought, or the souls of the wise and good alone, which was the opinion of Chrysippus; in any case, sooner or later individual souls are merged in the soul of the universe, from which they proceeded. The relation of the soul of the universe to God is quite clear: it is an inherent property, a mode of His activity, an effluence or emanation from the fiery ether which surrounds the universe, penetrating and permeating it. A Stoic might consistently maintain that World-Soul, Providence, Destiny and Germinal Reason are not mere synonyms, for they express different aspects of God, different relations of God to things. We find ourselves on the verge of a system of abstractions, or "attributes turned into entities," as barren as any excogitated in medieval times. In a certain sense, Scholasticism began with Chrysippus. To postulate different substances as underlying the different forces of nature would have been to surrender the fundamental thought of the system. What really *is*—the Pneuma—neither increases nor diminishes; but its modes of working, its different currents, can be conveniently distinguished and enumerated as evidence of so many distinct attributes.

Perception.

One inevitable consequence of materialism is that subject and object can no longer be regarded as one in the act of perception, as Plato and Aristotle tended to assume, however imperfectly the assumption was carried out. The presumption of some merely external connexion, as between any other two corporeal things, is alone admissible and some form of the

[1] These derivative powers include the five senses, speech and the reproductive faculty, and they bear to the soul the relation of qualities to a substance. The ingenious essay of Mr R. D. Archer Hind on the Platonic psychology (*Journ. of Phil.* x. 120) aims at establishing a parallel unification on the spiritualistic side; cf. *Rep.* x. 612 A.

representative hypothesis is most easily ealled in to account for perception. The Stoics explained it as a transmission of the pereeived quality of the object, by means of the sense organ, into the percipient's mind, the quality transmitted appearing as a disturbance or impression upon the corporeal surface of that "thinking thing," the soul. Sight is taken as the typical sense. A conical pencil of rays diverges from the pupil of the eye, so that its base covers the object seen. In sensation a presentation is conveyed, by an air-current, from the sense organ, here the eye, to the mind, *i.e.* the soul's "ruling part" in the breast; the presentation, besides attesting its own existence, gives further information ot its object—visible colour or size, or whatever be the quality in the thing seen. That Zeno and Cleanthes crudely compared this presentation to the impression which a seal bears upon wax, with protuberances and indentations, while Chrysippus more prudently determined it vaguoly as an occult modification or "mode" of mind, is an interesting but not intrinsically important detail But the mind is no mere passive recipient ot impressions from without, in the view of the Stoics. Their analysis of sensation supposes it to react, by a variation in tension, against the current from the sense-organ; and this is the mind's assent or dissent, which is inseparable from the sense presentation. The contents of experience are not all alike true or valid: hallucination is possible; here the Stoics join issue with Epicurus. It is necessary, therefore, that assent should not be given indiscriminately; we must determine a criterion of truth, a special formal test whereby reason may recognize the merely plausible and hold fast the true. In an earlier age such an inquiry would have seemed superfluous. To Plato and Aristotle the nature and operation of thought and reason constitute a sufficient criterion. Since their day not only had the opposition between sense and reason broken down, but the reasoned scepticism of Pyrrho and Arcesilaus had made the impossibility of attaining truth the primary condition of well-being Yet the standard which ultimately found acceptance in the Stoic school was not put forward, in that form, by its founder. Zeno, we have reason to believe, adopted the Cynic Logos for his guidance to truth as well as to morality. As a disciple of the Cynics he must have started with a theory of knowledge somewhat like that developed in the third part of Plato's *Theaetetus* (201 C seq.)—that simple ideas are given by sense, whereas "opinion," which is a complex of simple ideas, only beeomes knowledge when joined with Logos. We may further suppose that the more obvious of Plato's objections had led to the correction of "reason" into "right reason." However that may be, it is certain from Aristotle (*Nic. Eth.* vi. 13, 1144b, 17) that virtue was defined as a "habit" in accordance with right reason, and from Diog. Laër. vii. 54 that the earlier Stoics made right reason the standard of truth. The law which regulates our action is thus the ultimate criterion of what we know—practical knowledge being understood to be of paramount importance. But this criterion was open to the persistent attacks of Epicureans and Academics, who made clear (1) that reason is dependent upon, if not derived from, sense, and (2) that the utterances of reason lack consistency. Chrysippus, therefore, conceded something to his opponents when he substituted for the Logos the new standards of sensation (αἴσθησις) and general conception (πρόληψις = anticipation, *i.e.* the generic type formed in the mind unconsciously and spontaneously). At the same time he was more clearly defining and safeguarding his predeeessors' position. For reason is consistent in the general conceptions wherein all men agree, because in all alike they are of spontaneous growth. Nor was the term sensation sufficiently definite. The same Chrysippus fixed upon a certain characteristic of true presentations, which he denoted by the much disputed term "apprehensive" (καταληπτικὴ φαντασία). Provided the sense organ and the mind be healthy, provided an external object be really seen or heard, the presentation, in virtue of its clearness and distinctness, has the power to extort the assent which it always lies in our power to give or to withhold.

Criterion of Truth.

Formerly this technical phrase was explained to mean "the perception which irresistibly compels the subject to assent to it as true." But this, though apparently supported by Sextus Empiricus (*Adv. Math.* vii. 257), is quite erroneous; for the presentation is called καταληπτόν, as well as καταληπτικὴ φαντασία, so that beyond all doubt it is something which the percipient subject grasps, and not that which grasps or "lays hold of" the percipient. Nor, again, is it wholly satisfactory to explain καταληπτική as virtually passive, "apprehensible," like its opposite ἀκατάληπτος; for we find ἀντιληπτικὴ τῶν ὑποκειμένων used as an alternative phrase (ibid. vii. 248). It would seem that the perception intended to constitute the standard of truth is one which, by producing a mental counterpart of a really existent external thing, enables the percipient, in the very act of sense, to "lay hold of" or apprehend an object in virtue of the presentation or sense impression of it excited in his own mind. The reality of the external object is a necessary condition, to exclude hallucinations of the senses; the exact correspondence between the external object and the internal percept is also necessary, but naturally hard to secure, for how can we compare the two? The external object is known only in perception. However, the younger Stoics endeavoured to meet the assaults of their persistent eritic Carneades by suggesting various modes of testing a single presentation, to see whether it were consistent with others, especially such as occurred in groups, &c.; indeed, some went so far as to add to the definition "coming from a real object and exactly corresponding with it" the clause "provided it encounter no obstacle."

The same criterion was available for knowledge derived more directly from the intellect. Like all materialists, the Stoics can only distinguish the sensible from the intelligible as thinking when the external object is present (αἰσθάνεσθαι) and thinking when it is absent (ἐννοεῖν) The product of the latter kind includes memory (though this is, upon a strict analysis, something intermediate), and conceptions or general notions, under which were confusedly classed the products of the imaginative faculty. The work of the mind is seen first in "assent"; if to a true presentation the result is "simple apprehension" (κατάληψις: this stands in close relation to the καταληπτικὴ φαντασία, of which it is the necessary complement); if to a false or unapprehensive presentation, the result is "opinion" (δόξα), always deprecated as akin to error and ignorance, unworthy of a wise man. These processes are conceivable only as "modes" of mind, changes in the soul's substance, and the same is true of the higher conceptions, the products of generalization. But the Stoics were not slow to exalt the part of reason, which seizes upon the generic qualities, the essential nature of things. Where sense and reason conflict, it is the latter that must decide. One isolated "apprehension," however firm its grasp, does not constitute knowledge or science (ἐπιστήμη); it must be of the firmest, such as reason cannot shake, and, further, it must be worked into a system of such apprehensions which can only be by the mind's exercising the "habit" (ἕξις) of attaining truth by continuous tension. Here the work of reason is assimilated to the force which binds together the parts of an inorganic body and resists their separation. There is nothing more in the order of the universe than extended mobile bodies and forces in tension in these bodies. So, too, in the order of knowledge there is nothing but sense and the force of reason maintaining its tension and connecting sensations and ideas in their proper sequence. Zeno compared sensation to the outstretched hand, flat and open; bending the fingers was assent; the clenched fist was "simple apprehension," the mental grasp of an object; knowledge was the clenched fist tightly held in the other hand. The illustration is valuable for the light it throws on the essential unity of diverse intellectual operations as well as for enforcing once more the Stoic doctrine that different grades of knowledge are different grades of tension. Good and evil, virtues and vices, remarks Plutarch, are all capable of being "perceived"; sense, this common basis of all mental activity, is a sort of touch by which the ethereal Pneuma which is the soul's substance recognizes and measures tension.

Degrees of Knowledge.

With this exposition we have already invaded the province of logic. To this the Stoics assigned a miscellany of studies—rhetoric, dialectic, including grammar, in addition to formal logic—to all of which their industry made contributions. Some of their innovations in grammatical terminology have lasted until now: we still speak of oblique cases, genitive, dative, accusative, of verbs active (ὀρθά), passive (ὕπτια), neuter (οὐδέτερα), by the names they gave. Their corrections and fancied improvements of the Aristotelian logic are mostly useless and pedantic. Judgment (ἀξίωμα) they defined as a complete idea capable of expression in language (λεκτὸν αὐτοτελές), and to distinguish it from other enunciations, as a wish or a command, they added "which is either true or false." From simple judgments they proceeded to compound judgments, and declared the hypothetical syllogism to be the normal type of reason, of which the categorical syllogism is an abbreviation. Perhaps it is worth while to quote their treatment of the categories. Aristotle made ten, all co-ordinate, to serve as "heads of predication" under which to collect distinct scraps of information respecting a subject, probably a man. For this the Stoics substituted four *summa genera*, all subordinate, so that each in turn is more precisely determined by the next. They are Something, or Being, determined as (1) substance or subject matter, (2) essential quality, *i.e.* substance qualified, (3) mode or chance attribute, *i.e.* qualified substance in a certain condition (πως ἔχον), and, lastly, (4) relation or relative mode (in full ὑποκείμενον ποιὸν πρός τί πως ἔχον). The zeal with which the school prosecuted logical inquiries had one practical result—they could use to perfection the unrivalled weapon of analysis. Its chief employment was to lay things bare and sever them from their surroundings, in order that they might be contemplated in their simplicity, with rigid exactness, as objects of thought, apart from the illusion and exaggeration that attends them when presented to sense and imagination. The very perfection and precision of this method constantly tempted the later Stoics to abuse it for the systematic depreciation of the objects analysed.

Logic.

The ethical theory of the Stoics stands in the closest connexion with their physics, psychology and cosmology. A critical account of it will be found in the article ETHICS. It may be briefly summarized here. Socrates had rightly said that Virtue is Knowledge, but he had not definitely shown in what this knowledge consists, nor had his immediate successors, the Cynics, made any serious attempt to solve the difficulty. The Stoics not only drew up an elaborate scheme of duties, but also crystallized their theory in a general law, namely that true goodness

Ethics.

lies in the knowledge of nature and is obtained by the exercise of Reason. The most elementary part of nature is pure ether, which is possessed of divine reason. This Reason even non-rational man unconsciously manifests in his mechanical or instinctive actions which tend to the preservation of himself. The truly wise man will therefore live as much as possible in conformity with nature, (*i.e.* nature uncorrupted by the errors of society), and, though as an individual and part of the whole not master of his fate, will yet have self-control even in the midst of misfortune and pain. All evil passion is due to erroneous judgment and morbid conditions of mind which may be divided into chronic ailments (νοσήματα) and infirmities (ἀρρωστήματα), *i.e.* into permanent or temporary disorders. In contrast to the Cyrenaics and the Epicureans, the Stoics denied that pleasure is actually or ought to be the object of human activity. The non-rational man aims at self-preservation, and the wise man will imitate him deliberately, and when he fails he will suffer with equanimity. To him the so-called "goods" (*e.g.* health, wealth, &c.) are "indifferent" (ἀδιάφορα); since he must live, he will exercise his reasoning faculty upon them, and will regard some as "preferred" (προηγμένα) and others as to be "rejected" (ἀποπροηγμένα), but he will not regard either class as possessed of an intrinsic value. The end of action is, therefore, a harmonious consistent life "according to nature" and (cf. Heraclitus) an ordered unity of action. Virtue is its own good; the highest exercise of reason is its own perfection. It follows (1) that pleasure, being quite outside the pale is not the object but merely an ἐπιγέννημα (accompaniment) of virtuous action, and (2) that there is, within the circle of virtue, no degree. An action is simply virtuous or not; it cannot be more or less virtuous. The result of this theory of ethics is of great value as emphasizing the importance of a systematic view of conduct, but it fails to resolve satisfactorily the great Socratic paradox that evil is the result of ignorance. For even though they attempt to substantiate the idea of responsibility by maintaining that ignorance is voluntary, they cannot find any answer to the question whether some men may not be without the capacity to choose learning (but see ETHICS: *History*, § Stoics).

Cosmopolitanism.

In their view of man's social relations the Stoics are greatly in advance of preceding schools. We saw that virtue is a law which governs the universe: that which Reason and God ordain must be accepted as binding upon the particle of reason which is in each one of us. Human law comes into existence when men recognize this obligation; justice is therefore natural and not something merely conventional. The opposite tendencies, to allow to the individual responsibility and freedom, and to demand of him obedience to law, are both features of the system; but in virtue even of the freedom which belongs to him *qua* rational, he must recognize the society of rational beings of which he is a member, and subordinate his own ends to the ends and needs of this society. Those who own one law are citizens of one state, the city of Zeus, in which men and gods have their dwelling. In that city all is ordained by reason working intelligently, and the members exist for the sake of one another; there is an intimate connexion (συμπάθεια) between them which makes all the wise and virtuous friends, even if personally unknown, and leads them to contribute to one another's good. Their intercourse should find expression in justice, in friendship, in family and political life. But practically the Stoic philosopher always had some good excuse for withdrawing from the narrow political life of the city in which he found himself. The circumstances of the time, such as the decay of Greek city-life, the foundation of large territorial states under absolute Greek rulers which followed upon Alexander's conquests, and afterwards the rise of the world-empire of Rome, aided to develop the leading idea of Zeno's *Republic*. There he had anticipated a state without family life, without law courts or coins, without schools or temples, in which all differences of nationality would be merged in the common brotherhood of man. This cosmopolitan citizenship remained all through a distinctive Stoic dogma; when first announced it must have had a powerful influence upon the minds of men, diverting them from the distractions of almost parochial politics to a boundless vista. There was, then, no longer any difference between Greek and barbarian, between male and female, bond and free. All are members of one body as partaking in reason, all are equally men. Not that this led to any movement for the abolition of slavery. For the Stoics attached but slight importance to external circumstances, since only the wise man is really free, and all the unwise are slaves. Yet, while they accepted slavery as a permanent institution, philosophers as wide apart as Chrysippus and Seneca sought to mitigate its evils in practice, and urged upon masters humanity in the treatment of their slaves.

Religion.

The religious problem had peculiar interest for the school which discerned God everywhere as the ruler and upholder, and at the same time the law, of the world that He had evolved from Himself. The physical groundwork lends a religious sanction to all moral duties, and Cleanthes's noble hymn is evidence how far a system of natural religion could go in providing satisfaction for the cravings of the religious temper:—

"Most glorious of immortals, O Zeus of many names, almighty and everlasting, sovereign of nature, directing all in accordance with law, thee it is fitting that all mortals should address. . . . Thee all this universe, as it rolls circling round the earth, obeys wheresoever thou dost guide, and gladly owns thy sway. Such a minister thou holdest in thy invincible hands—the two-edged, fiery, everliving thunderbolt, under whose stroke all nature shudders. No work upon earth is wrought apart from thee, lord, nor through the divine ethereal sphere, nor upon the sea; save only whatsoever deeds wicked men do in their own foolishness. Nay, thou knowest how to make even the rough smooth, and to bring order out of disorder; and things not friendly are friendly in thy sight. For so hast thou fitted all things together, the good with the evil, that there might be one eternal law over all. . . . Deliver men from fell ignorance. Banish it, father, from their soul, and grant them to obtain wisdom, whereon relying thou rulest all things with justice."

To the orthodox theology of Greece and Rome the system stood in a twofold relation, as criticism and rationalism. That the popular religion contained gross errors hardly needed to be pointed out. The forms of worship were known to be trivial or mischievous, the myths unworthy or immoral. But Zeno declared images, shrines, temples, sacrifices, prayers and worship to be of no avail. A really acceptable prayer, he taught, can only have reference to a virtuous and devout mind: God is best worshipped in the shrine of the heart by the desire to know and obey Him. At the same time the Stoics felt at liberty to defend and uphold the truth in polytheism. Not only is the primitive substance God, the one supreme being, but divinity must be ascribed to His manifestations—to the heavenly bodies, which are conceived, like Plato's created gods, as the highest of rational beings, to the forces of nature, even to deified men; and thus the world was peopled with divine agencies. Moreover, the myths were rationalized and allegorized, which was not in either case an original procedure. The search for a deeper hidden meaning beside the literal one had been begun by Democritus, Empedocles, the Sophists and the Cynics. It remained for Zeno to carry this to a much greater extent and to seek out or invent "natural principles" (λόγοι φυσικοί) and moral ideas in all the legends and in the poetry of Homer and Hesiod. In this sense he was the pattern if not the "father" of all such as allegorize and reconcile. Etymology was pressed into the service, and the wildest conjectures as to the meaning of names did duty as a basis for mythological explanations. The two favourite Stoic heroes were Hercules and Ulysses, and nearly every scene in their adventures was made to disclose some moral significance.

Divination.

Lastly, the practice of divination and the consultation of oracles afforded a means of communication between God and man—a concession to popular beliefs which may be explained when we reflect that to the faithful divination was something as essential as confession and spiritual direction to a devout Catholic now, or the study and interpretation of Scripture texts to a Protestant. Chrysippus did his best to reconcile the superstition with his own rational doctrine of strict causation. Omens and portents, he explained, are the natural symptoms of certain occurrences. There must be countless indications of the course of Providence, for the most part unobserved, the meaning of only a few having become known to men. His opponents argued, "if all events are foreordained, divination is superfluous"; he replied that both divination and our behaviour under the warnings which it affords are included in the chain of causation. Even here, however, the bent of the system is apparent. They were at pains to insist upon purity of heart and life as an indispensable condition for success in prophesying and to enlist piety in the service of morality.

When Chrysippus died (Ol. 143 = 208–204 B.C.) the structure of Stoic doctrine was complete. With the Middle Stoa we enter upon a period at first of comparative inaction, afterwards of internal reform. Chrysippus's immediate successors were Zeno of Tarsus, Diogenes of Seleucia (often called the Babylonian) and Antipater of Tarsus, men of no originality, though not without ability; the two last-named, however, had all their energies taxed to sustain the conflict with Carneades (*q.v.*). This was the most formidable assault the school ever encountered; that it survived was due more to the foresight and elaborate precautions of Chrysippus than to any efforts of that "pen-doughty" pamphleteer, Antipater (καλαμοβόας), who shrank from opposing himself in person to the eloquence of Carneades. The subsequent history testified to the importance of this controversy. The special objects of attack were the Stoic theory of knowledge, their theology and their ethics. The physical basis of the system remained unchanged but neglected; all creative force or even original research in the departments of physics and metaphysics vanished. Yet problems of interest bearing upon psychology and natural theology continued to be discussed. Thus the cycles of the world's existence, and the universal conflagration which terminates each of them, excited some doubt. Diogenes of Seleucia is said to have wavered in his belief at last; Boethus, one of his pupils, flatly denied it. He regarded the Deity as the guide and upholder of the world, watching over it from the outside, not as the immanent soul within it, for according to him the world was as soulless as a plant. We have here a compromise between Zeno's and Aristotle's doctrines. But in the end the universal conflagration was handed down without question as an article of belief. It is clear that the activity of these teachers was chiefly directed to ethics: they elaborated fresh definitions of the chief good, designed either to make yet clearer the sense of the formulas of Chrysippus or else to meet the more urgent objections of the New Academy. Carneades had emphasized one striking apparent inconsistency: it had been laid down that to choose what is natural is man's highest good, and yet the things chosen, the "first objects according to nature," had no place amongst goods. Antipater may have met this by distinguishing "the attainment" of primary natural ends from the activity directed to their attainment (Plut. *De Comm. Not.* 27, 14, p. 1072 F); but, earlier still, Diogenes had put forward his gloss, viz. "The end is to calculate rightly in the selection and rejection of things according to nature." Archedemus, a contemporary of Diogenes, put this in plainer terms still: "The end is to live in the performance of all fitting actions" (πάντα τὰ καθήκοντα ἐπιτελοῦντας ζῆν). Now it is highly improbable that the earlier Stoics would have sanctioned such interpretations of their dogmas. The mere performance of relative or imperfect duties, they would have said, is something neither good nor evil; the essential constituents of human good is ignored. And similar criticism is actually passed by Posidonius: "This is not the end, but only its necessary concomitant; such a mode of expression may be useful for the refutation of objections put forward by the Sophists" (Carneades and the New Academy?), "but it contains nothing of morality or well-being" (Galen, *De Plac. Hipp. et Plat.* p. 470 K). There is every ground, then, for concluding that we have here one concession extorted by the assaults of Carneades. For a similar compromise there is express testimony: "good repute" (εὐδοξία) had been regarded as a thing wholly indifferent in the school down to and including Diogenes. Antipater was forced to assign to it "positive value," and to give it a place amongst "things preferred" (Cic. *De fin.* iii. 57). These modifications were retained by Antipater's successors. Hence come the increased importance and fuller treatment which from this time forward fall to the lot of the "external duties" (καθήκοντα). The rigour and consistency of the older system became sensibly modified.

Middle Stoa.

To this result another important factor contributed. In all that the older Stoics taught there breathes that enthusiasm for righteousness in which has been traced the earnestness of the Semitic spirit; but nothing presents more forcibly the pitch of their moral idealism than the doctrine of the Wise Man. All mankind fall into two classes—the wise or virtuous, the unwise or wicked—the distinction being absolute. He who possesses virtue possesses it whole and entire; he who lacks it lacks it altogether. To be but a hand's-breadth below the surface of the sea ensures drowning as infallibly as to be five hundred fathoms deep. Now the wise man is drawn as perfect. All he does is right, all his opinions are true; he alone is free, rich, beautiful, skilled to govern, capable of giving or receiving a benefit. And his happiness, since length of time cannot increase it, falls in nothing short of that of Zeus. In contrast with all this, we have a picture of universal depravity. Now, who could claim to have attained to the sage's wisdom? Doubtless, at the first founding of the school Zeno himself and Zeno's pupils were inspired with this hope; they emulated the Cynics Antisthenes and Diogenes, who never shrank out of modesty from the name and its responsibilities. But the development of the system led them gradually and reluctantly to renounce this hope as they came to realize the arduous conditions involved. Zeno indeed could hardly have been denied the title conferred upon Epicurus. Cleanthes, the "second Hercules," held it possible for man to attain to virtue. From anecdotes recorded of the tricks played upon Aristo and Sphaerus (Diog. Laër. vii. 162, 117) it may be inferred that the former deemed himself infallible in his opinions, *i.e.* set up for a sage; Persaeus himself, who had exposed the pretensions of Aristo, is twitted with having failed to conform with the perfect generalship which was one trait of the wise man when he allowed the citadel of Corinth to be taken by Aratus (Athen. iv. 102 D). The trait of infallibility especially proved hard to establish when successive heads of the school seriously differed in their doctrine. The prospect became daily more distant, and at length faded away. Chrysippus declined to call himself or any of his contemporaries a sage. One or two such manifestations there may have been—Socrates and Diogenes?—but the wise man was rarer, he thought, than the phoenix. If his successors allowed one or two more exceptions, to Diogenes of Seleucia at any rate the sage was an unrealized ideal, as we learn from Plutarch (*De comm. not.* 33, 1076 B), who does not fail to seize upon this extreme view. Posidonius left even Socrates, Diogenes and Antisthenes in the state of progress towards virtue.

The Sage.

Although there was in the end a reaction from this extreme, yet it is impossible to mistake the bearing of all this upon a practical system of morals. So long as dialectic subtleties and exciting polemics afforded food for the intellect, the gulf between theory and practice might be ignored. But once let this system be presented to men in earnest about right living, and eager to profit by what they are taught, and an ethical reform is inevitable. Conduct for us will be separated from conduct for the sage. We shall be told not always to imitate him. There will be a new law, dwelling specially upon the "external duties" required of all men, wise or unwise; and even the sufficiency of virtue for our happiness may be questioned. The introducer and expositor of such a twofold morality was a remarkable man. Born at Rhodes *c.* 185 B.C., a citizen of the most flourishing of Greek states and almost the only one which yet retained vigour and freedom, Panaetius lived for years in the house of Scipio Africanus the younger at Rome, accompanied him on embassies and campaigns, and was perhaps the first Greek who in a private capacity had any insight into the working of the Roman state or the character of its citizens. Later in life, as head of the Stoic school at Athens, he achieved a reputation second only to that of Chrysippus. He is the earliest Stoic author from whom we have, even indirectly, any considerable piece of work, as books i. and ii. of the *De officiis* are a *réchauffé*, in Cicero's

Modifications in Practice.

fashion, of Panaetius "Upon External Duty" (περὶ τοῦ καθήκοντος).

The introduction of Stoicism at Rome was the most momentous of the many changes that it saw. After the first sharp collision with the jealousy of the national authorities it found a ready acceptance, and made rapid progress amongst the noblest families. It has been well said that the old heroes of the republic were unconscious Stoics, fitted by their narrowness, their stern simplicity and devotion to duty for the almost Semitic earnestness of the new doctrine. In Greece its insensibility to art and the cultivation of life was a fatal defect; not so with the shrewd men of the world, desirous of qualifying as advocates or jurists. It supplied them with an incentive to scientific research in archaeology and grammar; it penetrated jurisprudence until the belief in the ultimate identity of the *jus gentium* with the law of nature modified the praetor's edicts for centuries. Even to the prosaic religion of old Rome, with its narrow original conception and multitude of burdensome rites, it became in some sort a support. Scaevola, following Panaetius, explained that the prudence of statesmen had established this public institution in the service of order midway between the errors of popular superstition and the barren truths of enlightened philosophy. Soon the influence of the pupils reacted upon the doctrines taught. Of speculative interest the ordinary Roman had as little as may be; for abstract discussion and controversy he cared nothing. Indifferent to the scientific basis or logical development of doctrines, he selected from various writers and from different schools what he found most serviceable. All had to be simplified and disengaged from technical subtleties. To attract his Roman pupils Panaetius would naturally choose simple topics susceptible of rhetorical treatment or of application to individual details. He was the representative, not merely of Stoicism, but of Greece and Greek literature, and would feel pride in introducing its greatest masterpieces: amongst all that he studied, he valued most the writings of Plato. He admired the classic style, the exquisite purity of language, the flights of imagination, but he admired above all the philosophy. He marks a reaction of the genuine Hellenic spirit against the narrow austerity of the first Stoics. Zeno and Chrysippus had introduced a repellent technical terminology; their writings lacked every grace of style. With Panaetius the Stoa became eloquent: he did his best to improve upon the uncouth words in vogue, even at some slight cost of accuracy, *e.g.* to discard προηγμένον for εὔχρηστον, or else designate it "so-called good," or even simply "good," if the context allowed.

Stoicism in Rome.

Panaetius.

The part Panaetius took in philological and historical studies is characteristic of the man. We know much of the results of these studies; of his philosophy technically we know very little. He wrote only upon ethics, where historical knowledge would be of use. Crates of Mallus, one of his teachers, aimed at fulfilling the high functions of a "critic" according to his own definition—that the critic must acquaint himself with all rational knowledge. Panaetius was competent to pass judgment upon the critical "divination" of an Aristarchus (who was perhaps himself also a Stoic), and took an interest in the restoration of Old Attic forms to the text of Plato. Just then there had been a movement towards a wider and more liberal education, by which even contemporary Epicureans were affected. Diogenes the Babylonian had written a treatise on language and one entitled *The Laws*. Along with grammar, which had been a prominent branch of study under Chrysippus, philosophy, history, geography, chronology and kindred subjects came to be recognized as fields of activity no less than philology proper. It has been recently established that Polybius the historian was a Stoic, and it is clear that he was greatly influenced by the form of the system which he learned to know, in the society of Scipio and his friends, from Panaetius.[1] Nor is it improbable that works of the latter served Cicero as the originals of his *De republica* and *De legibus*.[2] Thus the gulf between Stoicism and the later Cynics, who were persistently hostile to culture, could not fail to be widened.

[1] Hirzel, *Untersuch.* ii. 841 seq. Polybius's rejection of divination is decisive. See, *e.g.* his explanation upon natural causes of Scipio the Elder's capture of New Carthage, "by the aid of Neptune," x. 11 (cf. x. 2). F. Voigt holds that in vi. 5, 1, τισιν ἑτέροις τῶν φιλοσόφων is an allusion to Panaetius.

[2] This at least, is maintained by Schmekel.

A wave of eclecticism passed over all the Greek schools in the 1st century B.C. Platonism and scepticism had left undoubted traces upon the doctrine of such a reformer as Panaetius. He had doubts about a general conflagration; possibly (he thought) Aristotle was right in affirming the eternity of the present order of the world. He doubted the entire system of divination. On these points his disciples Posidonius and Hecato seem to have reverted to orthodoxy. But in ethics his innovations were more suggestive and fertile. He separated wisdom as a theoretic virtue from the other three which he called practical. Hecato slightly modified this: showing that precepts (θεωρήματα) are needed for justice and temperance also, he made them scientific virtues, reserving for his second class the unscientific virtue (ἀθεώρητος ἀρετή) of courage, together with health, strength and such-like "excellencies." Further, Panaetius had maintained that pleasure is not altogether a thing indifferent: there is a natural as well as an unnatural pleasure. But, if so, it would follow that, since pleasure is an emotion, apathy or eradication of all emotions cannot be unconditionally required. The gloss he put upon the definition of the end was "a life in accordance with the promptings given us by nature"; the terms are all used by older Stoics, but the individual nature (ἡμῖν) seems to be emphasized. From Posidonius, the last representative of a comprehensive study of nature and a subtle erudition, it is not surprising that we get the following definition: the end is to live in contemplation of the reality and order of the universe, promoting it to the best of our power, and never led astray by the irrational part of the soul. The heterodox phrase with which this definition ends points to innovations in psychology which were undoubtedly real and important, suggested by the difficulty of maintaining the essential unity of the soul. Panaetius had referred two faculties (those of speech and of reproduction) to animal impulse and to the vegetative "nature" (φύσις) respectively. Yet the older Stoics held that this φύσις was changed to a true soul (ψυχή) at birth. Posidonius, unable to explain the emotions as "judgments" or the effects of judgments, postulated, like Plato, an irrational principle (including a concupiscent and a spirited element) to account for them, although he subordinated all these as faculties to the one substance of the soul lodged in the heart. This was a serious departure from the principles of the system, facilitating a return of later Stoicism to the dualism of God and the world, reason and the irrational part in man, which Chrysippus had striven to surmount.[3]

Eclecticism.

Posidonius.

Yet in the general approximation and fusion of opposing views which had set in, the Stoics fared far better than rival schools. Their system became best known and most widely used by individual eclectics. All the assaults of the sceptical Academy had failed, and within fifty years of the death of Carneades his degenerate successors, unable to hold their ground on the question of the criterion, had capitulated to the enemy. Antiochus of Ascalon, the professed restorer of the Old Academy, taught a medley of Stoic and Peripatetic dogmas, which he boldly asserted Zeno had first borrowed from his school. The wide diffusion of Stoic phraseology and Stoic modes of thought may be seen on all hands—in the language of the New Testament writers, in the compendious "histories of philosophy" industriously circulated by a host of writers about this time (cf. H. Diels, *Doxographi graeci*).

The writings of the later Stoics have come down to us, if not entire, in great part, so that Seneca, Cornutus, Persius, Lucan, Epictetus, Marcus Aurelius are known at first hand. They do not profess to give a scientific exposition of doctrine, and may therefore be dismissed somewhat briefly (see EPICTETUS and MARCUS AURELIUS). We learn much more about the Stoic system from the scanty fragments of the first founders,[4] or even from the epitomes of Diogenes Laërtius and Stobaeus, than from these writers. They testify to the restriction of philosophy to the practical side, and to the increasing tendency, ever since Panaetius, towards a relaxation of the rigorous ethical doctrine and its approximation to the form of religious conviction. This finds most marked expression in the doctrines of submission to Providence and universal philanthropy. Only in this way could they hold their ground, however insecurely, in face of the religious reaction of the 1st century. In passing to Rome, Stoicism quitted the school for actual life. The fall of the republic was a gain, for it

The Later Stoics.

[3] Works of Posidonius and Hecato have served as the basis of extant Latin treatises. Cicero, *De divinatione*, perhaps *De natura deorum*, i. ii., comes in part from Posidonius; Cicero, *De finibus*, iii., and Seneca, *De beneficiis*, i.–iv., from Hecato, who is also the source of Stobaeus, *Ecl. eth.* ii. 110. Cf. H. H. Fowler, *Panaetii et Hecatonis fragmenta* (Bonn, 1885).

[4] Cf. C. Wachsmuth, *Commentationes II. de Zenone Citiensi et Cleanthe Assio* (Göttingen, 1874). Baguet's *Chrysippus* (Louvain, 1822) is unfortunately very incomplete.

released so much intellectual activity from civic duties. The life and death of Cato fired the imagination of a degenerate age in which he stood out both as a Roman and a Stoic To a long line of illustrious successors, men like Thrasea Paetus and Helvidius Priscus, Cato bequeathed his resolute opposition to the dominant power of the times; unsympathetic, impracticable, but fearless in demeanour, they were a standing reproach to the corruption and tyranny of their age. But when at first, under Augustus, the empire restored order, philosophy became bolder and addressed every class in society, public lectures and spiritual direction being the two forms in which it mainly showed activity. Books of direction were written by Sextius in Greek (as afterwards by Seneca in Latin), almost the only Roman who had the ambition to found a sect, though in ethics he mainly followed Stoicism. His contemporary Papirius Fabianus was the popular lecturer of that day, producing a powerful effect by his denunciations of the manners of the time. Under Tiberius, Sotion and Attalus were attended by crowds of hearers. In Seneca's time there was a professor, with few hearers it is true, even in a provincial town like Naples. At the same time the antiquarian study of Stoic writings went on apace, especially those of the earliest teachers—Zeno and Aristo and Cleanthes.

Seneca. Seneca is the most prominent leader in the direction which Roman Stoicism now took. His penetrating intellect had mastered the subtleties of the system of Chrysippus, but they seldom appear in his works, at least without apology. Incidentally we meet there with the doctrines of Pneuma and of tension, of the corporeal nature of the virtues and the affections, and much more to the same effect. But his attention is claimed for physics chiefly as a means of elevating the mind, and as making known the wisdom of Providence and the moral government of the world. To reconcile the ways of God to man had been the ambition of Chrysippus, as we know from Plutarch's criticisms. He argued plausibly that natural evil was a thing indifferent—that even moral evil was required in the divine economy as a foil to set off good. The really difficult problem why the prosperity of the wicked and the calamity of the just were permitted under the divine government he met in various ways: sometimes he alleged the forgetfulness of higher powers; sometimes he fell back upon the necessity of these contrasts and grotesque passages in the comedy of human life. Seneca gives the true Stoic answer in his treatise *On Providence*: the wise man cannot really meet with misfortune; all outward calamity is a divine instrument of training, designed to exercise his powers and teach the world the indifference of external conditions. In the soul Seneca recognizes an effluence of the divine spirit, a god in the human frame; in virtue of this he maintains the essential dignity and internal freedom of man in every human being. Yet, in striking contrast to this orthodox tenet is his vivid conception of the weakness and misery of men, the hopelessness of the struggle with evil, whether in society or in the individual. Thus he describes the body (which, after Epicurus, he calls the flesh) as a mere husk or fetter or prison of the soul; with its departure begins the soul's true life. Sometimes, too, he writes as if he accepted an irrational as well as a rational part of the soul. In ethics, if there is no novelty of doctrine, there is a surprising change in the mode of its application. The ideal sage has receded; philosophy comes as a physician, not to the whole but to the sick. We learn that there are various classes of patients in "progress" (προκοπή), *i.e.* on their way to virtue, making painful efforts towards it. The first stage is the eradication of vicious habits: evil tendencies are to be corrected, and a guard kept on the corrupt propensities of the reason. Suppose this achieved, we have yet to struggle with single attacks of the passions: irascibility may be cured, but we may succumb to a fit of rage. To achieve this second stage the impulses must be trained in such a way that the fitness of things indifferent may be the guide of conduct. Even then it remains to give the will that property of rigid infallibility without which we are always liable to err, and this must be effected by the training of the judgment. Other peculiarities of the later Stoic ethics are due to the condition of the times. In a time of moral corruption and oppressive rule, as the early empire repeatedly became to the privileged classes of Roman society, a general feeling of insecurity led the student of philosophy to seek in it a refuge against the vicissitudes of fortune which he daily beheld. The less any one man could do to interfere in the government, or even to safeguard his own life and property, the more heavily the common fate pressed upon all, levelling the ordinary distinctions of class and character. Driven inwards upon themselves, they employed their energy in severe self-examination, or they cultivated resignation to the will of the universe, and towards their fellow men forbearance and forgiveness and humility, the virtues of the philanthropic disposition. With Seneca this resignation took the form of a constant meditation upon death. Timid by nature, aware of his impending doom, and at times justly dissatisfied with himself, he tries all means of reconciling himself to the idea of suicide. The act had always been accounted allowable in the school, if circumstances should call for it: indeed, the first three teachers had found such circumstances in the infirmity of old age. But their attitude towards the "way out" (ἐξαγωγή) of incurable discomforts is quite unlike the anxious sentimentalism with which Seneca dwells upon death.

Musonius. From Seneca we turn, not without satisfaction, to men of sterner mould, such as Musonius Rufus, who certainly deserves a place beside his more illustrious disciple, Epictetus. As a teacher he commanded universal respect, and wherever we catch a glimpse of his activity he appears to advantage. His philosophy, however, is yet more concentrated upon practice than Seneca's, and in ethics he is almost at the position of Aristo. Epictetus testifies to the powerful hold he acquired upon his pupils, each of whom felt that Musonius spoke to his heart. The practical conclusion of his philosophy is that he must cheerfully accept the inevitable.

Epictetus. In the life and teaching of Epictetus this thought bore abundant fruit. The beautiful character which rose superior to weakness, poverty and slave's estate is also presented to us in the *Discourses* of his disciple Arrian as a model of religious resignation, of forbearance and love towards our brethren, that is, towards all men, since God is our common father. With him even the "physical basis" of ethics takes the form of a religious dogma—the providence of God and the perfection of the world. We learn that he regards the δαίμων or "guardian angel" as the divine part in each man; sometimes it is more nearly conscience, at other times reason. His ethics, too, have a religious character. He begins with human weakness and man's need of God: whoso would become good must first be convinced that he is evil. Submission is enforced by an argument which almost amounts to a retractation of the difference between things natural and things contrary to nature, as understood by Zeno. Would you be cut off from the universe? he asks. Go to, grow healthy and rich. But if not, if you are a part of it, then become resigned to your lot. Towards this goal of approximation to Cynicism the later Stoics had all along been tending. Withdrawal from the active duty of the world must lead to passive endurance, and, ere long, complete indifference. Musonius had recommended marriage and condemned unsparingly the exposure of infants. Epictetus, however, would have the sage hold aloof from domestic cares, another Cynic trait. So, too, in his great maxim "bear and *forbear*," the last is a command to refrain from the external advantages which nature offers.

Aurelius. Epictetus is marked out amongst Stoics by his renunciation of the world. He is followed by a Stoic emperor, M. Aurelius Antoninus, who, though in the world, was not of it. The *Meditations* give no systematic exposition of belief, but there are many indications of the religious spirit we have already observed, together with an almost Platonic psychology. Following Epictetus, he speaks of man as a corpse bearing about a soul; at another time he has a threefold division—(1) body, (2) soul, the seat of impulse (πνευμάτιον), and (3) νοῦς or intelligence, the proper *ego*. In all he writes there is a vein of sadness: the flux of all things, the vanity of life, are thoughts which perpetually recur, along with resignation to the will of God and forbearance towards others, and the religious longing to be rid of the burden and to depart to God. These peculiarities in M. Antoninus may perhaps be explained in harmony with the older Stoic teaching; but, when taken in connexion with the rise of Neoplatonism and the revival of superstition, they are certainly significant. None of the ancient systems fell so rapidly as the Stoa. It had just touched the highest point of practical morality, and in a generation after M. Antoninus there is hardly a professor to be named. Its most valuable lessons to the world were preserved in Christianity; but the grand simplicity of its monism slumbered for fifteen centuries before it was revived by Spinoza.

Literature.—The best modern authority is Zeller, *Phil. d. Griech.* iii. pt. i. (3rd ed., 1880)—Eng. trans. *Stoics*, by Reichel (1879), and *Eclectics*, by S. F. Alleyne (1883). STOKE NEWINGTON, a north-eastern metropolitan borough of London, England, bounded E. by Hackney and W. by Islington, and extending N. to the boundary of the county of London. Pop. (1901), 51,247. It is mainly occupied by small villas. On its western boundary, adjoining Green Lanes, lies Clissold Park (54 acres) and outside the north-western boundary is Finsbury Park (115 acres). In Church Street is the ancient parish church of St Mary, largely restored, but still bearing the stamp of antiquity; opposite to it stands a new church in Decorated style by Sir Gilbert Scott. In the north of the borough are the main waterworks and reservoirs of the New River Company, though the waterway continues to a head in Finsbury. Stoke Newington is partly in the north division of the parliamentary borough of Hackney, but the district of South Hornsey, included in the municipal borough, is in the Hornsey division of Middlesex. The borough council consists of a mayor, 5 aldermen and 30 councillors. Area, 863·5 acres.

STOKE-ON-TRENT, a market town and municipal and parliamentary borough of Staffordshire, England, on the upper Trent, in the heart of the Potteries district. Pop. (1901), 30,458. This was the population of the separate borough of Stoke-upon-Trent (area, 1882 acres) which existed until 1910. In 1908 arrangements were made whereby Stoke-upon-Trent, Burslem, Fenton, Hanley, Longton and Tunstall should be amalgamated as one borough, under the name of Stoke-on-Trent, from the 31st of March 1910. The new corporation consists of a mayor, 26 aldermen and 78 councillors. Stoke is on the North Staffordshire railway, 146 m. north-west from London by the London & North-Western railway; and on the Grand Trunk (Trent and Mersey) Canal. The principal public buildings in the old town of Stoke are the town hall, with assembly rooms, law library and art gallery, the market hall, the Minton memorial building, containing a school of art and science; the free library and museum, and the North Staffordshire infirmary, founded in 1815 at Etruria, and removed to its present site in 1868. The head offices of the North Staffordshire Railway Company are here. Four large firms manufacturing every variety of art china and earthenware alone employ over 5000 hands. Coal-mining and iron and machine manufactures are also carried on. A statue commemorates Josiah Wedgwood, born at Burslem in 1730; but other famous names in the pottery trade are more intimately connected with Stoke. Thus Josiah Spode the second was born here in 1754, and had a great house at Penkhull, on the western outskirts of Stoke. He entered into partnership with the Copelands, who continued his business. Herbert Minton (1793–1858) was the founder of another of the large works. The parliamentary borough returns one member.

In the Domesday Survey of 1086 half the church of Stoke and lands in Stoca are said to have belonged to Robert of Stafford. Part of Stoke (Stoche or Stoca) at this time belonged to the Crown, since the royal estate of Penculla (now Penkhull) was included within its bounds. Frequent references to the parish church of Stoke are found during the 14th and 15th centuries. Contemporary writers from 1787 onwards describe Stoke as a market town, but the official evidence states that the market rights were not acquired until 1845. Since then the market days have been Saturday and Monday. Stoke-upon-Trent became the railway centre and head of the parliamentary borough of Stoke-upon-Trent, comprising the whole of the Staffordshire Potteries, which was created by the Reform Bill of 1832. In 1874 it was incorporated as a municipality. From 1833 to 1885 Stoke returned two members to parliament. From the early 17th century, if not earlier, porcelain and earthenware manufactories existed at Stoke-upon-Trent, but they remained unnoticed until in 1686 Dr Plot wrote his survey of Staffordshire. In the middle of the 18th century there was a great industrial development in the Pottery district.

See John Ward, *The Borough of Stoke-upon-Trent* (London, 1843).

STOKE POGES, a village in the south of Buckinghamshire, England, 3 m. N. of Slough, famous for its connexion with the poet Thomas Gray. The church of St Giles has portions of Norman, Early English, and later dates, and contains a fine Decorated canopied tomb and brasses of members of the family of Moleyns. A passage or cloister leading towards the ancient manor-house contains some good original stained-glass windows. Gray is buried beside his mother in the churchyard, and there is a monument to his memory in the adjacent Stoke Park. The churchyard is generally considered to be the original of the poet's *Elegy in a Country Churchyard*; and the manor-house finds mention in his *Long Story*. West End Cottage, where he often stayed, remains in altered form as Stoke Court. Burnham Beeches (*q.v.*), now preserved to public use, and a favourite resort of the poet, are 3 m. distant to the north-west.

STOKES, SIR GEORGE GABRIEL, Bart. (1819–1903), British mathematician and physicist, was the youngest son of the Rev. Gabriel Stokes, rector of Skreen, Co. Sligo, where he was born on the 13th of August 1819. After attending schools in Dublin and Bristol, he matriculated in 1837 at Pembroke College, Cambridge, where, four years later, on graduating as senior wrangler and first Smith's prizeman, he was elected to a fellowship. This he had to vacate by the statutes of that society when he married in 1857, but twelve years later, under new statutes, he was re-elected, and retained his place on the foundation until 1902, when, on the day before he entered on his eighty-fourth year, he was elected to the mastership. But he did not long enjoy this position, for he died at Cambridge on the 1st of February in the following year. In 1849 he was appointed to the Lucasian professorship of mathematics in the university, and on the 1st of June 1899 the jubilee of his appointment was celebrated at Cambridge in a brilliant ceremonial, which was attended by numerous delegates from European and American universities. On that occasion a commemorative gold medal was presented to him by the chancellor of the university, and marble busts of him by Hamo Thornycroft were formally offered to Pembroke College and to the university by Lord Kelvin. Sir George Stokes, who was created a baronet in 1889, further served his university by representing it in parliament from 1887 to 1892. During a portion of this period (1885–1890) he was president of the Royal Society, of which he had been one of the secretaries since 1854, and thus, being at the same time Lucasian professor, he united in himself three offices which had only once before been held by one man, Sir Isaac Newton, who, however, did not hold all three simultaneously.

Stokes was the oldest of the trio of natural philosophers, Clerk Maxwell and Lord Kelvin being the other two, who especially contributed to the fame of the Cambridge school of mathematical physics in the middle of the 19th century. His original work began about 1840, and from that date onwards the great extent of his output was only less remarkable than the brilliance of its quality. The Royal Society's catalogue of scientific papers gives the titles of over a hundred memoirs by him published down to 1883. Some of these are only brief notes, others are short controversial or corrective statements, but many are really long and elaborate treatises. In matter his work is distinguished by a certain definiteness and finality, and even of problems, which when he attacked them were scarcely thought amenable to mathematical analysis, he has in many cases given solutions which once and for all settle the main principles. This result must be ascribed to his extraordinary combination of mathematical power with experimental skill, for with him, from the time when about 1840 he fitted up some simple physical apparatus in his rooms in Pembroke College, mathematics and experiment ever went hand in hand, aiding and checking each other. In scope his work covered a wide range of physical inquiry, but, as Alfred Cornu remarked in his Rede lecture of 1899, the greater part of it was concerned with waves and the transformations imposed on them during their passage through various media. His first published papers, which appeared in 1842 and 1843, were on the steady motion of incompressible fluids and some cases of fluid motion; these were followed in 1845 by one on the friction of fluids in motion and the equilibrium and motion of elastic solids, and in 1850 by another on the effects of the internal friction of fluids on the motion of pendulums. To the theory of sound he made several contributions, including a discussion of the effect of wind on the intensity of sound and an explanation of how the intensity is influenced by the nature of the gas in which the sound is produced. These inquiries together put the science of hydrodynamics on a new footing, and provided a key not only to the explanation of many natural phenomena, such as the suspension of clouds in air, and the subsidence of ripples and waves in water, but also to the solution of practical problems, such as the flow of water in rivers and channels, and the skin resistance of ships. But perhaps his best-known researches are those which deal with the undulatory theory of light. His optical work began at an early period in his scientific career. His first papers on the aberration of light appeared in 1845 and 1846, and were followed in 1848 by one on the theory of certain bands seen in the spectrum. In 1849 he published a long paper on the dynamical theory of diffraction, in which he showed that the plane of polarization must be perpendicular to the direction of vibration. Two years later he discussed the colours of thick plates; and in 1852, in his famous paper on the change of refrangibility of light, he described the phenomenon of fluorescence, as exhibited by fluorspar and uranium glass, materials which he viewed as having the power to convert invisible ultra-violet rays into rays of lower periods which are visible. A mechanical model, illustrating the dynamical principle of Stokes's explanation was shown in 1883, during a lecture at the Royal Institution, by Lord Kelvin, who said he had heard an account of it from Stokes many years before, and had repeatedly but vainly begged him to publish it. In the same year, 1852, there appeared the paper on the composition and resolution of streams of polarized light from different sources, and in 1853 an investigation of the metallic reflection exhibited by certain non-metallic substances. About 1860 he was engaged in an inquiry on the intensity of light reflected from, or transmitted through, a pile of plates; and in 1862 he prepared for the British Association a valuable report on double refraction, which marks a period in the history of the subject in England. A paper on the long spectrum of the electric light bears the same date, and was followed by an inquiry into the absorption spectrum of blood. The discrimination of organic bodies by their optical properties was treated in 1864; and later, in conjunction with the Rev. W. Vernon Harcourt, he investigated the relation between the chemical constitution and the optical properties of various glasses, with reference to the conditions of transparency and the improvement of achromatic telescopes. A still later paper connected with the construction of optical instruments discussed the theoretical limits to the aperture of microscopical objectives. In other departments of physics may be mentioned his paper on the conduction of heat in crystals (1851) and his inquiries in connexion with the radiometer; his explanation of the light border frequently noticed in photographs just outside the outline of a dark body seen against the sky (1883); and, still later, his theory of the Röntgen rays, which he suggested might be transverse waves travelling as innumerable solitary waves, not in regular trains. Two long papers published in 1849—one on attractions and Clairaut's theorem, and the other on the variation of gravity at the surface of the earth—also demand notice, as do his mathematical memoirs on the critical values of the sums of periodic series (1847) and on the numerical calculation of a class of definite integrals and infinite series (1850) and his discussion of a differential equation relating to the breaking of railway bridges (1849).

But large as is the tale of Stokes's published work, it by no means represents the whole of his services in the advancement of science. Many of his discoveries were not published, or at least were only touched upon in the course of his oral lectures. An excellent instance is afforded by his work in the theory of spectrum analysis. In his presidential address to the British Association in 1871, Lord Kelvin (Sir William Thomson, as he was then) stated his belief that the application of the prismatic analysis of light to solar and stellar chemistry had never been suggested directly or indirectly by any other savant when Stokes taught it to him in Cambridge some time prior to the summer of 1852, and he set forth the conclusions, theoretical and practical, which he learnt from Stokes at that time, and which he afterwards gave regularly in his public lectures at Glasgow. These statements, containing as they do the physical basis on which spectrum analysis rests, and the mode in which it is applicable to the identification of substances existing in the sun and stars, make it appear that Stokes anticipated Kirchhoff by at least seven or eight years. Stokes, however, in a letter published some years after the delivery of this address, stated that he had failed to take one essential step in the argument (not perceiving that emission of light of definite refrangibility not merely permitted, but necessitated, absorption of light of the same refrangibility), and modestly disclaimed "any part of Kirchhoff's admirable discovery," adding that he felt some of his friends had been over-zealous in his cause. It must be said, however, that English men of science have not accepted this disclaimer in all its fullness, and still attribute to Stokes the credit of having first enunciated the fundamental principles of spectrum analysis. In another way, too, Stokes did much for the progress of mathematical physics. Soon after he was elected to the Lucasian chair he announced that he regarded it as part of his professional duties to help any member of the university in difficulties he might encounter in his mathematical studies, and the assistance rendered was so real that pupils were glad to consult him, even after they had become colleagues, on mathematical and physical problems in which they found themselves at a loss. Then during the thirty years he acted as secretary of the Royal Society he exercised an enormous if inconspicuous influence on the advancement of mathematical and physical science, not only directly by his own investigations, but indirectly by suggesting problems for inquiry and inciting men to attack them, and by his readiness to give encouragement and help.

Several of the honours enjoyed by Sir George Stokes have already been enumerated. In addition, it may be mentioned that from the Royal Society, of which he became a fellow in 1851, he received the Rumford medal in 1852 in recognition of his inquiries into the refrangibility of light, and later, in 1893, the Copley medal. In 1869 he presided over the Exeter meeting of the British Association. From 1883 to 1885 he was Burnett lecturer at Aberdeen, his lectures on *Light*, which were published in 1884–1887, dealing with its nature, its use as a means of investigation, and its beneficial effects. In 1891, as Gifford lecturer, he published a volume on *Natural Theology*. His academical distinctions included honorary degrees from many universities, together with membership of the Prussian Order Pour le Mérite.

Sir George Stokes's mathematical and physical papers were published in a collected form in five volumes; the first three (Cambridge, 1880, 1883, and 1901) under his own editorship, and the two last (Cambridge, 1904 and 1905) under that of Sir Joseph Larmor, who also selected and arranged the *Memoir and Scientific Correspondence* of Stokes published at Cambridge in 1907.

STOKES, WHITLEY (1830–1909), British lawyer and Celtic scholar, was a son of William Stokes (1804–1878), and a grandson of Whitley Stokes (1763–1845), each of whom was regius professor of physic in the university of Dublin. In his day, William Stokes, who was the author of several books on medical subjects, was one of the foremost physicians in Europe. Educated at Trinity College, Dublin, young Stokes became an English barrister in 1855, and in 1862 he went to India, where he filled several official positions. In 1877 he was appointed legal member of the viceroy's council, and he drafted the codes of civil and criminal procedure and did much other valuable work of the same nature. In 1879 he was president of the commission on Indian law. He returned to England in 1882. In 1887 he was made a C.S.I., and two years later a C.I.E.; he obtained honorary degrees from many universities, and was a fellow of the British Academy. He died in London on the 13th of April 1909. Whitley Stokes is perhaps most famous as a Celtic scholar, and in this field he worked both in India and in England. He studied Irish, Breton and Cornish texts, and among his numerous works may be mentioned editions of *Three Irish Glossaries* (1862); *Three Middle-Irish Homilies* (1877); and *Old Irish Glosses at Würzburg and Carlsruhe* (1887). He was one of the editors of the *Irische Texte* published at Leipzig (1880–1900); and he edited and translated *Lives of Saints from the Book of Lismore* (1890). With Professor A. Bezzenberger he wrote *Urkeltischer Sprachschatz* (1894). His principal legal work was *The Anglo-Indian Codes* (1887).

STOKESLEY, JOHN (*c.* 1475–1539), English prelate, was born at Colly Weston in Northamptonshire, and became a fellow of Magdalen College, serving also as a lecturer. In 1498 he was made principal of Magdalen Hall, and in 1505 vice-president of Magdalen College. Soon after 1509 he was appointed a member of the royal council and chaplain to Henry VIII. In 1520 he was at the Field of the Cloth of Gold; in 1529 and 1530 he went to France and Italy as ambassador to Francis I. and to gain opinions from foreign universities in favour of the king's divorce from Catherine of Aragon. In 1530 he became bishop of London. In 1533 he christened the princess Elizabeth, and his later years were troubled by disputes with Archbishop Cranmer. Stokesley opposed all changes in the doctrines of the Church and was very active in persecuting heretics. He was a man of learning, writing in favour of Henry's divorce, and with Cuthbert Tunstall, bishop of Durham, a treatise against Cardinal Pole. He died on the 8th of September, 1539.

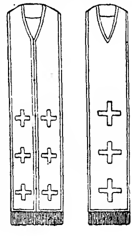
STOLBERG, FRIEDRICH LEOPOLD, Graf zu (1750–1819), German poet, the younger son of Count Christian Stolberg, was born at Bramstedt in Holstein on the 7th of November 1750. He studied in Göttingen and was a prominent member of the famous *Hain* or *Dichterbund*. After leaving the university he made a journey to Switzerland with his brother Christian, in company with Goethe. In 1777 he was appointed envoy of the prince bishop of Lübeck at the court of Copenhagen, but often stayed at Eutin, where he was the intimate associate of his college friend and member of the *Dichterbund*, Johann Heinrich Voss. In 1782 he married Agnes von Witzleben, whom he celebrated in his poems. After her early death in 1788, he became Danish envoy at the court of Berlin, and contracted a second marriage with the countess Sophie von Redern in 1789. In 1791 he was appointed president of the Lübeck episcopal court at Eutin; he resigned this office in 1800, and retiring to Münster in Westphalia, there joined, with his whole family, the eldest daughter only excepted, the Roman Catholic Church. For this step he was severely attacked by his former friend Voss (*Wie ward Fritz Stolberg ein Unfreier?* 1819). After living for a while (from 1812) in the neighbourhood of Bielefeld, he removed to his estate of Sondermühlen near Osnabrück, where he died on the 5th of December 1819. He wrote many odes, ballads, satires and dramas—among the last the tragedy *Timoleon* (1784), translations of the *Iliad* (1778), of Plato (1796–1797), Aeschylus (1802), and Ossian (1806); he published in 1815 a *Leben Alfreds des Grossen*, and a voluminous *Geschichte der Religion Jesu Christi* (17 vols., 1806–1818).

Stolberg's brother, Christian, Graf zu Stolberg (1748–1821), was also a poet. Born at Hamburg on the 15th of October 1748, he became a magistrate at Tremsbüttel in Holstein in 1777, and died on the 18th of January 1821. Of the two brothers Friedrich was undoubtedly the more talented, but Christian, though not a poet of high originality, excelled in the utterance of gentle sentiment. They published together a volume of poems, *Gedichte* (edited by H. C. Boie, 1779); *Schauspiele mit Chören* (1787), their object in the latter work being to revive a love for the Greek drama; and a collection of patriotic poems *Vaterländische Gedichte* (1815). Christian von Stolberg was the sole author of *Gedichte aus dem Griechischen* (1782), a translation of the works of Sophocles (1787), and of a poem in seven ballads, *Die weisse Frau* (1814), which last attained considerable popularity.

The Collected Works of Christian and Friedrich Leopold zu Stolberg were published in twenty volumes in 1820–1825; 2nd ed. 1827. Friedrich's correspondence with F. H. Jacobi will be found in Jacobi's *Briefwechsel* (1825–1827); that with Voss has been edited by O. Hellinghaus (1891). Selections from the poetry of the two brothers will be found in A. Sauer's *Der Göttinger Dichterbund*, iii. (Kürschner's *Deutsche Nationalliteratur*, vol. 50, 1896). See also T. Menge, *Der Graf F. L. Stolberg und seine Zeitgenossen* (2 vols., 1862); J. H. Hennes, *Aus F. L. von Stolbergs Jugendjahren* (1876); the same, *Stolberg in den zwei letzten Jahrzehnten seines Lebens* (1875); J. Janssen, *F. L. Graf zu Stolberg* (2 vols., 1877), 2nd ed. 1882; W. Keiper, *F. L. Stolbergs Jugendpoesie* (1893).

STOLBERG, a town of Germany, in the Prussian Rhine Province, situated on the Vichtbach, 7 m. E. of Aix-la-Chapelle, on the main line of railway to Cologne. Pop. (1905), 14,963. It contains two Protestant and two Roman Catholic churches, a castle occupying the site of one said to have been used by Charlemagne as a hunting seat. It is the centre of a very active and varied industry, exporting its produce to all parts of the world. The leading branch is metal-working, which is here carried on in important zinc, brass, and iron foundries, smelting-works of various kinds, puddling and rolling works, and manufactories of needles, pins and other metal goods. The ore is mostly found in the mines around the town, but some is imported from a considerable distance. In or near the town there are also large chemical works, glass-works, a mirror-factory and various minor establishments. Extensive coal-mines in the neighbourhood provide the enormous supply of fuel demanded by the various industries. The industrial prosperity of the town was founded in the middle of the 17th century by French religious refugees, who introduced the art of brass-founding.

STOLE (Lat. *stola* and *orarium*, Fr. *étole*, It. *stola*, Sp. *estola*, Ger. *Stola*), a liturgical vestment of the Catholic Church, peculiar to the higher orders, *i.e.* deacons, priests and bishops. It is a strip of stuff, usually silk, some 2½ yards long by 4 inches broad; in the middle and at the ends, which are commonly broadened out, it is ornamented with a cross. Its colour varies with the liturgical colour of the day, or of the function at which it is worn.



There is very little evidence as to the form and character of the stole before the Carolingian age; but from the 9th century onwards representations of the stole show that it varied in no essential particular from that of the present day. In the 11th, 12th and 13th centuries it was remarkably long and narrow. From the 9th to the 13th century it was mostly provided with a separate piece by way of finish to the ends, and this in the 12th and 13th centuries was as a rule trapeze-shaped. In the late middle ages the stole was usually of uniform breadth; but from the 16th century onwards the ends again began to be widened, until in the 18th century we have the hideous form with large shovel-shaped ends. Fringes, tassels, little bells and the like were used as decorations of the ends of stoles at least as early as the 9th century; but crosses in the middle and at the ends were rarely added during the middle ages. The usual material of medieval stoles was silk, and the better ones were embroidered with silk, gold thread, pearls, &c.

The stole is worn immediately over the alb; by deacons, scarf-wise over the left shoulder, across the breast and back to the right side; by priests and bishops, dependent from the neck, the two ends falling over the breast. In the case of bishops, however, the stole always hangs straight down; while priests wear it crossed over the breast when vested in the alb. Essentially, the actual method of wearing the stole conforms to the original practice. During the middle ages there were, however, deviations of custom: *e.g.* priests, even according to the Roman use, did not wear the stole crossed over the alb, though this had been prescribed for Spain so early as 675 by the 4th canon of the council of Braga. In southern Italy, probably under Greek influence, and in Milan (where the custom still survives) the diaconal stole was put on over the dalmatic. Similarly in Spain and Gaul, anterior to the Carolingian age, the stole was worn by deacons over the *alba* or outer tunic.

According to the Roman use the stole is now only worn at mass, in administering the sacraments and *sacramentalia*, when touching the Host, &c., but not *e.g.* at solemn offices or in processions. In the middle ages, however, it was the custom to wear it at nearly all liturgical functions. In the 9th and 10th century it was even made obligatory, by the decrees of the synods of Mainz (813) and Tribur (895), on priests throughout the Frank Empire to wear it at all times, especially when travelling. Elsewhere it was the custom to wear it always, at least for a year after ordination.

The custom of giving the stole to priests and deacons at their ordination is of great antiquity. So far as Spain is concerned there is evidence for it in the decrees of the 4th council of Toledo (633), and for Rome that of the 8th century *Ordo* of Mabillon. The present practice—according to which the bishop lays the stole over the left shoulder of the deacon, and crosses it over the breast of the priest—is already found in the pontificals of the 10th century.

There is no evidence to show when the stole was first used in the Western Church. In Gaul and Spain we already find it in the 6th century; our first evidence for its use in Rome is of the 8th century, which is however, of course, no proof that it was not in use earlier. The mosaic in the apse of S. Vitale at Ravenna, which has been taken to prove the existence of the stole in the first half of the 6th century, has no value as evidence, as the lower part of the figure of Bishop Ecclesius (see VESTMENTS, fig. 2) was renewed in the 12th century. It is noteworthy that at Rome, until the 10th century, the stole was worn by the lower orders of the clergy also.

In the Eastern Church the stole (Gr. ὠράριον, the diaconal stole, ἐπιτραχήλιον, the priestly stole; Slav. *orar* and *epitrachil*; Arm. *urar*; Syr. *uroro*; Nest. *urara*; Copt. *orarion* and *patrashil*) makes its appearance very early. The stole of the deacons is mentioned so early as the 4th and 5th centuries, the first instance being in the 22nd canon of the council of Laodicea, where it is mentioned specifically as the insignia of a deacon. Of a priestly stole we hear for the first time in the *Theoria mystica* (8th century). In the Maronite, Syrian, and Nestorian Churches subdeacons also wear the stole, and among the Maronites the lectors as well. There is very little evidence as to the character of the stole in the ancient Church of the East. The stole of priests and bishops, decorated with crosses, was worn originally in all rites as in the West, *i.e.* hanging in two loose bands over the breast; at the present day, according to the Greek rite, the two bands are firmly sewn together, while in the Armenian, Syrian and Coptic rites they have even been amalgamated into a single broad strip with an opening at the top for the head. Its ancient form has been retained only by the Nestorians, who wear it crossed over the breast. The diaconal stole was and continues to be worn usually hanging over the left shoulder, the ends falling straight down before and behind. Only the Copts and Armenians wear it scarf-wise. Originally the diaconal stole would seem to have been a narrow strip of folded linen, and it appears in the pictures of the 9th century as a narrow band ornamented with crosses. Later, it was often the habit to embroider on Greek diaconal stoles the words ΑΓΙΟΣ ΑΓΙΟΣ ΑΓΙΟΣ.

The question of the origin of the stole admits of no conclusive answer. It is certainly not derived from the antique *stola*, called *tunica*, as was formerly always held, nor yet from the prayer blanket (*tallith*) of the Jews. More careful investigation, moreover, throws very considerable doubt on the possibility of the derivation of the priest's stole from the ancient neck-cloth (*orarium*) and of the diaconal stole from a napkin used in the liturgy. A more reasonable theory seems to be that which suggests that, in the East, the stole was originally introduced as that which it was when it first appears in the 22nd canon of Laodicea, viz. a special liturgical mark of distinction for deacons, which in course of time was extended to all the higher orders. In all probability it was introduced straight from the East into Spain and Gaul. Rome also probably imported it from the same quarter, but weakened its significance by making it a cloth sanctified by being laid on the *Confessio* of St Peter, the bestowal of which at ordination was intended to express the fact that elevation to clerical office in the Roman Church was a grace bestowed *de benedictione S. Petri* and that the ordinands were undertaking with their consecration the duty of serving St Peter, *i.e.* the Roman Church.

Wherever the Reformation was introduced the stole was done away with, even when chasuble, alb and cope were retained; the reason being that it was the ensign of the major orders, which in the Catholic sense were rejected by the Reformers.[1] (J. BRA.)

STOLEN GOODS. In English law, various points of importance arise in connexion with chattels which have been the subject of larceny and have not been returned to the possession of their owner. The owner of the goods stolen has an action against the thief for the goods or their value. How far he is entitled to pursue his civil right to the exclusion of criminal prosecution does not seem very clear upon the authorities. In *Midland Insurance Co.* v. *Smith* (1881, L.R. 6 Q.B.D., 568), Mr Justice Watkin Williams said: "It has been said that the true principle of the common law is that there is neither a merger of the civil right, nor is it a strict condition precedent to such right that there shall have been a prosecution of the felon, but that there is a duty imposed upon the injured person not to resort to the prosecution of his private suit to the neglect and exclusion of the vindication of the public law; in my opinion this view is the correct one." Dealing with stolen goods by persons other than the thief may affect the rights of such persons either criminally or civilly. Two varieties of crime arise from such dealings. (1) Receiving stolen goods knowing them to have been stolen, a misdemeanour at common law, is by the Larceny Act a felony punishable by penal servitude for fourteen years where the theft amounts to felony, a misdemeanour punishable by penal servitude for seven years where the theft is a

[1] The stole was not one of the vestments prescribed by the rubrics of the first Prayer-book of Edward VI. (see VESTMENTS). It was replaced in the Church of England from the Reformation onwards by the scarf, a broad band of black silk, formerly part of the outdoor dress of the dignified clergy and without liturgical significance. This vestment has some resemblance to the stole, in that it is worn round the neck and hanging straight down in front over each shoulder. This resemblance led, during the 19th century, to a confusion of the two vestments. The scarf was narrowed into the black stole, sometimes ornamented with crosses embroidered in the centre behind and at the ends, and this was gradually replaced by coloured stoles, varying according to the church's seasons. The stole, either black or coloured, is now almost universally worn by the Anglican clergy, even where the other "eucharistic vestments" have not been adopted. It may be noted that, whatever may be the case with the other reformed churches, it is unsafe to argue from the disuse of the stole in the Church of England that this was intended to symbolize the rejection of the major orders "in the Catholic sense," unless this sense be taken to imply a necessary connexion with the doctrine of transubstantiation and the sacrifice of the mass. (W. A. P.)

misdemeanour, as in obtaining goods by false pretences. Recent possession of stolen property may, according to circumstances, support the presumption that the prisoner is a thief or that he is a receiver. The Prevention of Crime Act, 1871, made important changes in the law of evidence in charges of receiving. It allows, under proper safeguards, evidence to be given in the course of the trial of the finding of other stolen property in the possession of the accused, and of a previous conviction for any offence involving fraud and dishonesty. (2) Compounding theft, or *theftbote* (*redemptio furti*), that is, taking back stolen goods or receiving compensation on condition of not prosecuting, is a misdemeanour at common law. It need not necessarily be committed by the owner of the goods. Under the Larceny Act it is a felony punishable by seven years' penal servitude to take money or reward corruptly for helping to recover stolen goods without using all due diligence to bring the offender to trial. By the same act, to advertise or print or publish any advertisement offering a reward for the return of stolen goods, and using any words purporting that no questions will be asked, &c., renders the offender liable to a penalty of £50. This penalty must, by the Larceny (Advertisements) Act 1870, be sued for within six months, and the assent of the attorney-general is necessary. Various acts provide for the liabilities of pawnbrokers, publicans, marine-store dealers, and others into whose possession stolen goods come. Search for stolen goods can only be undertaken by a police officer under the protection of a search warrant. The law as to stolen goods, as far as it affects the civil rights and liabilities of the owner and third parties, is shortly as follows. As a general rule a purchaser takes goods subject to any infirmities of title. The property in money, bank-notes, and negotiable instruments passes by delivery, and a person taking any of these *bona fide* and for value is entitled to retain it as against a former owner from whom it may have been stolen. In the case of other goods, a *bona fide* purchaser of stolen goods in market overt (see SALE OF GOODS) obtains a good title (except as against the Crown), provided that the thief has not been convicted. After conviction of the thief the property revests in the owner, and the court before which the thief was convicted may order restitution, except in the cases specially mentioned in the Larceny Act, *i.e.* the *bona fide* discharge or transfer of a security for value without notice and the fraudulent dealing by a trustee, banker, &c., with goods and documents of title to goods entrusted to him. After conviction of the thief the goods must be recovered from the person in whose hands they are at the time of the conviction, for any sales and resales, if the first sale was in market overt, are good until conviction of the thief. The protection given by market overt is unknown in Scotland. If the goods were obtained by false pretences and not by larceny, the question then is whether the property in the goods has passed or not, and the answer to this question depends upon the nature of the false pretences employed. If the vendee obtains possession of goods with the intention by the vendor to transfer both the property and the possession, the property vests in the vendee until the vendor has done some act to disaffirm the transaction. But if there was never any such intention—if, for instance, the vendor delivers the goods to A.B. under the belief that he is C.D.—the property does not vest in the transferee, and the owner may recover the goods even from a *bona fide* purchaser.

In the United States the law as to stolen goods is regulated by statute in the various states, but the broad principles are practically in accordance with English law. The doctrine of market overt is not, however, acknowledged by any state. The purchaser from a thief gets no title as against the owner. One who buys goods from a factor who procured them by larceny is not protected by the Factors Act in New York (*Soltau* v. *Gerdau*, 119 N.Y. 380). To the same effect (*Gentry* v. *Singleton* (1904), 128 Fed. R. 679) is a purchase of cattle from a thief. The U.S. Supreme Court held, in an action of detinue to recover five negro slaves, that the English rule as to sale in market overt did not apply in the United States (*Ventress* v. *Smith*, 10 Peters 175). In Pennsylvania there is no market overt and a purchaser of personal property cannot get a good title from one without title by paying for it (1907, *Heisley* v. *Economy Tool Co.* 33, Pa. Super. Ct. 218). So in Maine (*Combs* v. *Gorden*, 59 Me. 111). In Massachusetts a sale of butter in the open market by one who had feloniously acquired possession of it did not transfer the property (*Dame* v. *Baldwin*, 8 Mass. 518). So held also in New York where horses stolen from there were sold in Canada, though a purchaser there is entitled to be reimbursed before delivering to the owner (*Edgerly* v. *Bush*, 81 N.Y. 199).

STOLICZKA, FERDINAND (1838–1874), Austrian palaeontologist, was born at Hochwald, in Moravia, in May 1838. He was educated at Prague and at the university of Vienna where he graduated Ph.D. He was encouraged to work at geology and palaeontology by Professor E. Suess and Dr M. Hoernes; and as early as 1859 he communicated to the Vienna Academy a description of some freshwater mollusca from the Cretaceous rocks of the north-eastern Alps. In 1861 he joined the Austrian Geological Survey, and in the following year he was appointed palaeontologist to the Geological Survey of India. In Calcutta the description of the Cretaceous fossils of Southern India was placed in his hands, and the publication of this great work which formed part of the *Palaeontologia indica*, was commenced with the assistance of H. F. Blanford in 1863 and completed in 1873. During the last ten years of his life he published geological memoirs on the western Himalayas and Tibet, and numerous papers on all branches of Indian zoology, from mammals to insects and corals. In 1873 he was selected as naturalist and geologist to accompany a mission despatched by the Indian government to Yarkund and Kashgar under Mr (afterwards Sir Douglas) Forsyth. His health, which had been severely affected by his previous field work in India, proved unequal to the strain, and he died on the 19th of June 1874, at Shayok, in Ladak, while "returning loaded with the spoils and notes of nearly a year's research in one of the least-known parts of Central Asia."

Memoir (with bibliography) by V. Ball, appended to *Scientific Results of the second Yarkand Mission*, 1886; Obituary by W. T. Blanford, *Nature*, July 9, 1874.

STOLP, or STOLPE, a town of Germany, in the Prussian province of Pomerania, on the Stolpe, 10 m. from the Baltic Sea and 64 m. W. of Danzig on the railway to Stargard, and with branches to Stolpmünde and Neustettin. Pop. (1905), 31,154. The large church of St Mary, with a lofty tower, dating from the 14th century, the Renaissance castle of the 16th century, now used as a prison, and one of the ancient town-gates restored in 1872 are memorials of the time when Stolp was a prosperous member of the Hanseatic League. It has also the church of St John, built in the 13th century, a new town hall, and a statue of Bismarck. The manufacture of machinery, amber articles, tobacco and cigars, and bricks, with some iron-founding, linen-weaving, and salmon-fishing in the Stolpe, are the chief industrial occupations of the inhabitants, who also carry on trade in grain, cattle, spirits, timber, fish and geese. Stolpmünde, a fishing-village and summer resort, at the mouth of the river, is the port of Stolp.

Stolp, mentioned in the 11th century, received town rights in 1273. From the 14th to the 16th century it was a member of the Hanseatic League. Until 1637, when it passed to Brandenburg, the town was generally in the possession of the dukes of Pomerania.

STOMACH (Gr. στόμαχος from στόμα, a mouth), the bag-like digestive organ which in man is situated in the upper left part of the abdomen. See, for anatomical details, ALIMENTARY CANAL. For the diseases of the stomach in general see DIGESTIVE ORGANS; and for special forms GASTRITIS, GASTRIC ULCER, DYSPEPSIA, &c.; also ABDOMEN (*Abdominal Surgery*).

Cancer of the Stomach is a common disease. It occurs for the most part in persons at or after middle life, and in both sexes equally. Its favourite situation is the outlet (pyloric cancer), where a hard, fibrous growth forms a contracting ring of the scirrhous variety. But when cancer attacks the inlet of the stomach, the tumour is of the scaly epitheliomatous variety. It often begins in the tissues of the end of the gullet, spreading downwards to the stomach. Chronic gastric ulcer is not unfrequently the starting point of cancer.

The symptoms of cancer of the stomach are apt to be indefinite (for many weeks or months). There may be long-standing complaints of "indigestion," which is sometimes made better, sometimes worse, by taking food. Then comes a feeling of discomfort which can be often localized, the individual pointing with his finger to a spot somewhere behind the end of the breastbone. Difficulty and pain in swallowing may be complained of when the cancer is beginning to block the inlet, but if it is situated at the pylorus the discomfort comes on an hour or two after a meal—at the time that the partially digested food is trying to make its way into the small intestine. Much of the food remains in the stomach and, undergoing fermentation, causes the evolution of gas which distends the stomach and gives rise to unavoidable belching. Later on vomiting occurs. The vomiting may take place every two or three days, enormous quantities of undigested food mixed with frothy, yeast-like mucous being thrown up. And whilst the stomach is slowly filling up again after one of these uncontrollable emptyings, sudden and violent movements of the individual may cause the fluid to give rise to audible "splashings." But even at this stage the disease may be unrecognizable, though the symptoms are extremely suggestive. But later the vomited matter is blackened by blood which has escaped into the stomach from the ulcerated growth. The patient then rapidly loses flesh and strength, and a hard lump may be felt in the upper part of the abdomen.

A characteristic feature of cancer is the carrying of the epithelial cells (which are the essential element of the growth) to the nearest lymphatic glands, and in cancer of the stomach the secondary implication of the glands may cause the formation of large masses between the stomach and the liver, which may press upon the large veins and give rise to dropsy. Secondary deposits are apt to form also in the liver and they may cause the appearance of a bulging below the ribs on the right side.

Another characteristic of cancer is that it spreads far and wide, drawing other tissues to itself by contracting fibrous bands. These are sometimes erroneously spoken of as the "roots" of cancer, and in the case of cancer of the stomach they may fix it to the pancreas, the liver, the bowels or the spine. The invasion of the lymphatic glands and the spreading of the growth into neighbouring organs, render the successful operative treatment of gastric cancer hazardous and disappointing. By the time that a tumour has made itself recognisable the probability is that it is too late for the attempt to be made for its removal. But in many cases the patient prefers that the abdomen should be opened for exploration for a possible operation than that he should hopelessly give himself over to the disease. And sometimes the surgeon is enabled by operation to give great relief, though the removal of the growth itself is impracticable.

When the growth is at the cardiac end of the stomach, blocking the gullet and causing slow starvation, the abdomen may advisedly be opened, and, the stomach having been fixed to the surface-wound, a permanent opening may be arranged for the introduction of an adequate amount of food. This operation is called *gastrostomy* and may be the means of giving many weeks of comfort to the unhappy patient—provided that its performance is not too long postponed. In the case of pyloric obstruction a permanent opening may be established between the stomach and a neighbouring piece of intestine, so that the food may find its way along the alimentary canal greatly to the relief of the symptoms of gastric dilatation. This is called "short-circuiting."

In some early cases of pyloric cancer resection of the disease may be performed, the upper end of the intestine being afterwards joined to the middle of the stomach by a kind of short-circuiting operation. In certain rare cases the whole of the stomach has been removed, the bowel being brought up and spliced to the end of the gullet.

In the case of gastric dilatation from pyloric obstruction great relief may be afforded by washing out the viscus by means of a long rubber tube, a funnel, and a jug of hot water, as originally suggested by Adolf Küssmaul.

Pyloroplasty.—Simple fibrous narrowing of the gateway of the stomach or of the intestine is dealt with by dividing it longitudinally and then suturing the edges of the wound transversely. This ingenious operation widens the track at the expense of an unimportant fraction of its length. In cases of great dilatation of the stomach with no obstruction to the outlet the slack of the walls may be gathered up by pleating and so permanently secured by suturing. Loreta's operation for dilatation of the outlet of the stomach is now rarely performed. (E. O.*)

STONE, CHARLES POMEROY (1824–1887), American soldier, was born in Greenfield, Massachusetts, on the 30th of September 1824. He graduated at West Point in 1845, and in the Mexican War earned two brevets for distinguished conduct. In 1856 he resigned from the army; and in 1857–1861 he led a scientific expedition in the state of Sonora, Mexico. He re-entered the service in 1861, and became a brigadier-general, United States Volunteers, but the defeat of a detachment at Ball's Bluff (Oct. 21, 1861) was attributed to him, and he was imprisoned for six months, being then released without any charge being brought against him. After serving for short periods in the latter stages of the war, he resigned his commission (Sept. 1864). He was engineer and superintendent of a mining company in Virginia from 1865 to 1870, when he entered the military service of the khedive of Egypt, whose chief of staff and general aide-de-camp he became, with the rank of lieutenant-general and the title of "Ferik Pasha." He returned to the United States in 1883, and resumed his engineering work. He died in New York City on the 24th of January 1887.

STONE, EDWARD JAMES (1831–1897), British astronomer, was born in London on the 28th of February 1831. Educated at the City of London School, he obtained a studentship at King's College, London, and in 1856 a scholarship at Queen's College, Cambridge, graduated as fifth wrangler in 1859, and was immediately elected fellow of his college. The following year he succeeded the Rev. R. Main as chief assistant at the Royal Observatory, Greenwich, and at once undertook the fundamental task of improving astronomical constants. The most important of these, the sun's mean parallax, was at that time subject to considerable uncertainty. From a discussion of the observations of Mars made in 1860 and 1862 at Greenwich and Williamstown (near Melbourne), Stone deduced for it a value of 8·932″ (*Mon. Not. R.A.S.* xxiii. 183), and in a further investigation in which he included the observations made in 1862, at the Cape of Good Hope, he obtained 8·945″ (*Mem. of R.A.S.*, vol. xxxiii.). Confirmatory results were afforded by his discussion of the observations of the transit of Venus in 1769 which yielded the figure 8·91″ (*Mon. Not. R.A.S.* xxviii. 255). In 1865 he contributed a memoir to the Royal Astronomical Society on the constant of lunar parallax. He also determined the mass of the moon, and from a discussion of the Greenwich transit circle observations between 1851 and 1865 he found for the constant of nutation the value 9·134″. These services were recognized by the award of the Royal Astronomical Society's gold medal in 1869, and on the resignation of Sir Thomas Maclear in 1870 he was appointed Her Majesty's astronomer at the Cape. His first task on taking up this post was the reduction and publication of a large mass of observations left by his predecessor, from a selected portion of which (those made 1856–1860) he compiled a catalogue of 1159 stars. His principal work was, however, a catalogue of 12,441 stars to the 7th magnitude between the South Pole and 25° S. declination, which was practically finished by the end of 1878 and published in 1881. Shortly after the death of Main on the 9th of May 1878, Stone was appointed to succeed him as Radcliffe Observer at Oxford, and he left the Cape on the 27th of May 1879. At Oxford he extended the Cape observations of stars to the 7th magnitude from 25° S. declination to the equator, and collected the results in the *Radcliffe Catalogue* for 1890, which contains the places of 6424 stars. Stone observed the transit of Venus of 1874 at the Cape, and organized the government expeditions for the corresponding event in 1882. He was elected president of the Royal Astronomical Society (1882–1884), and he was the first to recognize the importance of the old observations accumulated at the Radcliffe Observatory by Hornsby, Robertson and Rigaud (*Mon. Not. R.A.S.*, vol. lv.). He successfully observed the total solar eclipse of the 8th of August 1896 at Novaya Zemlya, and purposed a voyage to India for the eclipse of 1898, but died suddenly at the Radcliffe Observatory on the 9th of May 1897. The number of his astronomical publications exceeds 150, but his reputation depends mainly on his earlier work at Greenwich and his two great star catalogues—the *Cape Catalogue* for 1880 and the *Radcliffe Catalogue* for 1890.

STONE, FRANK (1800–1859), British painter, was born in Manchester, and was entirely self-taught. He was elected an associate of the Society of Painters in Water Colours in 1833 and member in 1843; and an associate of the Royal Academy in 1851. The works he first exhibited at the Academy were portraits, but from 1840 onwards he contributed figure pictures, scenes from Shakespeare, scripture and sentimental subjects, many of which were engraved.

STONE, GEORGE (1708–1764), archbishop of Armagh, was the son of Andrew Stone, a London banker, and was educated at Westminster School and Christ Church, Oxford. Having taken holy orders his advancement in the Church was very rapid, mainly through the influence of his brother Andrew. Andrew Stone (1703–1773), who was five years older than George, became private secretary to the duke of Newcastle about 1729, and was for many years on the most intimate and confidential terms both with the duke and with his brother Henry Pelham. In 1734 he was appointed under-secretary of state, and he soon gained a position of great personal influence with George II. by whom he was made tutor to Prince George, afterwards George III. On the accession of the latter to the throne, Andrew Stone was appointed treasurer to Queen Charlotte, and attaching himself to Lord Bute he became an influential member of the party known as "the king's friends," whose meetings were frequently held at his house. He was, therefore, well able to promote the preferment of his brother George, who went to Ireland as chaplain to the duke of Dorset when that nobleman became lord-lieutenant in 1731. In 1733 George Stone was made dean of Ferns, and in the following year he exchanged this deanery for that of Derry; in 1740 he became bishop of Ferns, in 1743 bishop of Kildare, in 1745 bishop of Derry, and in 1747 archbishop of Armagh. During the two years that he occupied the see of Kildare he was also dean of Christchurch, Dublin.

From the moment that he became primate of Ireland, Stone proved himself more a politician than an ecclesiastic. "He was said to have been selfish, worldly-minded, ambitious and ostentatious; and he was accused, though very probably falsely, of gross private vice."[1] His aim was to secure political power, a desire which brought him into conflict with Boyle, the Speaker of the Irish House of Commons, who had organized a formidable opposition to the government. The duke of Dorset's reappointment to the lord-lieutenancy in 1751, with his son Lord George Sackville as secretary of state for Ireland, strengthened the primate's position and enabled him to triumph over the popular party on the constitutional question as to the right of the Irish House of Commons to dispose of surplus Irish revenue, which the government maintained was the property of the Crown. But when Dorset was replaced by the duke of Devonshire in 1755, Boyle was raised to the peerage as earl of Shannon and received a pension, and other members of the opposition also obtained pensions or places: and the archbishop, finding himself excluded from power, went into opposition to the government in alliance with John Ponsonby. These two, afterwards joined by the primate's old rival Lord Shannon, and usually supported by the earl of Kildare, regained control of affairs in 1758, during the viceroyalty of the duke of Bedford. In the same year Stone wrote a remarkable letter, preserved in the *Bedford Correspondence* (ii. 357), in which he speaks very despondingly of the material condition of Ireland and the distress of the people. The archbishop was one of the "undertakers" who controlled the Irish House of Commons, and although he did not regain the almost dictatorial power he had exercised at an earlier period, which had suggested a comparison between him and Cardinal Wolsey, he continued to enjoy a prominent share in the administration of Ireland until his death, which occurred in London on the 19th of December 1764.

Although this "much-abused prelate," as Lecky calls him, was a firm supporter of the English government in Ireland, he was far from being a man of tyrannical or intolerant disposition. It was due to his influence that in the anti-tithe disturbances in Ulster in 1763 the government acted with conspicuous moderation, and that the movement was suppressed with very little bloodshed; he constantly favoured a policy of conciliation towards the Roman Catholics, whose loyalty he defended at different periods of his career both in his speeches in the Irish House of Lords and in his correspondence with ministers in London. Archbishop Stone, who never married, was a man of remarkably handsome appearance; and his manners were "eminently seductive and insinuating." Richard Cumberland, who was struck by the "Polish magnificence" of the primate, speaks in the highest terms of his courage, tact, and qualities as a popular leader. Horace Walpole, who gives an unfavourable picture of his private character, acknowledges that Stone possessed "abilities seldom to be matched"; and he had the distinction of being mentioned by David Hume as one of the only two men of mark who had perceived merit in that author's *History of England* on its first appearance. He was himself the author of several volumes of sermons which were published during his lifetime.

STONE, LUCY [Blackwell] (1818–1893), American reformer, anti-slavery and woman's-rights leader, was born in West Brookfield, Massachusetts, on the 13th of August 1818. Her father refused her the college education that she so eagerly desired, but she earned enough to carry her through Oberlin College, where she graduated in 1847. She immediately went on the lecture platform as an advocate of abolition and of woman's rights, and her remarkable voice and commanding eloquence often held in check the most disorderly audiences. In 1855 she married Dr Henry B. Blackwell (1824–1909), a prominent abolitionist and advocate of woman's rights, who agreed that she should keep her maiden name; after 1870 he assisted his wife in the management of the *Woman's Journal* of Boston, of which she became editor in 1872. She allowed her New Jersey property to be sold for taxes, and then published a pamphlet on "taxation without representation." She campaigned for woman's suffrage amendments in Kansas (1867), Vermont (1870), Michigan (1874), Colorado (1877) and Nebraska (1892). She died in Dorchester, Mass., on the 18th of October 1893. Her daughter, Alice Stone Blackwell (b. 1857), carried on, with her father, the *Woman's Journal* after 1893, and in 1885–1905 edited the *Woman's Column*.

Her husband's sisters, Elizabeth Blackwell (1821–1910) and Emily Blackwell (1826–1910), were prominent physicians. The former graduated at the Geneva Medical College, Geneva, New York, in 1849, receiving the first physician's degree granted to a woman in the United States, and studied in Philadelphia, in Paris and in London, where she began to practise in 1869. She died at Hastings on the 1st of June 1910. Emily Blackwell graduated at the Medical Department of Western Reserve University in 1854; in 1853, with her sister, she founded the New York Infirmary for Women and Children; and she was for many years dean of the Woman's Medical College of the New York Infirmary which she and her sister established in 1865.

STONE, MARCUS (1840–), English painter, son of Frank Stone, A.R.A., was trained by his father and began to exhibit at the Academy before he was eighteen; and a few years later he illustrated with much success books by Charles Dickens, Anthony Trollope, and other writers, friends of his family. He was elected an associate of the Royal Academy in 1877, and academician in 1887. In his earlier pictures he dealt much with historical incidents, but in his later work he occupied himself chiefly with a particular type of dainty sentiment, treated with much charm, refinement and executive skill. One of his canvases is in the National Gallery of British Art. Most of his works have been engraved, and medals have been awarded to him at exhibitions in all parts of the world.

See the *Life and Work of Marcus Stone, R.A.*, by A. L. Baldry (*Art Journal* office, 1896).

STONE, NICHOLAS (1586–1647), English sculptor and architect, was the son of a quarryman of Woodbury, near Exeter, and as a boy was apprenticed to Isaac James, a London mason. About 1603 he went to Holland and worked under the sculptor Hendrik de Keyser (1567–1621) and his son Pieter, and married his master's daughter. Stone is said to have made the portico to the Westerkerk at Amsterdam. Returning to London about 1613 with Bernard Janssens (*fl.* 1610–1630), a fellow pupil,[1] he settled in Southwark and obtained a large practice; in 1619 he was appointed master-mason to James I., and in 1626 to Charles I.; and he died in London on the 24th of August 1647. Stone, whose work is associated with Inigo Jones's introduction of Renaissance architecture into England, ranks as the great sculptor of his time and the rejuvenator of the art in England. He is best known by his monuments, notably those to Sir Francis Vere, the earl of Middlesex, and Francis Holles in Westminster Abbey; Sir Dudley Digges at Chilham church, Kent; Henry Howard, earl of Northampton, in Dover Castle (removed to Greenwich); Sir Thomas Sutton, at the Charterhouse (with Janssens); Sir Robert Drury at Hawstead church, Suffolk; Sir William Stonhouse at Radley church, Berkshire; Sir Thomas Bodley at Merton College, Oxford; Sir William Pope, in Wroxton church, near Banbury; Sir Nicholas Bacon, in Redgrave church, Suffolk (with Janssens); Dr John Donne (winding-sheet), at St Paul's Cathedral; and Sir Julius Caesar, in St Helen's, Bishopsgate.

He had three sons: John (d. 1667), a sculptor; Henry (d. 1653)—commonly known as "Old Stone"—a painter, whose copies of Van Dyck were famous, and whose portraits of Charles I. and others are in the National Portrait Gallery; and Nicholas (d. 1647), a sculptor, who worked under Bernini at Rome and left a sketch-book, which, with a note-book of his father's (giving a list of his works between 1614 and 1641), is in the Soane Museum.

See an article by A. E. Bullock in the *Architectural Review*, 1907, and the same author's illustrated monograph *Some Sculptural Works of Nicholas Stone* (Batsford, London, 1908).

STONE, a market town in the western parliamentary division of Staffordshire, England, on the river Trent, 7 m. N. of Stafford by the North Staffordshire railway. Pop. of urban district (1901), 5680. Part of the walls and crypt remain of an abbey which dates from the foundation of a college of canons in 670. The church of St Michael dates from 1750, the abbey church having collapsed in the previous year. Alleyne's grammar school is a foundation of 1558. The chief industry is shoemaking, but malting, brewing and tanning are also carried on. At Bury Bank, on the hills to the north, an earthwork is traditionally considered to be the site of the capital of the Kingdom of Mercia; there are other works in the neighbourhood at Saxon Low.

STONE (O. Eng. *stân*; the word is common to Teutonic languages, cf. Ger. *Stein*, Du. *steen*, Dan. and Swed. *sten*; the root is also seen in Gr. στία, pebble), a detached piece or fragment of rock. The word is thus applied to the small fragments scattered in the ground or on roads, to the water-worn pebbles of the sea shore or river beds, and to the hewn, dressed or shaped rock used as a building material, with which this article deals. A qualifying word generally accompanies "stone" when the term is applied to pieces of rock cut to a particular size and shape and used for a specific purpose, *e.g.* "mill-stone," "hearth-stone," "gravestone," &c. The term "precious stone" is used of those minerals which, from their beauty of colour, &c., their rarity, and sometimes their hardness, are valued for their suitability for ornaments (see GEMS). The word is also often applied to many objects resembling a stone or pebble, such as the hard kernel of certain fruits, as of the cherry, plum, peach, &c., or the *calculi* or concretions sometimes formed in the gall or urinary bladder or the kidneys (see BLADDER DISEASES and KIDNEY DISEASES). The "stone" has been a common measure of weight in north-western Europe. In Germany the "Stein" was of 20 to 22 ℔. In the British system of weights the "legal" stone, or "horseman's" weight is of 14 ℔ avoirdupois; in weighing wool it was also of 14 ℔, but is now usually 16 ℔. The "customary" stone for fish or butcher's meat is of 8 ℔.

Building-stone.—In selecting a stone for building purposes many important points have to be considered. The stone must be strong enough to bear the load placed upon it, it must be durable and weather well in the atmosphere of the district, and its colour and appearance need to be studied. It must further be ascertained whether a sufficient supply is available, and the price also must be taken into account; some difficulty is often experienced in obtaining a suitable stone at a moderate cost, and considerations of expense frequently have more to do with the choice of a stone than the architect would wish. Where there is risk of fire, as is often the case in business and factory premises, it is necessary to select a stone able to stand the effect of a great heat without damage. Great experience of the strength of stones and of their behaviour in different situations is desirable; but even when this knowledge is given and the greatest care is combined with it, some point may be overlooked. For example, the stone facing of the Houses of Parliament at Westminster was chosen on the recommendation of a committee composed of men of eminent scientific and technical skill; yet it has not weathered well because it is not constituted to resist the destroying effects of the London atmosphere.

Constitution.

The prime factor in the choice of a building stone should be the climate to which the material has to be exposed. Stone that in the pure country air has proved extremely durable may quickly decay in an impure city atmosphere, or when subjected to the strong salt winds from the sea. Extremes of temperature, too, are, generally speaking, prejudicial to the life of stone, the alternations of heat and cold setting up movements in the substances of the stone, which, though slight, will in many cases hasten its disintegration. There are few materials which more quickly decay and fail than stone placed under unsuitable conditions. An analysis, made by E. G. Clayton, of a sample of incrustation found on the Portland stone masonry of St Paul's Cathedral, London, gave the following result:—

	Weight per cent.
Water (lost at 100°)	2·06
Water (lost at 150°)	22·48
Carbon (soot)	1·10
Calcium sulphate	59·38
Calcium phosphate	2·22
Calcium silicate	1·63
Magnesium silicate	0·67
Iron silicate	2·40
Sand and uncombined silica	8·06
	100·00

The deposit when reduced to a fine grey powder and placed under the microscope did not appear to contain any organic matter. Mr Clayton says that this test points to the fact that the principal constituent of limestones, namely calcium carbonate, has been changed into calcium sulphate by the action of sulphurous and sulphuric acids ever present in the smoky London air. Impurities of this nature lodge on the face of the stone and are diluted and driven into the pores by subsequent rain. Having by their chemical action destroyed a portion of the substance of the material, they cause a slight crust to form on the surface which is in turn washed off. Carbonates of lime and magnesia, the chief constituents of ordinary marbles and limestones, are very susceptible to the solvent action of these acids. Pure water has little or no chemical action upon most building stones, but a danger arises to a porous stone even when situated in pure air. Water will soak into some stones in considerable quantities, and in frosty weather this fact constitutes a serious menace to the rock; for water when passing from the liquid to the solid state exerts if checked an enormous pressure, and the face, and sometimes the bulk, of the stone is frequently damaged in this way. One of the best precautions that can be taken by an architect is a personal visit to the quarry, to examine the stone in its natural situation. This, of course, will give little clue to its behaviour in an impure atmosphere, and therefore, if the particular stone has been previously used in the same district, the buildings in which it has been employed should also be inspected. A hard and lasting stone will show the marks of the tooling, and the arrises of the blocks will be sharp and good, even after many years' exposure.

[1] Also called Janssen (*Dict. Nat. Biog.*), Jansen and Janson. Possibly he was the brother of the Gerard (Geraert) Jansen or Johnson, of Southwark, who in 1616 executed the bust of Shakespeare in Stratford church; but it is uncertain whether the latter was identical with, or the son of, the Dutch tomb-maker Gerard Jansen described in Sir W. Dugdale's *Diary* as having, in 1593, lived for twenty-six years in England and as the father of five sons.

Colour. The colour has a considerable bearing upon the selection of a stone, but this, although a very important matter, must give way before the question of durability. In large towns and manufacturing districts this is most emphatically the case, for within a few years of erection the exterior of a building in such districts is disguised under a coating of soot and grime.

Should the stone contain iron, especially in the form of "pyrites," there is a great likelihood of its being stained more or less badly by iron "rust." If the metal is distributed evenly in small particles throughout the mass the rusting may do no more harm than merely deepen the tone of the stone, but if present in large pieces the stain may be so serious as to spoil the appearance entirely.

Testing. When the durability of stone has not been tried over some considerable period in a building actually erected, the most careful physical and chemical tests should be made. If the stone passes the following tests satisfactorily it may safely be assumed to be of good quality and likely to prove durable: (1) Resistance to crushing; (2) acid test; (3) absorption test; (4) microscopical examination.

The resistance to crushing varies to an enormous extent with the different kinds of stone, from a little over 60 tons per square foot, which is the limit for a weak limestone, up to a load of over 1300 tons necessary to crush the hardest granites. In general practice the load placed upon stone should not exceed one-tenth of the crushing weight as found by testing typical specimens. A six-inch cube is a convenient size often adopted for the blocks to which the crushing test is to be applied.

The effect produced by soaking pieces of stone for some days in a 1% solution of sulphuric and hydrochloric acids will decide roughly whether it will be durable in a city atmosphere. The vessel containing the test should be agitated twice a day; the action of the acid is to dissolve any portions of the stone that would be decomposed by the action of smoke and acid fumes.

A block of the stone under consideration should be dried thoroughly in a warm kiln or oven and carefully weighed before it has time to absorb moisture from the air. It must then be placed to soak in clean water for twenty-four hours and after removal again weighed. The difference between the weights registered will give the weight of water absorbed, and this should not be more than 10% of the weight of the dry block. There are, however, exceptions to this test, some very porous stones being capable of taking up a large quantity of water and at the same time proving durable in use. But such material is liable to allow damp to penetrate through it to the interior of the building in which it is employed.

The microscope is the best means of determining the structure of a stone, and of recognizing the presence of matter likely to affect its usefulness adversely. Should iron pyrites be discovered in any quantity the stone should be rejected, as this impurity easily decomposes on exposure, and badly stains and sometimes splits the stone.

The hardest, least absorbent, and most compact and uniform stones are of ancient geological formation, and with time and increase of superimposed pressure have become dense and very hard. The softer stones are of later formation, and are usually lighter in weight and more porous. A good stone should ring clearly when struck with steel, and a fresh fracture should on examination be bright, clean and sharp in texture and free from loose grains. A dull earthy appearance indicates an inferior stone.

A simple test for determining whether a stone contains much earthy matter is this: Some small chippings from the stone are placed in a vessel with sufficient water to cover the pieces, and are left undisturbed for about three-quarters of an hour. The water is then gently agitated. With stone of a highly crystalline nature, having its particles well cemented together, the water will remain clear, but stone containing earth and clay will cause the water to become thick and cloudy in appearance.

Preservatives. The action of the air of certain districts has been shown to be prejudicial to the durability of many stones. A striking instance of this peculiarity is afforded by Cleopatra's Needle on the Thames Embankment. This is an Egyptian monument of carved granite which undoubtedly stood for some thousands of years with little deterioration on the spot from which it was removed. But since its erection in London it has been found necessary to coat it periodically with a preservative solution in order to check the rapid decay set up by the impurities of the London atmosphere. Similarly the Egyptian obelisk in Central Park, New York, U.S.A., has for the same reason been coated with a preparation of paraffin containing creosote dissolved in turpentine. The surface of the stone was heated by means of lamps and charcoal stoves, and the compound applied hot.

The most usual method adopted for preserving stonework is to paint the exposed surfaces with ordinary oil colour. This fills the pores of the stone and forms a coat which, though weatherproof, completely hides the natural beauty of the stone. The painting must be redone every four or five years. *Boiled linseed oil* is sometimes used on stonework, one or more coats being well brushed in after cleaning it. Its use deepens the colour of the stone, and unless very carefully done the work is apt to appear patchy. A large number of processes consist of coating the stonework with a solution of soluble silica. In *Kuhlmann's process* a solution of silicate of potash or soda is brushed into the stone and, aided by the carbonic acid in the air, acts upon some of the constituents of the stone and forms a hard surface which is not liable to decay. In *Ransome's process*, a solution of silicate of soda is applied until the surface of the stone has become saturated. This is allowed to dry and a solution of chloride of calcium is then applied in a similar manner. The two solutions act together and by decomposition produce an insoluble silicate of lime which fills the pores of the stone and binds its particles together, thereby checking decay. *Baryta water* will, when applied to limestone that has decayed owing to the action of sulphurous fumes, penetrate into and solidify the crumbling portions, with the result that the stone is reconstituted and becomes hard and quite solid. Professor A. H. Church employed this method in arresting the decay of the frescoes in the Houses of Parliament and the stonework of the chapter house at Westminster was also treated by him in the same manner. *Fluate* is the name given to a siliceous preservative specially recommended for use upon the limestones from the Bath district. It may also be applied to other limestones, and to bricks, tiles, terra-cotta, &c. It does not materially change the appearance of the stone but enters the pores and prevents decay. Stonework that is much decayed may be restored by Tabard's Metallic Stone, which is a natural stone of trachyte origin reduced to powder. The stone is restored to its original condition by mixing the powder with an acid which softens and reunites the molecules without decomposition. The invention is of French origin and has been used for much important work on the continent of Europe and in England.

Natural Bed. The natural bed of a stone is that surface on which it was originally deposited. But volcanic and other disturbances may have occurred since that time and completely altered its "lie"; and therefore it frequently happens that a horizontal line does not coincide with the natural bed of stone as it rests in the quarry. Care must be taken, however, before using the stone in a building, to find the proper bed and to set all stones with their laminae quite level. Exceptions to this rule occur in the projecting stones of cornices and string courses, especially those with undercut members which would be likely to drop off were the natural bed level; in these cases the stones should be placed on edge with the laminae vertical, except of course at the angles of the building where the stone must be specially selected and laid on its natural bed. Limestones and sandstones which are granular in structure and are found with wide planes of cleavage, giving deep beds which can be quarried in large blocks having no tendency to split in any particular direction, are known as freestone.

Seasoning. Stone fresh from the quarry is found to contain a quantity of moisture called "quarry sap," on account of which all stones (even granite) are comparatively soft when first quarried. This water gradually evaporates, and after some months' exposure stones that were quite soft and weak when quarried acquire hardness and strength. For these reasons it is desirable from an economical point of view to "work" the stone to its desired shape and mould and carve it when soft and easily workable. By adopting this method a considerable saving in carriage will be effected, and the durability of the stone is enhanced, for the quarry sap on drying out leaves a hard outer crust or protective skin which would be removed if the working of the stone were left until it had become seasoned. It is an interesting fact that Sir Christopher Wren directed that the stones used in the erection of St Paul's Cathedral should be seasoned for three years on the sea beach.

Varieties. Building-stones are divided into several groups; limestones and sandstones are classified as aqueous or stratified rock, granite being the principal igneous or unstratified stone.

Limestones consist chiefly of calcium carbonate with small proportions of other substances. They are often classified under four heads: *Compact* limestones consist of carbonate of lime, either pure or in combination with clay and sand. *Granular* or *oolitic* limestones consist of grains of carbonate of lime cemented together by the same substance or mixed with sand and clay. The grains are egg-shaped (hence the name "oolite") and vary in size from tiny particles to grains as large as peas. *Shelly* limestones consist almost entirely of small shells, cemented together by carbonate of lime. *Magnesian* limestones are composed of carbonates of lime and magnesia in varying proportions, and usually also contain small quantities of silica, iron and alumina. Stones having less than 15% of magnesia are not classed under this head. *Dolomites* are limestones containing equal proportions of carbonate of lime and carbonate of magnesia. Many of the finest building-stones are limestones. In England typical examples are the Bath stones, Portland stone and Kentish ragstone, and in America those from the states of New York, Indiana (Bedford quarry, light brown stone), Illinois (Grafton and Chester quarries) and Kentucky (Bowling Green stone, light grey, similar to Portland). Notable French limestones are obtained from the quarries at Peuren (cream), Château-Gaillard (white), Abrots, Normandoux (white), and Villars (light brown). The hardest and closest grained of these are capable of taking a fine polish. Limestones should be used with care as they are uncertain in their behaviour and usually more difficult to work than sandstones, and as a general rule they do not stand the action of fire well. On being treated with a dilute acid, limestones will effervesce and by this test they can easily be identified. Limestones weigh between 130 ℔ and 166 ℔ per cubic foot. They vary in colour, but most of them are cream or yellowish brown. *Marble* is a limestone which has been changed by the action of heat and pressure into a crystalline form. Many beautiful varieties are found which are suitable for interior decoration, such as for columns, wall lining, paving, &c., and in dry sunny climates they may be employed with great effect in external situations. They will take a high polish and the fine grained varieties are well adapted for intricate carving. The principal supplies of marble are drawn from Italy, Belgium and France, but the marbles from Ireland and those from Devonshire and Derbyshire possess a remarkable range of colour and variety of markings. America has few notable coloured marbles; most of the stones quarried are white or black. The states of Vermont (West Rutland and Sutherland Falls quarries), Tennessee and Georgia produce large quantities of marble. *Marezzo* and *scagliola* are imitations of marbles, and their manufacture and use are described in PLASTERWORK.

Sandstones are composed of grains of sand held together by a cementing substance to form a compact rock. The cementing medium may be silica, alumina, carbonate of lime or an oxide of iron. Those stones that have a siliceous cement are the most durable. Sandstones vary more in colour than limestones, the colour being largely due to the presence of iron. Cream, brown, grey, pink, red, light and dark blue, and drab are common colours. Typical British sandstones are Corsehill (red) from Dumfriesshire, the Yorkshire sandstones (brown), Pennant stone and Forest of Dean (blue and grey) from Gloucestershire. In America sandstones are quarried in many states, principally Connecticut (brown stone), New York (Potsdam red stone), Ohio (Amherst Berea and other quarries, light brown or grey stone) and Massachusetts (Longmeadow brown stone). The texture of sandstones varies from a fine, almost microscopical, grain to one composed of large particles of sand It will generally be found that the heaviest, densest, least porous and most lasting stones are those with a fine grain.

Granites are igneous rocks formed by volcanic action and are of all geological ages. Granite is composed of quartz, felspar and mica intimately compacted in varying proportions to form a hard granular stone. Quartz is the principal constituent and imparts to the rock the qualities of durability and strength. Stones containing a large proportion of quartz are hard and difficult to work. Felspar of an earthy nature is opaque in appearance and is liable to decay; it should be clear and almost transparent. The characteristic colour of the granite is generally due to this substance, but the stone is often affected by the nature of the mica it contains, whether it be light or dark in tint. Granite is the hardest, strongest and most durable of building-stones, and is difficult and costly to work. When polished, many varieties present a beautiful and lasting surface. By reason of its strength and toughness this stone is often used for foundations, bases, columns, kerbs and paving and in all positions where great strength is required. The granites from the Peterhead and Aberdeen districts of Scotland and from Cornwall and Devonshire in England are much used. In the United States good granites are quarried in Connecticut, Massachusetts and Minnesota. Canada, especially the eastern provinces, supplies many excellent varieties of granites. Much granite is also exported from Norway and Sweden. *Syenitic granite* contains hornblende in addition to quartz, felspar and mica. True *syenite* consists of quartz, felspar and hornblende, the latter taking the place of mica. It obtains its name from a stone found at Syene in Egypt, but it has since been discovered that this stone is not a "syenite" as it actually contains more mica than hornblende. These rocks are very hard and are used more for paving and road-metalling than for building purposes.

Slates.—The slate used for roofing and other purposes in building is a fine-grained and compact rock composed of sandy clay which has been more or less metamorphosed by the action of heat and tremendous pressure. Such rocks were originally deposited in the form of sediment by the sea or river, afterwards becoming compacted by the continual heaping up of superincumbent material. Owing no doubt to some sliding motion having at some time taken place, slaty rocks are capable of being split into thin sheets which are trimmed to the various marketable sizes. A good slate is hard, tough and non-absorbent, will give out a metallic ring if struck, and when trimmed it will not splinter nor will the edges become ragged. Slates range in colour from purple to grey and green. The best-known British slates are those of the Welsh and Westmorland quarries. In America good slate is found in the states of New York, Pennsylvania and Maine. (See also ROOFS.)

Artificial Stone.

There are several kinds of artificial stone on the market, consisting of fine cement concrete placed to set in wooden or iron moulds. Although from an artistic point of view its use is not desirable, it is prepared with such care that its cheapness, strength and uniform character have led to its wide employment. One of the best-known varieties is *Victoria stone* which is composed of finely crushed Mount Sorrel (Leicestershire) granite and Portland cement, carefully mixed by machinery in the proportions of three to one, and filled into moulds of the required shape. When the blocks are set hard the moulds are loosened and the blocks placed in a solution of silicate of soda for about two weeks for the purpose of indurating and hardening them. Many manufacturers turn out a material that is practically non-porous and is able effectually to resist the corroding influence of sea air or the impure atmosphere of large towns.

Blagrove, *Marble Decoration*; W. R. Johnson, *Report on Building Stone for Extension of United States Capitol*; *Report of Committee upon the Decay of Stone at the Palace at Westminster*. (J. BT.)

STONE AGE, the term employed by anthropologists to describe the earliest stage of human civilization when man had gained no knowledge of metals, and his weapons and utensils were formed of stone, horn or bone. The term has no chronological value, as the Stone Age was earlier in some parts of the world than in others, and even to-day races exist who are still in their Stone Age. This first period of human culture has been subdivided by Lord Avebury into *Palaeolithic* and *Neolithic*, words which have been generally accepted as expressing the two stages of the rough, unpolished and the finely finished and polished stone implements. (See ARCHAEOLOGY.)

STONE-FLY, the name given to medium-sized, neuropterous insects of the family Perlidae with long flexible antennae, wide thoracic sterna and with the wings resembling, as regards size, shape and the fan-like folding of the posterior pair, those typical of the Orthoptera except that the anterior pair is membranous and not coriaceous. The immature forms, which are aquatic, carnivorous and active, are very like the adults except in the absence of wings and in their method of respiration, which is either cutaneous or effected by means of variously placed integumental tufts richly supplied with tracheae. By some authors the Perlidae are regarded as a special order, Plĕcoptera; by others as a sub-order of an order Platyptera, which contains the Termitidae and some other insects as well.

STONEHAM, a township of Middlesex county, Massachusetts, U.S.A. Pop. (1890), 6155; (1900), 6197; (1910, U.S. census), 7090. Area, 6·6 sq. m. In the township is Spot Pond, a large lake with islets, so named in 1632 by Governor John Winthrop and others who then first discovered it; it is a storage basin for the Metropolitan Water District, and supplies Medford, Melrose and Stoneham. A large part (730 acres) of the Middlesex Fells Reservation of the Metropolitan Park System is in Stoneham. The village of Stoneham, with the only post office in the township, is about 9 m. north by east of Boston, and is served by the Boston & Maine railway and by inter-urban electric lines; it has a public library. Steam power was first used in the manufacture of shoes in Stoneham by John Hill & Co., who introduced many labour-saving devices, notably the heeling machine (1862). Stoneham, long a part of Charlestown and first settled about 1668, was incorporated as a township in 1725, but its boundaries have been frequently changed since then.

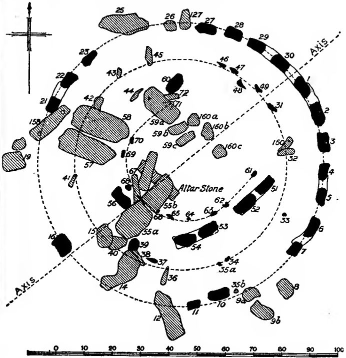
STONEHAVEN (locally *Stanehive*), a police burgh, seaport and county town of Kincardineshire, Scotland, 15 m. S.S.W. of Aberdeen by rail. Pop. (1901), 4577. It consists of two quarters, the old town picturesquely situated on the south bank of the Carron and the new on the land between this stream and the Cowie, the two being connected by the bridge which carries the main road from the south to Aberdeen. The principal buildings are the market-house and town hall, and the industries include distilling, brewing, tanning, the making of net, rope and twine and woollen manufactures. The harbour, a natural basin, is protected on the south-east by cliffs and has a quay. The trade is mostly in coal and lime and the exports are chiefly agricultural. The town is an important centre of the fishing industry, and has become a favourite watering-place. On the decay of Kincardine, the original capital, Stonehaven became the county town in 1600, and suffered heavily during the covenanting troubles, Montrose setting it on fire in 1645. The Slug Road to Banchory-Ternan, or Upper Banchory (pop. 1475), 15 m. distant, a favourite residential resort of Aberdeen citizens, begins at Stonehaven. It pursues mainly a north-western direction, at one point being carried over the shoulder of Cairn mon-earn (1245 ft.).

STONEHENGE (Sax. *Stankengist*, hanging stones), a circular group of huge standing stones (see STONE MONUMENTS), situated on Salisbury Plain, Wiltshire, England, about 7 m. N. of Salisbury. Until comparatively recent times the surrounding district was in a state of nature with merely a thin coating of turf interspersed with tufts of heath and dwarf thistles, but bare of trees and shrubs and altogether devoid of the works of man, with the exception of a series of prehistoric barrows of the Bronze Age which, singly and in groups, studded the landscape. It is safe to say that no prehistoric monument in Great Britain has given rise to more speculation as to its origin, date and purpose; and although the few hoary stones still extant are but a small portion of the original structure they are still sufficiently imposing to excite the wonder of the passing traveller, and mysterious enough to puzzle the antiquary.

Stonehenge was first mentioned by Nennius in the 9th century, who asserts that it was erected in commemoration of the 400 nobles who were treacherously slain near the spot by Hengist in 472. A similar account of its origin is given in the triads of the Welsh bards, where its erection is attributed to Aurelius Ambrosius, the successor of Vortigern. This was regarded as a miraculous feat brought about by the incantations of the magician Merlin, who caused a great stone circle in Ireland (said to have been previously carried thither out of Africa by giants) to be transported to Salisbury Plain, where, at Merlin's "word of power," all the stones moved into their proper places. On the other hand, the Welsh bard Aneurin states that Stonehenge existed before the time of Aurelius, whose title of Ambrosius may, as suggested by Davies, have been derived from Stonehenge. Geoffrey of Monmouth, in recording the death of Constantine, which took place about the middle of the 6th century (*Historia britonum*), states that he was buried "close by Uther Pendragon, within the structure of stones which was set up with wonderful art not far from Salisbury, and called in the English tongue, Stonehenge." Inigo Jones, in his work on Stonehenge, published in 1655, endeavours to prove that it was a "Roman temple, inscribed to Coelus, the senior of the heathen gods, and built after the Tuscan order." This theory was attacked by Dr Charleton (1725), one of the physicians of Charles II., who maintained that it was erected by the Danes, and consequently after the departure of the Romans from Britain. The next controversialist who appeared on the scene was the famous Dr Stukely (1740) who propounded the theory that Stonehenge, the stone circle at Avebury (Abury), &c., were temples for serpent worship, "Dracontia" as he called them, the serpent worshippers being the Druids. Subsequent writers dropped the ophite portion of this theory, but still continued to regard Stonehenge as a temple or observatory of the Druids. Lord Avebury regards it as a temple of the Bronze Age (1500–1000 B.C.), though apparently it was not all erected at one time, the inner circle of small unwrought, blue stones being probably older than the rest (*Prehistoric Times*). On the other hand James Fergusson (1872) contended that it was a sepulchral monument of the Saxon period.

The original number and position of the stones have suffered in the course of time from wind and weather, in days when archaeological interest was not alive to the importance of preserving so ancient a monument. That, however, these natural causes of its dilapidation were assisted by the sacrilegious hand of man there is no lack of documentary evidence. Thus Inigo Jones laments the disappearance of stones that were standing when he measured it; and both Stukely and Aubrey deplore the loss of fallen stones that were removed to make bridges, mill-dams and the like. On the evening of the 31st of December 1900, one of the outer trilithons (22 on plan), with its lintel, was blown down in the course of a severe storm, this being the first collapse since the 3rd of January 1797, when one of the fine trilithons (57, 58) of the horseshoe fell. This catastrophe attracted renewed attention to the state of Stonehenge, and much discussion took place as to the taking of precautions against further decay.

The annexed plan, which is that of Professor Flinders Petrie, shows the state of Stonehenge at the moment preceding the fall of the trilithon on the 31st of December 1900. Within a circular earthwork, 300 ft. in diameter and approached from the north-east by a road or avenue which can still be traced by banks of earth, is an outer circle of trilithons (100 ft. in diameter) formed by great monoliths (sarsens), originally thirty in number, with large



SCALE OF FEET

Stones standing on 30th December 1900

Stones recumbent on same date.

lintel stones. About 9 ft. within this circle and concentric with it is another, formed of smaller "blue stones," originally forty in number, but only a few of which now remain *in situ*; within that was a horseshoe of five huge trilithons formed by ten monoliths with their imposts (all sarsens); and within the horseshoe was an inner horseshoe of "blue stones," originally nineteen in number. The open part of the horseshoe exactly faces the sunrise at the summer solstice. Beyond the outer circle (not shown on plan) a great monolith—the sun stone, or so-called "Friar's Heel"—standing on the axis of the horseshoe, marks the point where a spectator, centrally placed within the horseshoe, would see the sun rise on the horizon at the solstice. On the circumference of the earthern circle or surrounding rampart (not shown on plan), which is here intentionally broken, a great recumbent stone—the slaughter stone—lies along the axis: and across the axis, near the central curve of the inner horseshoe, lies a fine recumbent stone—the altar stone—15 ft. long.

Only half the outer circle (sarsens) now remained upright, three on the west, thirteen on the east; and this indicated the effect of the prevalent west wind. The fall of trilithon 22 and its lintel opened a larger path to the wind, and added to the danger of further destruction. Moreover, the narrow passages between the eastern monoliths had become worn by use into hollows which threatened their foundations. The acquisition of Salisbury Plain by the war office for military purposes seemed likely, again, to add to the risk of harm from thoughtless visitors. For all reasons an attempt to preserve Stonehenge was desirable; and the owner, Sir Edmund Antrobus[1] was willing, on certain conditions, as to limitations of access, to co-operate with the Society of Antiquaries, Wiltshire Archaeological Society and Society for the Preservation of Ancient Monuments in taking such steps as might be necessary to prevent more stones from falling, and even (if possible) to set up some which had fallen.

[1] The ownership of Stonehenge having been questioned, Sir E. Antrobus's legal title to it was confirmed by a lawsuit in 1905.

The societies advised that trilithon 6, 7, with lintel—which had slewed round—and trilithon 56, which was leaning at a dangerous angle, should be examined with a view to replacement with as little excavation as possible; that the monolith and lintel 22 be replaced, and its companion sarsen (21) secured; and that trilithon 57, 58, should be re-erected in its place, which was exactly known. Steps were taken to place the matter in the hands of engineering experts. On the 19th of September 1901 trilithon 56 was successfully raised to a perpendicular position. It then presented an imposing appearance, standing 21 ft. above ground: its total length was found to be 29 ft. 6 in., and its weight about 30 tons. The excavations were carried to a depth of 8 ft. 3 in. below the datum line, and many objects were found, including chippings and lumps of the stones, stone tools, bones, and (in the upper strata) coins and fragments of pottery. Nearly 100 stone implements were excavated—axes, hammer axes, stone hammers and mauls—which, according to Dr Gowland, who superintended the work, had been used not only for breaking the rude blocks into regular forms, but also for working down their faces to a level or curved surface. No light was thrown, however, on the transport of the blocks.

Notwithstanding the many attempts, both by excavations and speculative writings, to elucidate the history of this unique monument, the archaeological data available are insufficient to decide definitely between the conflicting opinions held with regard to the date of its construction and the purpose for which it was originally intended. The finding of chips of " sarsens " and " blue stones " together " down to the bed of the rock " would seem to disprove the theory that the inner circle and inner horseshoe were built earlier than the rest of the monument. Dr Gowland at a meeting of the Society of Antiquaries (Dec. 19, 1901), read a paper on his recent excavations on the site of Stonehenge, in which he came to the conclusion that the structure was a temple dedicated to the worship of the sun, and he assigns its erection to the end of the Neolithic period (2000 to 1800 B.C.), on the ground that no bronze implements or relics were found during his explorations. It does not follow, however, from the fact that only stone tools were found at the bottom of the trenches that the monument was constructed when metal tools were unknown, because none of the Stonehenge tools have the characteristic forms of Neolithic implements, so that they might have been specially improvised for the purpose of roughly hewing these huge stones, for which, indeed, they were really better adapted, and more easily procured, than the early and very costly metal tools of the Bronze Age. On the other hand, the recorded discovery of iron armour, Roman and British pottery and coins, together with the bones and horns of deer and other animals, is of little evidential value without a precise record of the circumstances in which they were found. Only one object, viz. an incense burner, seems to the present writer to have any chronological value, as it is an undoubted sepulchral relic of the Bronze Age.

That the sun on midsummer day rises nearly, but not quite, in line with the " avenue " and over the Friar's Heel, has long been advanced as the chief argument in support of the theory that Stonehenge was a temple for sun-worship. On the supposition that this stone was raised to mark exactly the line of sunrise on midsummer's day when the structure was erected, it would naturally follow, owing to well-known astronomical causes, that in the course of time the direction of this line would slowly undergo a change, and that, at any subsequent date since, the amount of deviation would be commensurate with the lapse of time, thus supplying chronological data to astronomers for determining the age of the building. The solution of this problem has recently been attempted by Sir Norman Lockyer (*Stonehenge and other British Stone Monuments*), who calculates that on midsummer day, 1680 B.C., the sun would rise exactly over the Friar's Heel, and in a direct line with the axis of the temple and " avenue." The above date he therefore considers to be the date of the erection of this great national monument, within a margin of possible error, on either side, of 200 years.

Looking at Stonehenge from the architectural standpoint, there can be no hesitancy in regarding it as an advanced representative of the ordinary stone circles, some two hundred of which, great and small, are known within the British Isles. It is, however, differentiated from them all by having hewn stones, capstones, tenons and sockets. That its analogues were chiefly used as sepulchres has been fully established, and this is presumptive evidence that the sepulchral element was, at least, one of the objects for which Stonehenge was constructed: and it was probably for this reason that it was erected on Salisbury Plain, where there already existed an extensive necropolis of the Bronze Age. Nor would this by any means militate against its use as a temple for consecrating the dead, or for sun-worship, or any other religious purpose.

AUTHORITIES.—Among numerous writings on Stonehenge may be mentioned *Stonehenge and Abury*, by Dr William Stukely (1740; reprinted in 1840); Davies, *Celtic Researches* (1804), and *Mythology of the Druids* (1809); Hoare, *Ancient Wiltshire* (1812), vol. i.; Browne, *An Illustration of Stonehenge and Abury* (1823); Fergusson, *Rude Stone Monuments* (1872); Long, *Stonehenge and its Barrows* (1876); Gidley, *Stonehenge viewed in the Light of Ancient History and Modern Observation* (1877); W. M. Flinders Petrie, *Stonehenge: Plans, Descriptions and Theories* (1880); E. T. Stevens, *Jottings on Stonehenge* (1882); Edgar Barclay, *Stonehenge and its Earth Works* (1895); Lockyer, *Stonehenge and other British Stone Monuments, Astronomically Considered* (1906). See also *The Times* (April 9. 1901). For a complete bibliography of Stonehenge see *The Wiltshire Archaeological and Natural History Magazine* (Dec. 1901), by W. Jerome Harrison. (R. MU.)

STONEMAN, GEORGE (1822–1894), American soldier, was born at Busti, in Chautauqua county, New York, on the 8th of August 1822. He graduated at West Point in 1846, served as second lieutenant with the Mormon battalion in California during the Mexican War, and became a captain in 1855. In February 1861, while in command of Fort Brown, Texas, he disregarded the orders of his superior officer, Major-General D. E. Twiggs, to surrender to the Confederate forces, and escaped with the garrison. He served on McClellan's staff during the West Virginia campaign, and was commissioned brigadier-general of volunteers and appointed chief of cavalry of the Army of the Potomac in August 1861, in which capacity he took part in the Peninsula campaign and the Seven Days' Battle. He commanded the III. corps in the Fredericksburg campaign; and was promoted, in November 1862, to be major-general of volunteers. During the Chancellorsville campaign he made an unsuccessful cavalry raid toward Richmond. In the early months of 1864 he commanded the XXIII. corps, and then, as commander of the cavalry of the department of the Ohio, took part in the Atlanta campaign. While attempting to seize the Confederate prison at Andersonville (July 31, 1864), he was captured at Clinton, Georgia. After his release in October he commanded cavalry in East Tennessee, making successful raids into Virginia and North Carolina, and on the 12th of April 1865 defeated a Confederate force near Salisbury, North Carolina, and captured a large number of prisoners. Afterward he held commands in Tennessee and Virginia until 1868. He was mustered out of the volunteer service in September 1866, but served in the regular army as colonel and brevet-major-general till 1871. He then removed to California, was elected governor by the Democrats, and served from 1883 to 1887. In February 1891 he was made a colonel on the retired list, U.S. Army, and on the 5th of September 1894 died at Buffalo, New York.

STONE MONUMENTS, PRIMITIVE.—The raising of commemorative monuments of such enduring material as stone is a practice that may be traced in all countries to the remotest times. The highly sculptured statues, obelisks and other monumental erections of modern civilization are but the lineal representatives of the unhewn monoliths, dolmens, cromlechs, &c., of prehistoric times. Judging from the large number of the latter that have still survived the destructive agencies (notably those of man himself) to which they have been exposed during so many ages, it would seem that the motives which led to their erection had as great a hold on humanity in its earlier stages of development as at the present time. In giving some

idea of the characteristics of these rude and primitive monuments in Britain and elsewhere it will be convenient to classify them as follows: (1) Isolated pillars, or monoliths (μόνος, solitary, and λίθος, stone) of unhewn stones raised on end, are called *menhirs* (Cornish, *maenhir*, and Welsh *maen*, a stone, and *hir*, long). (2) When these monoliths are arranged in lines they become *alignments* (*ad*, to, and Fr. *ligne*, a line), as at Ménec, Carnac (see Plate, fig. 5). (3) But if their linear arrangement be such as to form an enclosure (enceinte), whether circular, oval or irregular, the group is designated by the name of *cromlech* (Gaelic, *crom*, crooked, and *leac*, Welsh *llech*, a flagstone), as at Carrowmore, Ireland (see Plate, fig. 4). (4) When the monoliths, instead of standing apart as in the previous structures, are placed close to each other and enclose an area sufficiently small and narrow to be roofed over by one or more capstones so as to form a rude chamber, the monument is called a *dolmen* (Breton, *dolmen*, from *dol*, a table, and *men*, Welsh *maen*, a stone). For illustrations of the dolmens at Keriaval and Kit's Coty House (see Plate, figs. 1 and 2). This megalithic chamber is sometimes wholly embedded in a mound of earth or stones so as to present to outward appearance the form of a tumulus or cairn. As, however, there are many tumuli and cairns which do not contain megalithic chambers, it is only partially that these prehistoric remains come under the category of primitive stone monuments. In the rare instances of a dolmen being constructed of two single standing stones supporting a third, like the lintel of a door, as may be seen at Stonehenge (*q.v.*), the monument is called a *trilithon* (τρι = τρεῖς, three, and λίθος, stone).

Menhirs.—Rude monoliths set on end appear to have been erected in all ages for a variety of commemorative purposes, such as on the accession of kings and chiefs, or to mark the site of a battle, a grave, or a boundary line, &c. Throughout the British Isles such standing stones are widely interspersed, especially in the less cultivated districts. In Scotland, when stones were used ceremonially in the act of crowning a king, they were called tanist stones, the most celebrated of which was the Lia Fail, formerly at Scone (now at Westminster Abbey), on which the kings of Scotland used to be crowned. We read also of hare or hoer stones, cambus or camus stones (*cam*, crooked), cat (*cath*, battle) stones, witch stanes, Druid stanes, &c. The Hawk stane, or *Saxum Falconis*, at St Madoes, Perthshire, was erected in memory of the defeat of the Danes at Luncarty, and a monolith now standing on the field of Flodden is said to mark the place where King James fell. When menhirs were grouped together their number was often significant, *e.g.* twelve (Joshua iv. 5) or seven (Herod. iii. 8). Some standing stones are found to have been artificially perforated, and with these superstition has associated some curious ceremonies. As examples of this class may be mentioned the famous Stone of Odin near the circle of Stennis, the Clach-Charra, or Stone of Vengeance, at Onich near Balachulish, Argyllshire, and Men-en-tol (the holed-stone) in Cornwall. Two rude monoliths in Scotland bear inscriptions—the famous Newton Stone in the district of Garioch, and the Cat Stane near Edinburgh. Others have cup-and-ring markings, spirals or concentric circles. In Ireland, Wales and Scotland they are occasionally found with Ogam inscriptions and in the north-east of Scotland (Pictland) with some remarkable and hitherto unexplained symbolical figures, which were continued on the hewn and elaborately sculptured stones of early Christian times so largely found in that locality. In England monoliths are often associated with the cromlechs or stone circles, as the King's Stone at Stanton Drew, Long Meg at Little Salkeld, the Ring Stone at Avebury, &c. One of the finest British monoliths stands in the churchyard of Rudston, Yorkshire.

Menhirs are found in all countries which abound in megalithic structures. In France over 1600 isolated examples have been recorded, of which about the half, and by far the most remarkable, are within the five departments which constitute Brittany. Over the rest of France they are generally small, and not to be compared in size to those of Brittany. At Locmariaquer, Morbihan, is the largest menhir in the world. It was in the form of a smooth-sided obelisk, but now lies on the ground broken into four fragments, the aggregate length of which amounts to 20·50 metres (about 67 ft.). It was made of granite foreign to the neighbourhood, and its weight, according to the most recent calculations, amounted to 347,531 kilogrammes, or 342 tons (*L'Homme*, 1885, p. 193). The next largest menhir is at Plésidy (Côtes-du-Nord), measuring about 37 ft. in height. Then follows a list of sixty-seven gradually diminishing to 16 ft. in height of which the first ten (all above 26 ft.) are in Brittany. As regards form these menhirs vary greatly. Some are cylindrical, as the well-known *pierre de champ-Dolent* at Dol (height 30 ft.), and that of Cadiou in Finistère (28 ft.); while that of Penmarch (26 ft.) takes the shape of a partially expanded fan. A menhir of quartz at Médréac (Ille-et-Vilaine) stands 16½ ft. high in the form of a rectangular pillar *indubitablement taillé*. On the introduction of Christianity into France its adherents appear to have made use of these menhirs at an early period; many of them at present support a cross, and some a Madonna. While the scattered positions of some monoliths suggest that they were sometimes used as landmarks, or perhaps as places of rendezvous for hunters, the singular grouping of others shows that these were only secondary or subsidiary functions. So far as the Ogam inscriptions, found on some of the standing stones in Scotland, Ireland and Wales, have thrown light on the subject they appear to have been the headstones of graves. It is not uncommon to find a monolith overtopping a tumulus, thus simulating the bauta (grave or battle) stones of Scandinavia. Menhirs of all sizes are also met with in Algeria, Morocco, India, Central Asia, &c.

Alignments.—The most celebrated monuments of this class are to be seen in the vicinity of Carnac in Brittany. They are situated in groups at Ménec (see Plate, fig. 5), Kermario, Kerlescant, Erdeven and Ste Barbe—all within a few miles of each other, and in the centre of a district containing the most remarkable megalithic remains in the world. The first three groups are supposed by some archaeologists to be merely portions of one original and continuous series of alignments, which extended nearly 2 m. in length in a uniform direction from south-west to north-east. Commencing at the village of Ménec the menhirs extend in eleven rows. At first they stand from 10 to 13 ft. above ground, but as we advance they become gradually smaller till they attain only 3 or 4 ft. in height, and then cease altogether. After a vacant space of about 350 yards we come to the Kermario group, which contains only ten lines, but the menhirs are nearly of the same magnitude as those at the beginning of the former group. After a still greater interval the menhirs again appear at the village of Kerlescant, but this time in thirteen rows. In 1881 M. Felix Gaillard, Plouharnel, made a plan of the alignments at Erdeven, from which it appears that, out of a total of 1120 menhirs which originally constituted the group, 290 are still standing, 740 fallen, and 90 removed. The menhirs here may be traced for nearly a mile, but their linear arrangement is not so distinct, nor are the stones so large as those at Carnac. About 50 alignments are known in France. At Penmarch there is one containing over 200 stones arranged in four rows. Others, however, are formed of only a single row of stones, as at Kerdouadec, Leuré and Camaret. The first is 480 metres in length, and terminates at its southern extremity in a kind of *croix gammée*. At Leuré three short lines meet at right angles. The third is situated on the rising ground between the town of Camaret and the point of Toulinguet. It consists of a base line, some 600 yards long, with 41 stones (others had apparently been removed), and two rectangular lines as short offsets. Close to it were a dolmen and a prostrate menhir. All these monoliths consist of a coarse quartz and are of small dimensions, only one, at Leuré, reaching a height of 9 ft. Alignments are also found in the regions flanking the Pyrenees, but here they are generally in single file—mostly straight, but sometimes reptiliform. One at Peyrelade (Billière) runs in a straight line from north to south for nearly

300 yds. and contains 93 stones, some of which are of great size. At St Columb, in Cornwall, there is one called the Nine Maidens, which consists of eight quartz stones extending in a perfectly straight line for 262 ft. In Britain, however, the alignments are more frequently arranged in a double file, or in avenues leading to, or from, other megalithic monuments, such as still exist, or formerly existed, in connexion with the cromlechs or circles at Avebury, Stonehenge, Dartmoor, Shap, Callernish, &c. The stone circle at Callernish, in the island of Lewis, shows an unusually elaborate design with two parallel rows of upright stones running northwards and a single line across, thus presenting a cruciform appearance. A very tall menhir (17 ft. long) occupies the centre of the circle (42 ft. in diameter). The peat which in the course of ages had accumulated to a depth of 5 ft. was removed in 1858, and hence the characteristic features of this remarkable monument are well seen in the Plate, fig. 3. The only example in England comparable to the great alignments of Carnac is in the vale of the White Horse, in Berkshire. Here the stones, numbering about 800, are grouped in three divisions, and extend over an irregular parallelogram measuring from 500 to 600 yds. in length and from 250 to 300 yds. in breadth. Sir Henry Dryden describes several groups of alignments in Caithness, as at Garrywhin, Camster, Yarhouse, and the "Many Stones" at Clyth (Fergusson, *Rude Stone Monuments*, p. 529). Alignments in single and multiple rows have also been observed in Shetland, India, Algeria, &c.

Cromlechs.—In Britain the use of the word cromlech is virtually synonymous with that of dolmen. In France, however, and on the Continent generally, it is exclusively applied to that class of monument for which in this country only the descriptive name of "stone circles," or "circles of standing stones," is used. This application of the term in various countries to different classes of monuments has given rise to some confusion. The earliest known use of the word occurs in Bishop Morgan's translation of the Bible into Welsh (1588), where "the clefts of the rocks" is rendered by *cromlechydd y creigiau.* Its earliest occurrence in the special sense in which it has continued to be used by British antiquaries is in a description of some ancient remains by the Rev. John Griffith of Llanddyfnan (1650), in which he says—"There is a crooked little cell of stone not far from Alaw, where according to tradition Bronwen Leir was buried; such little houses, which are common in this country, are called by the apposite name *cromlechaw.*" In this article the word cromlech retains its continental meaning and is exclusively used to indicate enclosures (enceintes) formed of rude monoliths placed at intervals of a few yards; and as such enclosures generally assume a circular, or oval, shape they are not infrequently described as stone circles. Rectangular enclosures are, however, not unknown, examples of which may be seen at Curcunno (Morbihan), near the well known dolmen of that name, and at Saint Just (Ille-et-Vilaine). The former measures 37 by 27 yds., and is now composed of 22 menhirs, all of which are standing (some fallen ones having been restored by the government), while about a dozen appear to be wanting. A "donkey-shoe-shaped" enclosure has been described by Sir Henry Dryden in the parish of Latheron, Caithness, measuring 226 ft. long, 110 ft. wide in the middle, and 85 ft. wide at the two extremities. Stone circles are frequently arranged concentrically, as may be seen in the circles at Kenmore, near Aberfeldy, Perthshire, as well as in many other Scottish, Irish and Scandinavian examples. More rarely one large circle surrounds inner groups without having a common centre, as at Avebury where the outer circle (1200 ft. in diameter) surrounded two others each of which contained an inner concentric circle. The stone circle of Ballynoe, Co. Down, Ireland, consists of inner and outer (eccentric) circles; the former measures about 57 ft. in diameter with 22 stones, and the latter 105 ft. in diameter with 45 stones. At Boscawen, in Cornwall, there is a group of circles confusedly attached and partially overlapping. Also, on the small island of Er-Lanic (near the famous tumulus of Gavr'inis), there is a double cromlech (now partially submerged), the circles of which intersect each other. Cromlechs may also be connected by alignments or avenues, as already explained; and they are often associated with other megalithic monuments. Thus, at the end of the great Carnac alignments are the remains of a large circle which can be readily traced, notwithstanding that some houses are constructed within its area. In the British Isles and in the north of Europe they frequently surround dolmens (as at Carrowmore, Ireland—Plate, fig. 4), tumuli and cairns. A few examples of a dolmen being surrounded by one or more circles have been recorded by M. Cartailhac from the department of Aveyron, in France. Outside the stone circle there is also frequently to be found a circular ditch as at Avebury, Stonehenge, Arbor Low, Ring of Brogar, &c. The most remarkable megalithic monument of this class now extant is Stonehenge, which differs, however, from its congeners in having the stones of its outer circle partially hewn and attached by transverse lintels. The largest cromlech in France was situated at the village of Kergonan, on the Ile-aux-Moines (Morbihan), about the half of it being now destroyed by the encroachment of the houses. The remaining semi-circumference contains 36 menhirs, from 6 to 10 ft. high, and its diameter is about 328 ft. This cromlech, like so many English "circles," was not circular but slightly elliptical. Only a few of the British cromlechs exceed these dimensions, among which may be mentioned Avebury (1260 by 1170 ft.), Stonehenge (outer circle 300 ft., inner 106 ft.), Stanton Drew (360 ft.), Brogar (345 ft.), Long Meg and her Daughters (330 ft.). One near Dumfries with 11 stones and 291 ft. in diameter, called the Twelve Apostles, also closely approaches what Fergusson calls the 100-metre size; but, generally speaking, the Scotch and Irish examples are of smaller proportions, rarely exceeding 100 ft. in diameter. That most of the smaller circles have been used as sepulchres has been repeatedly proved by actual excavations which showed that interments had taken place within their areas. It is difficult, however, to believe that this could have been the main object of the larger ones. At Mayborough, near Penrith, there is a circular mound entirely composed of an immense aggregation of small stones in the form of a gigantic ring and enclosing a flat area, about 300 ft. in diameter. This space is entered by a wide aperture in the ring, and near the centre there is a fine monolith, one of several known to have formerly stood there. Of the same type is the Giant's Ring, near Belfast; but the ring in this instance is made of earth and it is considerably larger in diameter (580 ft.), while the central object is a fine dolmen. It is more probable that such enclosures were used, like many of our modern churches, for the double purpose of burying the dead and addressing the living.

Dolmens.—In its simplest form a dolmen consists of three, four, or five stone supports, covered by one selected megalith called a capstone, or table. A well-known example of this kind in England is Kit's Coty House (see Plate), situated between Rochester and Maidstone, which is formed of three large supports with a capstone measuring 11 by 8 ft. From this simple form there is an endless variety of structures till we reach the so-called Giant Graves and *Grottes des Fées*, which consist of numerous supports and several capstones. The dolmen of Bagneux, situated in the corner of a plantation on the outskirts of the town of Saumur, measures 18 metres in length, 6·50 in breadth and 3 in height. It is constructed of huge flagstones, 4 on each side, and 4 capstones—the largest capstone measuring 7·50 metres in length, 7 in breadth and 1 in thickness. Another near Essé (Ille-et-Vilaine) called *La Roche aux Fées*, is constructed of 30 supports and 8 capstones, including the vestibule. Dolmens of this kind are extremely rare in the British Isles, the only one comparable to them in form being Calliagh Birra's House near Monasterboice, Ireland, which consists of 4 capstones supported by 4 or 5 thin stones on edge to form each side, and one stone closing one end. Owing to its small size (12 ft. long by 4 wide) this monument is disappointing in appearance. These free standing megalithic chambers, generally known as *allées couvertes*, as well as many other examples of the

simple dolmen, show no evidence of having been covered over with a mound. When there was a mound, it necessitated in the larger ones an entrance passage which, like the chamber, was constructed of a series of side stones and capstones. Some archaeologists maintain that all dolmens were formerly covered with a cairn or tumulus—a theory which undoubtedly derives some support from the condition of many examples still extant, especially in France, where they may be seen, as it were, in all stages of degradation from a partial to a complete state of denudation. Were the soil and stones which compose the tumulus of New Grange, Ireland, removed, leaving only the large stones which form its entrance passage and central chambers, there would be exposed to view a very imposing megalithic structure, not unlike the group of monoliths at Callernish in the Lewis (see Plate, fig. 3). The *allées couvertes* of France, Germany and the Channel Islands had their entrance at the end; but, on the other hand, those of the Drente, in Holland (Hunebedden), had both ends closed and the entrance was on the side facing the sun. The covered dolmens are extremely variable in shape—circular, oval, quadrangular and irregular being forms commonly met with; and as to size they range from that of an ordinary barrow up to that of New Grange, which rises in the form of a truncated cone to a height of 70 ft. with a diameter of 315 ft. at the base and 120 ft. at the top. Around its base was a circle of some thirty rude monoliths, placed about 10 yds. apart, and forming a circumference of 1000 ft.—only a few of these menhirs are now *in situ*. The entrance passage to the interior of this huge tumulus measures about 63 ft. long, 4 ft. 9 in. high, and 3 ft. 6 in. wide, and discloses some large blocks of stone; and its cruciform chamber measures 26 ft. long, 21 ft. broad and 19½ ft. high in the middle. The entrance gallery may be attached to the end of the chamber, as in the Grotte de Gavr'inis, or to the side, as in the Giant's Grave at Oem near Roskilde. In other instances there is no distinct chamber, but a long passage gradually widening from the entrance; and this may be bent at an angle, as in the dolmen du Rocher (Morbihan). Again, there may be several chambers communicating with one entrance passage; or, two or three chambers, having separate entrances, may be imbedded in the same tumulus. A curious specimen of the former may be seen in a ruined tumulus near St Helier, Jersey; and an excellent example of the latter is the partially destroyed tumulus of Rondosec, near Plouharnel railway station, which contains three separate dolmens. That such variations are not due to altered customs, in consequence of wideness of geographical range, is shown by de Mortillet, who gives plans of no less than 16 differently shaped dolmens (*Musée préhistorique*, pl. 58), all within a confined district in Morbihan.

Ruined dolmens are abundantly met with in the provinces of Hanover, Oldenburg and Mecklenburg. At Riestedt, near Uelzen in Hanover, there is, on the summit of a tumulus, a very singular dolmen which measures about 40 ft. long and 6 ft. wide. Another at Naschendorf, near Weimar, consists of a mound surrounded by a large circle of stones and a covered chamber on its summit. Remains of a megalithic structure at Rudenbeck, in Mecklenburg, though now very imperfect, show that originally it had been constructed like an *allée couverte*. It had four supports on each side, two at one end (the other end being open and forming the entrance), and two large capstones. The length in its completed state was about 20 ft., breadth 7½ ft., and height from the floor to the under surface of the roof 3 ft. According to Bonstetten, no less than 200 of these megalithic monuments are distributed over the three provinces Lüneburg, Osnabrück and Stade; and the most gigantic examples in Germany are in the duchy of Oldenburg. In Holland, with one or two exceptions, they are confined to the province of Drente, where between 50 and 60 still exist, under the name of Hunebedden (Huns' beds). The Borger Hunebed, the largest of the group, is 70 ft. long and 14 ft. wide. In its original condition it contained 45 stones, ten of which were capstones. All the Drente monuments are now denuded, but a few show evidences which suggest that they had formerly been surrounded by a mound containing an entrance passage. Only one dolmen has been recorded in Belgium; but in France their number amounts to 3000–4000. They are irregularly distributed over 78 departments, no less than 618 being in Brittany. In the centre of the country they are also numerous, some 435 having been recorded in Aveyron; but here they are of much smaller dimensions than in Brittany. From the Pyrenees these rude stone monuments are sparsely traced along the north coast of Spain and through Portugal to Andalusia, where they occur in considerable numbers, but of their precise numbers and distribution we have no trustworthy accounts. According to Cartailhac (*Âges préhistoriques de l'Espagne et du Portugal*, p. 152) 118 were recorded up to 1879 under the name of *antas*. Many of them are in the form of free standing dolmens and *allées couvertes*. The most remarkable monument of this kind in Spain, and certainly one of the finest in Europe, is that near the village of Antequera, some distance north of Malaga. The chamber, slightly oval in shape, measures 24 metres long, 6·15 metres broad, and from 2·70 metres to 3 metres high. The entire structure comprises 31 monoliths—ten on each side, one at the end and five on the roof. Moreover, the roof is strengthened by three pillars placed along the middle line at the widest part of the chamber. The huge stones are made of the Jurassic limestone of the district and, like those of Stonehenge, appear to have been partly dressed. The entire structure was originally, and still is partially covered by earth, which formed a mound about 100 ft. in diameter. In Africa dolmens are found in large groups in Morocco, Algeria and Tunis. General Faidherbe writes of having examined five or six thousand at the cemeteries of Bou Merzoug, l'Oued Berda, Tébessa, Gastal, &c. (*Congrès international d'anth. et d'arch. préhist.*, 1872, p. 408). In the Channel Islands every kind of megalithic monument is met with. At Mont Cochon, near St Helier, there was lately discovered in a mound of blown sand an *allée couverte* and, close to it, a stone circle surrounding a small dolmen. In the British Isles dolmens are common in many localities, particularly in the west of England, Anglesey, the Isle of Man, Ireland and Scotland. In the last named country they are not, however, the most numerous and striking remains among its rude stone monuments—the stone circles and cisted cairns having largely superseded them.

No dolmens exist in eastern Europe beyond Saxony. They reappear, however, in the Crimea and Circassia, whence they have been traced through Central Asia to India where they are widely distributed. Similar structures have also been recognized by travellers in Palestine, Arabia, Persia, Australia, Madagascar, Peru, &c. The irregular manner in which these megalithic monuments are distributed along the western parts of Europe bordering on the seashore has led to the theory that they were erected by a special people, but as to the when, whence and whither of this megalithic race we have no knowledge whatever. Although the European dolmens, however widely apart they may be situated, have a strong family likeness, yet they present some striking differences in certain localities. In Scandinavia they are confined to Danish lands and a few provinces in the south of Sweden. In the former country the exposed dolmens are often placed on artificial mounds and surrounded by cromlechs which are either circular (*runddysser*), or oval (*langdysser*). In Sweden the *sépulture à galerie* is very rarely entirely covered up as in the Giant graves of Denmark.

In the absence of historical records and scientific investigations it was formerly the custom to regard all these different varieties of primitive stone monuments as of Celtic origin. By some they were supposed to have been constructed by the Druids, the so-called priests of the Celts; and hence they have been described, especially since the time of Aubrey and Stukely, under the name of Celtic or Druidical monuments. But from more recent researches there can be no doubt that the primary object of this class of remains was sepulchral, and that the megalithic chambers with entrance passages were used as family vaults. Against the theory that any of them were ever used as altars, there is prima facie evidence in the care taken to have the smoothest and flattest surface of the stones composing the chambers always turned inwards. Moreover, cup marks and other primitive markings, when found on capstones, arc almost invariably on their underside, as at the dolmens of Keriaval, Kercado and Dol ar Marchant. Also, all the six stones forming the three-sided chamber of the great tumulus of Gavr'inis (Morbihan) and most of those in the sides of its long entrance passage (44 ft.), are elaborately sculptured with primitive incised patterns, perfectly analogous to those on the walls of the chamber of New Grange (Ireland). From its position in the centre of a large circular enclosure, as uniformly even as a garden lawn, no dolmen could be more suggestive as a place of sacrifice than that within the Giant's Ring near Belfast; yet nothing could be more inappropriate for such a purpose that its capstone, which, in fact, is nothing more than a large granite boulder presenting on its upper side an unusually rounded surface.

No chronological sequence has been detected in the construction and evolution of these primitive stone monuments; nor can their existence and special forms in different countries be said to indicate contemporaneity. The dolmens of Africa are often found to contain objects peculiar to the Iron Age, and it is said that in some parts of India the people are still in the habit of erecting menhirs, cromlechs, dolmens and other megalithic monuments. Scandinavian archaeologists assign their dolmens exclusively to the Stone Age. It would appear that, subsequent to the great chambered cairns of the Stone Age, a period of degradation in this kind of architecture occurred in Britain when the Bronze Age barrows replaced the dolmens, and these again gave way to simple burial in the earth. In Scandinavia the megalithic chamber seems to have been discarded in the Iron Age for burials, either by cremation or inhumation under huge tumuli, as may be seen in the three great mounds of Thor, Odin and Freya at Gamla Upsala, and the ship-barrow at Gokstad on the Sandefiord, the scene of the discovery of the Viking ship now exhibited in the museum at Christiania.

Just on the borderland between the works of nature and art comes the so-called Rocking-Stone (*Logan*, or *Loggan*, stone, French, *pierre branlante*), which usually is nothing more than an erratic, ice-transported boulder, poised so nicely over a rocky bed that gentle pressure with the hand may cause it to rock or oscillate. Such stones appear to be sparsely distributed over the whole area occupied by the primitive stone monuments, and, being very large, they were pre-eminently calculated to awaken astonishment in the minds of the worshippers of the mysterious works of nature. Hence the important position assigned to them in the Druidical worship invented by Stukely and other antiquaries of the 18th century. Some rocking-stones are evidently artificial, having had the rock cut underneath them, leaving in each a pivot-like prominence on which the block rests; but, on the other hand, natural causes can produce similar results, the stone itself acting like an umbrella to protect the central portion of the bed while weathering outside is going on all around. The same process is often well illustrated on moraine-bearing glaciers where a huge stone may be seen resting on a pillar of ice several feet in height. That man sometimes imitated such striking natural phenomena is quite probable, and to this extent rocking-stones come within the category of primitive stone monuments.

STONE RIVER, BATTLE OF, a battle of the American Civil War, called the battle of Murfreesboro by the Confederates, fought on the 31st of December 1862 and the 2nd of January 1863. After his appointment in October to command the Army of the Cumberland, General W. S. Rosecrans with Chattanooga as his objective moved from Nashville upon General Braxton Bragg, who left the winter quarters he had established at Murfreesboro and met the Union army on Stone river immediately north of Murfreesboro, on the last day of December. The plan of attack on each side was to crush the enemy's right. Bragg's left, commanded by Lieut.-General W. J. Hardee, overlapped and bore back the Union right under Major-General A. McD. McCook, and Major-General T. L. Crittenden commanding the Union left was hurriedly called back from his attack on the Confederate right to support McCook. The Union right was crumpled up on the centre, where Major-General G. H. Thomas's corps checked the Confederate attack. There was practically no fighting on the 1st of January, but on the 2nd the Confederates renewed the attack, Major-General J. C. Breckinridge with Bragg's right attempting in vain to displace Crittenden's division on high ground above the river. On the night of the 3rd Bragg withdrew and the Union army occupied Murfreesboro. Tactically a drawn battle, Stone River was strategically a Union victory. The losses on both sides were heavy: of 37,712 Confederates present for duty, 1294 were killed, 7945 were wounded, and about 2500 were missing; and of 44,800 Union soldiers present for duty, 1677 were killed, 7543 were wounded and 3686 were missing.

STONINGTON, a township of New London county, Connecticut, U.S.A., in the S.E. corner of the state, on Long Island Sound. Pop. of the township (1900), 8540 (of whom 1968 were foreign-born), (1910), 9154, including that of the borough of Stonington, 2083. Stonington is served by the New York, New Haven & Hartford railway, which has repair shops here, by an electric line connecting with New London, Conn., and Westerly, Rhode Island, and, in summer, by steamer to Watch Hill and Block Island. Its harbour is excellent, and it is a port of entry, but its foreign trade is unimportant. The township covers an area of about 45 sq. m., and includes, besides the borough of Stonington, the villages of Mystic, Old Mystic and Pawcatuck (which is closely allied with Westerly, Rhode Island). Among the manufactures of the township are foundry and machine-shop products, printing presses, silk machinery, fertilizers, spools, thread and cotton, and woollen, silk and velvet goods. Ship building and fishing are among the industries. After its settlement in 1649 and the years immediately succeeding by English planters from Rehoboth in Plymouth Colony (to whom a monument was erected in 1889 in Wequetequock Burying Ground), the territory now included in Stonington township was first a part of New London township, and then (1658), in accordance with a boundary decision of the United Colonies of New England, a part (under the name of Southertown) of Suffolk county, Massachusetts, finally reverting to Connecticut in accordance with the new boundaries fixed by the Connecticut royal charter in 1662. In 1664 it gained representation in the General Court of Connecticut; in 1665 the name was changed to Mystic, and in 1666 to Stonington. In the 18th century the village (now the borough) of Stonington (settled in 1752) developed a brisk trade with Boston, Plymouth and the West Indies. Whaling and sealing were for many years important industries and a whaling captain of Stonington, Nathaniel B. Palmer, early in the 19th century, discovered Palmer Land in the Antarctic. The village was the seat of military stores during the War of Independence, and was bombarded by a British frigate in August 1775. In August 1814 another British attack, by a squadron under Commander Thomas M. Hardy, was successfully resisted. The borough of Stonington, the first in the state, was incorporated in 1801.

See R. A. Wheeler, *History of the Town of Stonington* (New London, 1900).

STONY POINT, a township in Rockland county, New York, U.S.A., on the west bank of the Hudson river, containing a village of the same name which is 35 m. N. of New York City and 12 m. S. of West Point. Pop. of the township (1890) 4614; (1900), 4161; (1905), 3862, (1910), 3651. Area, about 30 sq. m. The village is served by the West Shore and the New York, Ontario, and Western railways. Other villages in the township are Grassy Point, where, as in Stony Point, brick-making is the principal industry; Tomkins Cove, where there are stone crushing works; and Jones Point, which has a trade in gravel, building sand and crushed stonc. The surface of the township is rough—Dunderberg (1090 ft.) and Bear Mountain (1350 ft.) are the principal eminences, and there is good farming land only at the margin of the river. The township was named from a rocky promontory which juts into the river in the north-east part of the township and rises precipitously on all sides to a height of about 140 ft. above the river. A small part of the promontory is under the jurisdiction of the United States Government which has erected a lighthouse here, and the remaining portion was bought by the state in 1897 for a state battlefield reservation, and has been laid out as a public park. At the entrance to the park is a Memorial Arch (1909), designed by H. K. Bush-Brown and presented to the state by the Daughters of the American Revolution. On Iona Island in the north part of the township is a United States naval magazine. The promontory guards the lower passage to the Highlands of the Hudson, and during the War of Independence, when the King's Ferry between it and Verplanck's Point on the opposite bank was part of an important line of communication between the New England and the Middle States, it was of considerable strategic importance. The Americans occupied it in November 1776, and about two years later erected a blockhouse upon it. The garrison, however, was very small, and on the 31st of May 1779, it was taken by the British, who immediately erected much stronger fortifications. On the night of the 15th/16th of July it was recovered by General Anthony Wayne, in command of about 1350 picked American troops, the garrison (under Lieut.-Colonel Henry Johnson) losing 63 in killed, 70 in wounded, and 543 in captured. The American loss was only 15 killed and 83 wounded. The Americans, however, had no thought from the first of holding the place and evacuated it on the 18th of July. The British immediately reoccupied it, and erected stronger fortifications, but late in October they, too, abandoned it. In the "old Treason House" in the township General Benedict Arnold and Major John André met before daylight on the 22nd of September 1780, to settle upon plans for the surrender of West Point by Arnold to the British.

See H. P. Johnston, *The Storming of Stony Point* (New York, 1900); H. B. Dawson, *The Assault on Stony Point* (Morrisania, N. Y., 1863); E. H. Hall and F. W. Halsey, *Stony Point Battle-Field* (New York, 1902); and D. Cole and E. Gay, *History of Rockland County* (ibid. 1884).

STOOL, a low seat without back or arms. The stool is an ancient piece of furniture which came into use when the need began to be felt for a seat more easily portable than heavy settles and benches—the chair was an appanage of rank and dignity to which no ordinary person dreamed of aspiring. Since it could also be used as a small table, it quickly became common. In the First Book of *The Task* William Cowper gives a sketch of the evolution of the stool which, for all its vapidity, is reasonably exact:—

> "Joint stools were then created, on three legs
> Upborn they stood. Three legs upholding firm
> A massy slab, in fashion square or round.
>
> * * * * * * *
>
> At length a generation more refinèd
> Improved the simple plan; made three legs four,
> Gave them a twisted form vermicular,
> And o'er the seat, with plenteous wadding stuff'd,
> Induc'd a splendid cover, green and blue,
> Yellow and red, of tap'stry richly wrought,
> And woven close, or needle-work sublime."

"Joint" or "joyned-stool" simply meant that the parts were joined or framed together with mortise and tenon. The wooden four-legged, square or oblong variety is often called a "coffin-stool." It may be perfectly true that it was used for supporting coffins, but that was merely one—and a very occasional one—of many uses, and the name is an entire misnomer. The round three-legged stool was a primitive construction, destitute of ornament and rudely, as well as heavily, made. By the middle of the 16th century stools had acquired four legs, braced together by stretchers, and the frame was often well carved. As the Renaissance impulse waned, forms relapsed into cumbrous and unadorned, and, so far as the oak stool of the yeoman and the farmer was concerned, little ornamentation was attempted after the middle of the 17th century. These seats continued to be made until about the end of that period—until, indeed, the increasing cheapness of the chair and the growth of habits of comfort caused it to fall into disuse. Towards the end of the Stuart period the upholstered stool reached England from France. It was not entirely unknown at an earlier date, but what had been an occasional luxury then became a common plenishing of the houses of the rich. The legs and stretchers took the "twisted form vermicular" of which the poet speaks—so far as their underframing was concerned these stools were, to all intents and purposes, chairs. Thenceforward, indeed, they followed very closely the fashions in seats with backs, acquiring the cabriole leg, the claw and ball or pad feet, the carved knees and other characteristics of chairs. The footstool is probably more ancient than the stool itself. The ducking-stool was a contrivance whereby scolding or drunken women could be ducked in a pond without danger. The stool of repentance was reserved, chiefly in Scotland, for the public penance of persons who had offended against morality. The "cutty-stool," which Jenny Geddes threw—or, according to Dr Hill Burton, did not throw—at the beginning of the riotous protests against Laud's Liturgy in St Giles's Church, Edinburgh, in 1637, was of the fald-stool variety. "Cutty" simply means short. A fald-stool was originally a folding stool used chiefly for ecclesiastical purposes. Eventually, while retaining the old name, it became rigid, and the designation has now been extended to a litany-desk. The camp-stool is immediately derived from the original form of the fald-stool. In France under the *ancien régime*, the stool, or *tabouret*, acquired a social and courtly significance of the first importance. The wives of princes, dukes, and a few of the highest dignitaries of the realm alone had the right to occupy a *tabouret* in the presence of the king, and ladies who became widows used every expedient of intrigue to retain a privilege which they regarded as the summit of earthly felicity. The *prise du tabouret*, when a lady first took possession of her seat, was an occasion of considerable ceremony.

STOOL-BALL, a game formerly very popular in England, and commonly considered as the ancestor of cricket. Joseph Strutt, writing in 1801, says of it: "I have been informed that a pastime called stool-ball is practised to this day in the northern parts of England, which consists simply in setting a stool upon the ground, and one of the players takes his place before it, while his antagonist, standing at a distance, tosses a ball with the intention of striking the stool, and this it is the business of the former to prevent by beating it away with the hand, reckoning one to the game for every stroke of the ball; if, on the contrary, it should be missed by the hand and touch the stool, the players change places; the conqueror at this game is he who strikes the ball most times before it touches the stool. I believe the same also happens if the person who threw the ball can catch and retain it when driven back, before it touches the ground." Some variety of the game, with modifications due to the development of cricket, has probably been played even since these days.

STOPPANI, ANTONIO (1824–1891), Italian geologist and palaeontologist, was born at Lecco on the 24th of August 1824. He became professor of geology in the Royal Technical Institute of Milan, and was distinguished for his researches on the Triassic and Liassic formations of northern Italy. Among his works were *Paléontologie Lombarde* (1858–1881); *Les pétrifactions d'Ésino* (1858–1860); *Géologie et paléontologie des conches à Avicula Contorta en Lombardie* (1860–1865); *Corso di geologia*, (3 vols., 1871–1873); and *L'Era Neozoica* (1881). In this last work the author discussed the glaciation of the Italian Alps and the history of Italy during the Pleistocene age. He died at Milan on the 1st of January, 1891.

STORACE, STEPHEN (1763–1796), English musical composer, was born in London in 1763. His father, Stefano Storace, an Italian contrabassist, taught him the violin so well that at ten years old he played successfully the most difficult music of the day. After completing his education at the Conservatorio di Sant' Onofrio, at Naples, he produced his first opera, *Gli Sposi malcontenti*, at Vienna, in 1785. Here he made the acquaintance of Mozart, in whose *Nozze di Figaro* his sister, Anna Selina Storace, first sang the part of Susanna. Here also he produced a second opera, *Gli Equivoci*, founded on Shakespeare's *Comedy of Errors*, and a "Singspiel" entitled *Der Doctor und der Apotheker*. But his greatest triumphs were achieved in England, whither he returned in 1787. After creating a favourable impression by bringing out his "Singspiel" at Drury Lane, under the title of *The Doctor and the Apothecary*, Storace attained his first great success in 1789, in *The Haunted Tower*, an opera which ran for fifty nights in succession. *No Song, No Supper* was equally successful in 1790; and *The Siege of Belgrade* scarcely less so in 1791. The music of *The Pirates*, produced in 1792, was partly adapted from *Gli Equivoci*, and is remarkable as affording one of the earliest instances of the introduction of a grand *finale* into an English opera. These works were followed by some less successful productions; but *The Cherokee* (1794) and *The Three and the Deuce* (1795) were very favourably received, and the music to Colman's play, *The Iron Chest*, first performed on the 12th of March 1796, created even a greater sensation than *The Haunted Tower*. This was Storace's last work. He caught cold at the rehearsal, and died on the 19th of March 1796.

The character of Storace's music is pre-eminently English; but his early intercourse with Mozart gave him an immense advantage over his contemporaries in his management of the orchestra, while for the excellence of his writing for the voice he was no doubt indebted to the vocalization of his sister Anna. This lady was born in London in 1766, completed her education at Venice under Sacchini, sang for Mozart at Vienna, and first appeared at the King's Theatre in London in 1787. After contributing greatly to the success of *The Haunted Tower* and her brother's later operas, she crowned a long and brilliant career by winning great laurels at the Handel Commemoration at Westminster Abbey in 1791, retired from public life in 1808, and died on the 24th of August 1817. During her stay in Vienna she married John Abraham Fisher, a celebrated violinist; but he used her so cruelly that she refused to bear his name, and in her will—bequeathing property to the amount of £50,000—styled herself "spinster."

STORE (from O. Fr. *estor* or *estoire*, Late Lat. *staurum* or *instaurum*, stock, provisions, supply, from the late use of *instaurare*, to provide, properly to construct, renew, restore), a stock or supply of provisions, goods or other necessaries kept for future daily or recurrent use or for a specific purpose; thus the term applies equally to the domestic supply of provisions, &c., and to the accumulated stock of arms, ammunition, clothing, food, &c., kept for the general use of a navy or army. A common secondary meaning is that of the place where a supply or stock is kept, a storehouse, and thus the term is used particularly in the country districts of America for the general shop where goods of all kinds are sold by retail. In English the term "stores" has come into use for large general shops with many departments selling all kinds of goods.

STOREY (equivalents are Fr. *étage*, Ital. *piano*, Ger. *Stock*), the term in architecture given to the floor of a building, and employed generally when referring to a number of floors one above the other; thus a building may be of two, three or more storeys high. It used to be applied to a series of apartments on one floor, which are now generally known as a flat. "Storey" or "story" is from O. Fr. *estorée*, building, *estorer*, to build, equip, furnish, store, from Lat. *staurare*, only seen in compound *instaurare*, to repair, restore, ultimately from root *sta*, to stand. "Story," a tale or narrative, is a shortened form of "history."

STORK (A. S. *storc*, Ger. *Storch*), the *Ciconia alba* of ornithology, a well-known bird, which, however, though often visiting Britain, has never been a native or even inhabitant of that country. It is a summer visitor to most parts of the European continent—the chief exceptions being France (where the native race has been destroyed), Italy and Russia—breeding from southern Sweden to Spain and Greece, and being especially common in Poland.[1] It reappears again in Asia Minor, the Caucasus, Persia and Turkestan, but farther to the eastward it is replaced by an allied species, *C. boyciana*, which reaches Japan. Though occasionally using trees (as was most likely its original habit) for the purpose, the stork most generally places its nest on buildings,[2] a fact familiar to travellers in Denmark, Holland and Germany, and it is nearly everywhere a cherished guest, popular belief ascribing good luck to the house to which it attaches itself.[3] Its food, consisting mainly of frogs and insects, is gathered in the neighbouring pastures, across which it may be seen stalking with an air of quiet dignity; but in the season of love it indulges in gestures which can only be called grotesque—leaping from the ground with extended wings in a kind of dance, and, absolutely voiceless as it is, making a loud noise by the clattering of its mandibles. At other times it may be seen gravely resting on one leg on an elevated place, thence to sweep aloft and circle with a slow and majestic flight. Apart from its considerable size—and a stork stands more than three feet in height—its contrasted plumage of pure white and deep black, with its bright red bill and legs, makes it a conspicuous and beautiful object, especially when seen against the fresh green grass of a luxuriant meadow. In winter the storks of Europe retire to Africa—some of them, it would seem, reaching Cape Colony—while those of Asia visit India. A second species, with much the same range, but with none of its relative's domestic disposition, is the black stork, *C. nigra*, of which the upper parts are black, brilliantly glossed with purple, copper and green, while it is white beneath—the bill and legs, with a patch of bare skin round the eyes, being red. The bird breeds in lofty trees, generally those growing in a large forest. Two other dark-coloured, but somewhat abnormal, species are the purely African *C. abdimii* and the *C. episcopus*, which has a wider range, being found not only in Africa but in India, Java and Sumatra. The New World has only one true stork, *Dissura maguari*, which inhabits South America, and resembles not a little the *C. boyciana* above mentioned, differing therefrom in its greenish-white bill and black tail. Both these species are very like *C. alba*, but are larger and have a bare patch of red skin round the eyes.

The storks form the family Ciconiidae, and together with the ibises (Ibididae) are now ranked as a sub-order of Ciconiiform birds (see BIRD). There is no doubt that they include the jabiru (*q.v.*) and its allies, as well as the curious genus *Anastomus* (known in India as the "open-bill," because its lower mandible is hollowed out so as only to meet the maxilla at the base and the tip), of which there are an African and an Asiatic species. In all the storks the eggs are white and pitted with granular depressions. (A. N.)

STORM, THEODOR WOLDSEN (1817–1888), German poet and novelist, was born at Husum, in Schleswig, on the 14th of September 1817. Having studied jurisprudence at Kiel and Berlin, where he formed a close friendship with the brothers Theodor and Tycho Mommsen, he settled in his native town as advocate; but, owing to his German sympathies, lost his post in 1853. Entering the Prussian service as assessor at Potsdam, he was appointed district judge at Heiligenstadt. After the

[1] In that country its numbers are said to have greatly diminished since about 1858, when a disastrous spring storm overtook the homeward-bound birds. The like is to be said of Holland since about 1860.

[2] To consult its convenience a stage of some kind, often a cart-wheel, is in many places set up and generally occupied by successive generations of tenants.

[3] Its common Dutch name is *Ooijevaar*, which can be traced through many forms (Koolmann, *Wörterb. d. ostfries. Sprache*, i. 8, *sub voce* "Adebar") to the old word *Odeboro* ("the bringer of good"). In countries where the stork is abundant it enters largely into popular tales, songs and proverbs, and from the days of Aesop has been a favourite in fable.

Danish War of 1864 Storm returned to Husum, and after filling various judicial appointments in the district, retired on a pension and died at Hademarschen on the 4th of July 1888. Storm is hardly less remarkable as a lyric poet than as a novelist. As the former, he made his début, with the two Mommsens, with *Liederbuch dreier Freunde* (1843); but his *Gedichte* (1852; 12th edition, 1900) first obtained for him general recognition. As a novelist he gained his first great success with *Immensee* (1852; 51st edition, 1901); and this was followed by numerous other short stories. He was never weary of painting the scenes of rustic simplicity and the quiet joys of the simple life. He is at his best when dealing retrospectively with episodes and incidents from his own earlier life. Later he passed to psychological problems with *Aquis submersus* (1877) and *Zur Chronik von Grieshuus* (1884), and made a deep impression with his fantastic *Schimmelreiter* (1888).

Storm's *Gesammelte Schriften* appeared in 19 vols. between 1868 and 1889; new edition in 8 vols. (1898). His correspondence with E. Mörike was published in 1891, with G. Keller in 1904. See E. Schmidt, *Charakteristiken*, i. (1886); also P. Schütze, *Theodor Storm, sein Leben und seine Dichtung* (1887); F. Wehl, *Theodor Storm, ein Bild seines Lebens und Schaffens* (1888); A. Biese, *Th. Storm und der moderne Realismus* (1888); and P. Remer, *Theodor Storm als norddeutscher Dichter* (1897).

STORM (in O. Eng. *storm*, and so in Du. and Low Ger.; in O. H. Ger. and mod. Ger. *Sturm*; the root is probably that seen in "stir," to rouse, move, disturb, cf. Ger. *stören*), a disturbance of the atmosphere, accompanied by high winds or by heavy falls of rain, hail or snow, together with thunder and lightning. The word is not a part of scientific terminology, such terms as "area of low pressure" and "cyclone" being used. In the Beaufort scale (*q.v.*) the wind-force of a storm is estimated at 10–11 and the limit of velocity at from 56 to 75 m. per hour. (See METEOROLOGY, and for magnetic storms MAGNETISM, TERRESTRIAL.)

STORNOWAY (Norse, *Stjarna vagr*, "Stjarna's Bay"), the chief and largest town in the western islands and also the principal town of the county of Ross and Cromarty. Pop. (1901), 3852. It is situated on the east coast of Lewis, at the head of a capacious harbour with ample quays and wharves, accessible at all tides and available for steamers of 3000 tons burden. The harbour is protected by two headlands, on the more southerly of which—Arnish Point—stands a lighthouse. From the end of this point there juts out a line of rocks on the extremity of which a beacon, 32 ft. high, has been erected, which is illuminated by means of a light thrown on to a prism in the lantern from the light in the lighthouse. Stornoway was made a burgh of barony by James VI., and is also a police burgh. It is the centre of the Outer Hebrides fishery district, and during the herring season the population is trebled. Among the public buildings are Lewis Hospital, Mossend Hospital, the Court House, the Drill Hall, the Masonic Hall, a commodious structure in which the public library is housed, and the fish mart. Stornoway Castle, overlooking the town from a height on the west side, is a handsome castellated mansion in the Tudor style, built as the residence of Sir James Matheson.

STORRS, RICHARD SALTER (1821–1900), American Congregational clergyman, was born in Braintree, Massachusetts, on the 21st of August 1821. He bore the same name as his grandfather (1763–1819), pastor at Long Meadow, Massachusetts, from 1785 to 1819, and his father (1787–1873), pastor at Braintree, Massachusetts, from 1811 to 1873 (except the years 1831–1836), both prominent Congregational ministers, who were descendants of Richard Mather. He graduated at Amherst in 1839, studied law in Boston under Rufus Choate, graduated at Andover theological seminary in 1845, and was pastor of the Harvard Congregational church of Brookline, Massachusetts, in 1845–1846, and of the Church of the Pilgrims in Brooklyn, New York, from 1846 until shortly before his death in Brooklyn on the 5th of June 1900. He was a conservative in theology, and an historical writer of considerable ability. From 1848 to 1861 he was associate editor of the New York *Independent*, which he had helped to establish; from 1887 to 1897 he was president of the American board of commissioners for foreign missions, and he was prominent in the Long Island Historical Society. His great-grandfather, John Storrs (1735–1799), a chaplain in the Continental Army, had been pastor of the Southold Church in 1763–1776 and in 1782–1787. Dr Storrs's more important published works were: *John Wycliffe and the First English Bible* (1880), *The Recognition of the Supernatural in Letters and in Life* (1881), *Bernard of Clairvaux* (1892), and *Foundation Truths of American Missions* (1897).

See Charles Storrs, *The Storrs Family* (New York, 1886).

STORY, JOHN (*c.* 1510–1571), English martyr, was educated at Oxford, where he became lecturer on civil law in 1535, being made later principal of Broadgates Hall, afterwards Pembroke College. He appears to have disavowed his Roman Catholic opinions just after the accession of Edward VI., but having been chosen a member of parliament in 1547 he gained notoriety by his opposition to the act of uniformity in 1548. For crying out "Woe unto thee, O land, when thy king is a child," he was imprisoned by the House of Commons, but he was soon released and went into exile. Returning to England in 1553, he resigned his position at Oxford, which was now that of regius professor of civil law, and was made chancellor of the dioceses of London and of Oxford and dean of arches. Queen Mary being now on the throne, Story was one of her most active agents in prosecuting heretics, and was one of her proctors at the trial of Cranmer at Oxford in 1555. Under Elizabeth he was again returned to parliament, but in 1560 he underwent a short imprisonment for boasting about his work in the former reign. In 1563 he was again arrested, but managed to escape to Flanders, where he became a pensioner of Philip II. of Spain. The duke of Alva authorized him to exclude certain classes of books from the Netherlands and, in 1570, while engaged in this work, he was decoyed on to a ship at Antwerp and conveyed to Yarmouth. In spite of his claim that he was a Spanish subject, he was tried for high treason, and executed at Tyburn on the 1st of June 1571. In 1886 Story was beatified by papal decree.

STORY, JOSEPH (1779–1845), American jurist, was born at Marblehead, Massachusetts, on the 18th of September 1779. He graduated at Harvard in 1798, was admitted to the bar at Salem, Mass., in 1801, and soon attained eminence in his profession. He was a member of the Democratic party, and served in the Massachusetts House of Representatives in 1805–1808, and in 1810–1812 for two terms as speaker, and was a representative in Congress from December 1808 to March 1809. In November 1811, at the age of thirty-two, he became, by President Madison's appointment, an associate justice of the United States Supreme Court. This position he retained until his death. Here he found his true sphere of work. The traditions of the American people, their strong prejudice for the local supremacy of the states and against a centralized government, had yielded reluctantly to the establishment of the Federal legislative and executive in 1789. The Federal judiciary had been organized at the same time, but had never grasped the full measure of its powers. Soon after Story's appointment the Supreme Court began to bring out into plain view the powers which the constitution had given it over state courts and state legislation. The leading place in this work belongs to Chief Justice John Marshall, but Story has a very large share in that remarkable series of decisions and opinions, from 1812 until 1832, by which the work was accomplished. In addition to this he built up the department of admiralty law in the United States courts; he devoted much attention to equity jurisprudence, and rendered invaluable services to the department of patent law. In 1819 he attracted much attention by his vigorous charges to grand juries, denouncing the slave trade, and in 1820 he was a prominent member of the Massachusetts Convention called to revise the state constitution. In 1829 he became the first Dane Professor of Law at Harvard University, and continued until his death to hold this position, meeting with remarkable success as a teacher and winning the affection of his students, whom he imbued with much of his own enthusiasm. He died at

Cambridge, Mass., on the 10th of September 1845. His industry was unremitting, and, besides attending to his duties as an associate justice and a professor of law, he wrote many reviews and magazine articles, delivered various orations on public occasions, and published a large number of works on legal subjects, which won high praise on both sides of the Atlantic.

Among his publications are: *Commentaries on the Law of Bailments* (1832); *Commentaries on the Constitution of the United States* (3 vols., 1833), a work of profound learning which is still the standard treatise on the subject; *Commentaries on the Conflict of Laws* (1834), by many regarded as his ablest work; *Commentaries on Equity Jurisprudence* (2 vols., 1835–1836); *Equity Pleadings* (1838); *Law of Agency* (1839); *Law of Partnership* (1841); *Law of Bills of Exchange* (1843); and *Law of Promissory Notes* (1845). He also edited several standard legal works. His Supreme Court decisions may be found in Cranch's, Wheaton's and Peters's *Reports*, his Circuit Courts decisions in Mason's, Sumner's and Story's *Reports*. His *Miscellaneous Writings*, first published in 1835, appeared in an enlarged edition (2 vols. in 1851).

See *The Life and Letters of Joseph Story* (2 vols., Boston and London, 1851), by his son, W. W. Story.

STORY, ROBERT HERBERT (1835–1907), Scottish divine, principal of Glasgow University, was born on the 28th of January 1835 at Rosneath, Dumbartonshire. He was educated at the universities of Edinburgh, St Andrews and Heidelberg. In 1859 he was assistant minister at St Andrew's Church, Montreal, and in February 1860 was inducted as minister of Rosneath in succession to his father. In 1887 he removed to Glasgow as professor of church history; he had also been appointed in 1886 to a chaplaincy to Queen Victoria. In 1898 he became principal of the university in succession to John Caird. He was moderator of the General Assembly in 1894, and its principal clerk from that year till his death on the 13th of January 1907. Story was a staunch supporter of his Church, and had little sympathy for schemes of reunion with the other Presbyterian communities. He vigorously opposed the action of Bishop Welldon, then metropolitan of Calcutta, in excluding Scottish chaplains and troops from the use of garrison churches in India because these had received episcopal consecration. He was characterized by an absolutely fearless honesty, which sometimes gave offence, but at the basis of his nature there was a warm, tender and sympathetic heart, incapable of meanness or intrigue. In addition to lives of his father (1862), Professor Robert Lee (1870) and William Carstares (1876), he published a devotional book *Christ the Consoler*; a volume of sermons, *Creed and Conduct* (1878); *The Apostolic Ministry in the Scottish Church* (Baird Lecture, 1897), and several pamphlets on church questions.

See *Principal Story, a Memoir by his Daughters* (1909).

STORY, WILLIAM WETMORE (1819–1895), American sculptor and poet, son of the jurist, Joseph Story, was born at Salem, Massachusetts, on the 12th of February 1819. He graduated at Harvard College in 1838 and at the Harvard Law School in 1840, continued his law studies under his father, was admitted to the Massachusetts bar, and prepared two legal treatises of value—*Treatise on the Law of Contracts not under Seal* (2 vols., 1844) and *Treatise on the Law of Sales of Personal Property* (1847). Abandoning the law, he devoted himself to sculpture, and after 1850 lived in Rome, whither he had first gone in 1848, and where he was intimate with the Brownings and with Landor. He died at Vallombroso, Italy, on the 7th of October 1895. He was a man of rare social cultivation and charm of manner, and his studio in Rome was a centre for the gathering of distinguished English and American literary, musical and artistic people. During the American Civil War his letters to the *Daily News* in December 1861 (afterwards published as a pamphlet, "The American Question," *i.e.* of neutrality), and his articles in *Blackwood's*, had considerable influence on English opinion. One of his earliest works in sculpture was a statue of his father, now in the memorial chapel of Mount Auburn Cemetery, Cambridge, Mass.; others are "Cleopatra" (of which there is an enthusiastic description in Hawthorne's *Marble Faun*) and "Semiramis" in the Metropolitan Museum of Art, New York; the "Libyan Sibil," "Saul," "Sardanapalus," "Judith," "Delilah," "Jerusalem Desolate," "Alcestis," "Medea," "Electra," "Nemesis," "Sappho" and other ideal figures; and portraits of George Peabody, erected in 1869 in London (a replica in bronze being in Baltimore, Maryland); President Quincy of Harvard, at Cambridge, Mass.; Colonel Prescott, at Bunker Hill; Edward Everett, Public Gardens, Boston, Mass.; Chief Justice Marshall, on the west terrace of the Capitol, and Professor Henry for the Smithsonian Institution, Washington; and Francis Scott Key, San Francisco. Among his writings, in addition to the legal treatises mentioned above, are *Life and Letters of Joseph Story* (1851), *Roba di Roma* (1862), *Proportions of the Human Figure* (1866), *Fiammetta* (1885), a novel, *Conversations in a Studio* (1890), *Excursions in Art and Letters* (1891), and several volumes of poems of considerable merit. His poems were collected in two volumes in 1885. Among the longer are "A Roman Lawyer in Jerusalem" (a rehabilitation of Judas Iscariot), "A Jewish Rabbi in Rome," "The Tragedy of Nero" and "Ginevra di Siena." The last named, with "Cleopatra," was included in his *Graffiti d'Italia*, a collection published in 1868.

His son, JULIAN STORY (1857–), the portrait painter, was a pupil of Frank Duveneck, and of Boulanger and Lefebvre in Paris, and became a member of the Society of American Artists, 1892, a chevalier of the Legion of Honour, Paris, 1901, and an associate of the National Academy of Design. He married in 1891 Emma Eames (b. 1867), the operatic prima donna, who secured a divorce in 1907.

See also Henry James, *William Wetmore Story and his Friends* (2 vols., London, 1903).

STOSS, VEIT (1438 or 1440–1533), German sculptor and wood carver, was born in Nuremberg. In 1477 he went to Cracow, where he was actively engaged until 1499. It was here that he carved the high altar for the Marienkirche, between 1477 and 1484. On the death of King Kasimir IV. in 1492 Stoss carved his tomb in red marble for the cathedral in Cracow. To the same date is ascribed the marble tombstone of the archbishop Zbigniew Ollsnicki in the cathedral at Gnesen; and soon after this he executed the Stanislaus altar for the Marienkirche at Cracow. In 1496 he returned to Nuremberg, where he did a great deal of work in completing altars. His main works are: a relief with the Coronation of the Blessed Virgin in the Germanic museum at Nuremberg, a statue of the Blessed Virgin in the Frauenkirche, the Annunciation in the Lorenzkirche and the circular rosary in the Germanic museum.

STOTHARD, CHARLES ALFRED (1786–1821), antiquarian draughtsman, son of Thomas Stothard (*q.v.*), was born in London on the 5th of July 1786. After studying in the schools of the Royal Academy, he began, in 1810, his first historical piece, the Death of Richard II. in Pomfret Castle. He published in 1811 the first part of his valuable work, *The Monumental Effigies of Great Britain*. He was appointed historical draughtsman to the Society of Antiquaries, and was deputed by that body to visit Bayeux to make drawings of the tapestry. He was made a fellow of the society in 1819, and subsequently engaged in numerous journeys with the view of illustrating the works of D. Lysons. While engaged in tracing a portrait from one of the windows of the church of Beer Ferrers, Devonshire, he fell and was killed on the spot (May 27, 1821). His widow (afterwards Mrs Bray), with her brother, completed his *Monumental Effigies*, left unfinished at his death.

A biography, by his widow, was published in 1823.

STOTHARD, THOMAS (1755–1834), English subject painter, was born in London on the 17th of August 1755, the son of a well-to-do innkeeper in Long Acre. Being a delicate child, he was sent at the age of five to a relative in Yorkshire, and attended school at Acomb, and afterwards at Tadcaster and at Ilford in Essex. Showing a turn for drawing he was apprenticed to a draughtsman of patterns for brocaded silks in Spitalfields, and during his leisure hours he attempted illustrations to the works of his favourite poets. Some of these drawings were praised by Harrison, the editor of the *Novelist's Magazine*, and, Stothard's master having died, he resolved to devote himself to art.

In 1778 he became a student of the Royal Academy, of which he was elected associate in 1792 and full academician in 1794. In 1812 he was appointed librarian, having served as assistant for two years. He died in London on the 27th of April 1834.

Among his earliest book illustrations are plates engraved for *Ossian* and for *Bell's Poets*; and in 1780 he became a regular contributor to the *Novelist's Magazine*, for which he executed one hundred and forty-eight designs, including his eleven admirable illustrations to *Peregrine Pickle* and his graceful subjects from *Clarissa* and *Sir Charles Grandison*. He contentedly designed plates for pocket-books, tickets for concerts, illustrations to almanacs, portraits of popular players—and into even the slightest and most trivial sketches he infused a grace and distinction which render them of value to the collectors of the present time. Among his more important series are the two sets of illustrations to *Robinson Crusoe*, one for the *New Magazine* and one for Stockdale's edition, and the plates to *The Pilgrim's Progress* (1788), to Harding's edition of Goldsmith's *Vicar of Wakefield* (1792), to *The Rape of the Lock* (1798), to the works of Gessner (1802), to Cowper's *Poems* (1825), and to *The Decameron*; while his figure-subjects in the superb editions of Roger's *Italy* (1830) and *Poems* (1834) prove that even in latest age his fancy was still unexhausted, and his hand hardly at all enfeebled. He is at his best in subjects of a domestic or a gracefully ideal sort; the heroic and the tragic were beyond his powers. The designs by Stothard were estimated by R. N. Wornum to number five thousand, and of these about three thousand have been engraved. His oil pictures are usually small in size, and rather sketchy in handling. Their colouring is often rich and glowing, being founded upon the practice of Rubens, of whom Stothard was a great admirer. The "Vintage," perhaps his most important oil painting, is in the National Gallery. He was a contributor to Boydell's Shakespeare Gallery, but his best-known painting is the "Procession of the Canterbury Pilgrims," also in the National Gallery, the engraving from which, begun by Luigi and continued by Niccolo Schiavonetti and finished by James Heath, attained an immense popularity. The commission for this picture was given to Stothard by R. H. Cromek, and was the cause of a quarrel with his friend William Blake. It was followed by a companion work, the "Flitch of Bacon," which was drawn in sepia for the engraver but was never carried out in colour.

In addition to his easel pictures, Stothard adorned the grand staircase of Burghley House, near Stamford, with subjects of War, Intemperance, and the Descent of Orpheus in Hell (1799–1803); the mansion of Hafod, North Wales, with a series of scenes from Froissart and Monstrelet (1810); the cupola of the upper hall of the Advocates' Library, Edinburgh (now occupied by the Signet Library), with Apollo and the Muses, and figures of poets, orators, &c. (1822); and he prepared designs for a frieze and other decorations for Buckingham Palace, which were not executed, owing to the death of George IV. He also designed the magnificent shield presented to the duke of Wellington by the merchants of London, and executed with his own hand a series of eight etchings from the various subjects which adorned it. In the British Museum is a collection, in four volumes, of engravings of Stothard's works, made by Robert Balmanno.

An interesting but most indiscriminately eulogistic biography of Stothard, by his daughter-in-law, Mrs Bray, was published in 1851. A. C. Coxhead's *Thomas Stothard, R.A., an Illustrated Monograph* (1906), contains a short biographical chapter, and an accurately dated summary of the various books and periodicals illustrated by Stothard; see also Austin Dobson, *Eighteenth Century Vignettes*, 1st series (1892).

STOUGHTON, JOHN (1807–1897), English Nonconformist divine, was born at Norwich on the 18th of November 1807. His father was an Episcopalian, his mother a member of the Society of Friends. Stoughton was educated at Norwich Grammar School, and, after an interval of legal study, at Highbury Congregational College. In 1833 he became minister at Windsor, in 1843 at Kensington; in 1856 he was elected chairman of the Congregational Union. From 1872 to 1884 he was professor of historical theology in New College, Hampstead. He died at Ealing on the 24th of October 1897. Stoughton was no controversialist, but did a good deal of sound historical work which was published in *Church and State 1660–1663* (London, 1862); *Ecclesiastical History of England 1640–1660* (4 vols., London, 1867–1870); *Religion in England under Queen Anne and the Georges* (2 vols., 1878); *Religion in England from 1800 to 1880* (2 vols., 1884). He contributed an account of Nonconformist modes of celebrating the Lord's Supper to the ritual commission of 1870, arranged a conference on co-operation between Anglicans and dissenters (presided over by Archbishop Tait) in 1876, was one of Dean Stanley's lecturers in Westminster Abbey and a pall-bearer at his funeral. He was elected to the Athenaeum Club in 1874 on the nomination of Matthew Arnold.

Besides the books already mentioned he wrote a number of more popular works, among which *Homes and Haunts of Luther* (1875), *The Italian Reformers* (1881), and *The Spanish Reformers* (1883) are conspicuous. His *Recollections of a Long Life* (1894) furnish interesting autobiographical material.

STOUR, the name of several English rivers. (1) The East-Anglian Stour rises in the slight chalk hills in the south-east of Cambridgeshire and follows a course ranging from east to south-east to the North Sea at Harwich, passing Clare, Sudbury, Nayland and Manningtree. It falls about 380 ft. in a course of 60 m., and drains an area of 407 sq. m. Over nearly its entire course it forms the boundary between Suffolk and Essex. From Manningtree downward its course is estuarine, and it is joined immediately above Harwich by the estuary of the Orwell. It is navigable up to Sudbury but does not bear much traffic. (2) The Kentish Stour or Great Stour rises on the southern face of the North Downs, the branch called the East Stour having its source not far inland from Hythe, but flowing at first away from the sea, while the main or western branch rises near Lenham. They unite at Ashford. Passing Canterbury, the Stour divides into two branches, the larger reaching the English Channel in Pegwell Bay, while the smaller runs north to the North Sea at Reculver. The larger branch is joined in the levels by the Little Stour from the south. The Stour is navigable to Fordwich near Canterbury, but is little used above Sandwich. Its length is about 40 m., its fall from Ashford 150 ft., and its drainage area 370 sq. m. The name of Stour belongs also to (3) a considerable but unnavigable tributary of the Hampshire Avon, rising in Wiltshire, and touching Somersetshire and Dorsetshire before it joins the main river in Hampshire close to its mouth; (4) a left bank tributary of the Severn, which it joins at Stourport, its course being followed by the Worcestershire and Staffordshire canal; and (5) a small tributary of the upper Avon, rising in the north of Oxfordshire in the hills west of Banbury, and joining the main river a little below Stratford-on-Avon.

STOURBRIDGE, a market town in the Droitwich parliamentary division of Worcestershire, England, 144 m. N.W. by W. of London and 10 W. of Birmingham by the Great Western railway. Pop. of urban district (1901), 16,302. A branch canal connects with the Worcestershire and Staffordshire system. The town stands on an eminence on the left bank of the Stour. Among public buildings are a town-hall (1887) and town offices, and a school of science and art. There is an endowed grammar school founded by Edward VI., and a bluecoat or hospital school. Dr Johnson received part of his education in this town (1726–1727). The principal manufactures are in iron, leather and skins; there are glue works and fire-brick works. Coal and fire-clay are raised. The manufacture of glass was established in 1556 by emigrants from Hungary, the place where they erected their factory being still known as Hungary Hill. Annual fairs are held. The town was originally called Bedcote, a name retained by the manor. The urban district includes the townships of Upper Swinford and Wollaston.

STOURPORT, a market town in the Bewdley parliamentary division of Worcestershire, England, $14\frac{1}{2}$ m. N. by W. of Worcester by the Great Western railway. Pop. of urban district

(1901), 4529. It lies on the left bank of the Severn, at the junction of the Stour and the Staffordshire and Worcestershire canal. The town grew up after the opening of the canal in 1768. Ironworks, carpet-weaving and tanneries occupy many hands. At Redstone, the site of a former important ferry over the Severn, is a curious hermitage, excavated out of the red sandstone bank.

STOVE, an apparatus for heating a room, building, greenhouse or hothouse, or for cooking. It is essentially closed or partially closed, as distinct from the open grate or fireplace, and consists of a receiver in which the fuel is burned, of cast or sheet-iron, tiles cemented together and backed or even of solid masonry. Stoves may be classified according to the fuel burned (see HEATING). The word was originally of wider meaning and was used of a heated room, house or chamber, thus the O. Eng. *stofa* glosses *balneum*, and mod. Ger. *Stube* and Dan. *stue* mean merely a room, O. H. Ger. *Stubā*, *Stupa* being used of a heated bathroom; early Du. *stove* also was used in this wider sense, the later form *stoof* is used as in modern English, and this may be the immediate source of the present meaning, the early word having been lost. Romanic languages borrowed it, *e.g.* Ital. *stufa*, Fr. *étuve*, O. Fr. *estuve*, whence was adapted Eng. " stew," properly a bath or hothouse, used chiefly in plural " stews," a brothel, and " to stew," originally to bathe, then to boil slowly, and as a noun, a mess of stewed meat. " Stew," a fish-pond, is a Low German word *stouwe*, dam, weir, fish-pond, from *stouwen*, to dam up, cf. Ger. *stauen*, Eng. stow.

STOW, JOHN (*c.* 1525–1605), English historian and antiquary, was the son of Thomas Stow, a tailor, and was born about 1525 in London, in the parish of St Michael, Cornhill. His parents were poor, for his father's whole rent for his house and garden was only 6s. 6d. a year, and Stow himself in his youth fetched every morning the milk for the family from a farm belonging to the nunnery of the Minories. He learned the trade of his father, but possibly did not practise it much after he grew up. In 1549 he " kept house " near the well within Aldgate, but afterwards he removed to Lime Street ward, where he resided till his death. About 1560 he entered upon the work with which his name is associated. He made the acquaintance of the leading antiquaries of his time, including William Camden, and in 1561 he published his first work, *The woorkes of Geffrey Chaucer, newly printed with divers addicions whiche were never in printe before.* This was followed in 1565 by his *Summarie of Englyshe Chronicles*, which was frequently reprinted, with slight variations, during his lifetime. Of the first edition a copy was said to have been at one time in the Grenville library. In the British Museum there are copies of the editions of 1567, 1573, 1590, 1598 and 1604. Stow having in his dedication to the edition of 1567 referred to the rival publication of Richard Grafton (*c.* 1500–*c.* 1572) in contemptuous terms, the dispute between them became extremely embittered. Stow's antiquarian tastes brought him under ecclesiastical suspicion as a person " with many dangerous and superstitious books in his possession," and in 1568 his house was searched. An inventory was taken of certain books he possessed " in defence of papistry," but he was apparently able to satisfy his interrogators of the soundness of his Protestantism. A second attempt to incriminate him in 1570 was also without result. In 1580 Stow published his *Annales, or a Generale Chronicle of England from Brute until the present yeare of Christ 1580*; it was reprinted in 1592, 1601 and 1605, the last being continued to the 26th of March 1605, or within ten days of his death; editions " amended " by Edmund Howes appeared in 1615 and 1631.

The work by which Stow is best known is his *Survey of London*, published in 1598, not only interesting from the quaint simplicity of its style and its amusing descriptions and anecdotes, but of unique value from its minute account of the buildings, social condition and customs of London in the time of Elizabeth. A second edition appeared in his lifetime in 1603, a third with additions by Anthony Munday in 1618, a fourth by Munday and Dyson in 1633, a fifth with interpolated amendments by John Strype in 1720, and a sixth by the same editor in 1754. The edition of 1598 was reprinted, edited by W. J. Thoms, in 1842, in 1846, and with illustrations in 1876. Through the patronage of Archbishop Parker, Stow was enabled to print the *Flores historiarum* of Matthew of Westminster in 1567, the *Chronicle* of Matthew Paris in 1571, and the *Historia brevis* of Thomas Walsingham in 1574. At the request of Parker he had himself compiled a " farre larger volume," *An history of this island*, but circumstances were unfavourable to its publication and the manuscript is now lost. Additions to the previously published works of Chaucer were twice made through Stow's " own painful labours " in the edition of 1561, referred to above, and also in 1597. A number of Stow's manuscripts are in the Harleian collection in the British Museum. Some are in the Lambeth library (No. 306); and from the volume which includes them were published by the Camden Society, edited by James Gairdner, *Three Fifteenth-Century Chronicles, with Historical Memoranda by John Stowe the Antiquary, and Contemporary Notes of Occurrences written by him* (1880). Stow's literary labours did not prove very remunerative, but he accepted poverty in a cheerful spirit. Ben Jonson relates that once when walking with him Stow jocularly asked two mendicant cripples " what they would have to take him to their order." In March 1604 James I. authorized him and his deputies to collect " amongst our loving subjects their voluntary contributions and kind gratuities," and himself began " the largesse for the example of others." If the royal appeal was successful Stow did not live long to enjoy the increased comfort resulting from it, as he died on the 6th of April 1605. He was buried in the London church of St Andrew Undershaft, where the monument erected by his widow, exhibiting a terra-cotta figure of him, still remains.

Stow's *Survey of London* has been edited with notes by C. L. Kingsford (Oxford, 1908).

STOWE, HARRIET ELIZABETH [BEECHER] (1811–1896), American writer and philanthropist, seventh child of Lyman and Roxana (Foote) Beecher, was born at Litchfield, Connecticut, U.S.A., on the 14th of June 1811. Her father (the Congregational minister of the town) and her mother were both descended from members of the company that, under John Davenport, founded New Haven in 1638; and the community in which she spent her childhood was one of the most intellectual in New England. At her mother's death in 1815 she came most directly under the influence of her eldest sister Catherine, eleven years her senior, a woman of keen intellect, who a few years later set up a school in Hartford to which Harriet went, first as a pupil, afterwards as teacher. In 1832 her father, who had for six years been the pastor of a church in Boston, accepted the presidency of the newly founded Lane Theological Seminary at Cincinnati. Catherine Beecher, who was eager to establish what should be in effect a pioneer college for women, accompanied him; and with her went Harriet as an assistant, taking an active part in the literary and school life, contributing stories and sketches to local journals and compiling a school geography. She was married on the 6th of January 1836 to one of the professors in the seminary, Calvin Ellis Stowe. In the midst of privation and anxiety, due largely to her husband's precarious health, she wrote continually, and in 1843 published *The Mayflower*, a collection of tales and sketches. Mrs Stowe passed eighteen years in Cincinnati under conditions which constantly thrust the problem of human slavery upon her attention. A river only separated Ohio from a slave-holding community. Slaves were continually escaping from their masters, and were harboured, on their way to Canada, by the circle in which Mrs Stowe lived. In the practical questions which arose, and in the great debate which was political, economical and moral, she took a very active part. When, therefore, in 1850, Mr Stowe was elected to a professorship in Bowdoin College, Brunswick, Maine, and removed his family thither, Mrs Stowe was prepared for the great work which came to her, bit by bit, as a religious message which she must deliver. In the quiet of a country town, far removed from actual contact with painful scenes, but on the edge of the whirlwind raised by the Fugitive Slave Bill, memory and imagination had full scope, and she wrote for serial publication in *The National Era*, an anti-slavery paper of Washington, D.C., the story of "Uncle Tom's Cabin; or, Life among the Lowly." The publication in book form (March 20, 1852) was a factor which must be reckoned in summing up the moving causes of the war for the Union. The book sprang into unexampled popularity, and was translated into at least twenty-three tongues. Mrs Stowe used the reputation thus won in promoting a moral and religious enmity to slavery. She reinforced her story with *A Key to Uncle Tom's Cabin*, in which she accumulated a large number of documents and testimonies against the great evil; and in 1853 she made a journey to Europe, devoting herself especially to creating an *entente cordiale* between Englishwomen and Americans on the question of the day. In 1856 she published *Dred; a Tale of the Dismal Swamp*, in which she threw the weight of her argument on the deterioration of a society resting on a slave basis. The establishment of *The Atlantic Monthly* in 1857 gave her a constant vehicle for her writings, as did also *The Independent* of New York, and later *The Christian Union*, of each of which papers successively her brother, Henry Ward Beecher, was one of the editors. From this time forth she led the life of a woman of letters, writing novels, of which *The Minister's Wooing* (1859) is best known, and many studies of social life in the form both of fiction and essay. She published also a small volume of religious poems, and towards the end of her career gave some public readings from her writings. In 1852 Professor Stowe accepted a professorship in the Theological Seminary at Andover, Massachusetts, and the family made its home there till 1863, when he retired wholly from professional life and removed to Hartford. After the close of the war for the Union Mrs Stowe bought an estate in Florida, chiefly in hope of restoring the health of her son, Captain Frederick Beecher Stowe, who had been wounded in the war, and in this southern home she spent many winters. After the death of her husband in 1886 she passed the rest of her life in the seclusion of her Hartford home, where she died on the 1st of July 1896. She is buried by the side of her husband at Andover.

See *Life of Harriet Beecher Stowe*, compiled from her letters and journals by her son, Charles Edward Stowe (Boston, 1890). *Life and Letters of Harriet Beecher Stowe*, edited by Annie Fields (Boston, 1898). (H. E. S.*)

STOWELL, WILLIAM SCOTT, BARON (1745–1836), English judge and jurist, was born at Heworth, a village about 4 m. from Newcastle, on the 17th of October 1745, the son of a "coalfitter" (or tradesman engaged in the transport of coal). His younger brother John became the famous Lord Chancellor Eldon. Scott was educated at the Newcastle grammar school and Corpus Christi College, Oxford, where he gained a Durham scholarship in 1761. In 1764 he graduated and became first a probationary fellow and then—as successor to William (afterwards the well-known Sir William) Jones—a tutor of University college. As Camden reader of ancient history (1774) he rivalled the reputation of Blackstone. Although he had joined the Middle Temple in 1762, it was not till 1776 that Scott devoted himself to a systematic study of law. In 1779 he graduated as doctor of civil law, and, after the customary "year of silence," commenced practice in the ecclesiastical courts. His professional success was rapid. In 1783 he became registrar of the court of faculties, and in 1788 judge of the consistory court and advocate-general, in that year too receiving the honour of knighthood; and in 1798 he was made judge of the high court of admiralty. Sir William Scott twice contested the representation of Oxford University—in 1780 without success, but successfully in 1801. He also sat for Downton in 1790. Upon the coronation of George IV. (1821) he was raised to the peerage as Baron Stowell. After a life of distinguished judicial service Lord Stowell retired from the bench—from the consistory court in August 1821, and from the high court of admiralty in December 1827. His mental faculties became gradually feebler in his old age, and he died on the 28th of January 1836. Lord Stowell was twice married—in 1781 to Anna Maria, eldest daughter and heiress of John Bagnall of Early Court, Berks., by whom he had four children, one of these, a daughter, survived him; and in 1813 to the dowager marchioness of Sligo.

Lord Stowell's judgments are models alike of literary execution and of judicial reasoning. His style is chaste yet not inornate, nervous without abruptness, and perfectly adjusted in every instance to the subject with which he deals. His decisions in the cases of *Dalyrmple* v. *Dalyrmple* (Dr Dodson's *Report*) and *Evans* v. *Evans* (1 Hagg. 35)—from their combined force and grace, from the steadiness with which every collateral issue is set aside, from their subtle insight into human motives and from the light which they cast on marriage law—deserve and will repay attentive perusal. Lord Stowell composed with great care, and some of the MSS. which he revised for Haggard and Phillimore's *Reports* were full of interlineations. Stowell's mind was judicial rather than forensic—reasoning, not as for a dialectic victory nor so as to convince the parties on whose suit he was deciding, but only with sufficient clearness, fulness and force to justify the decision at which he had arrived.

The chief doctrines of international law with the assertion and illustration of which the name of Lord Stowell is identified are these: the perfect equality and entire independence of all states ("*Le Louis*," 2 Dod. 243)—a logical deduction from the Austinian philosophy and still one of the fundamental principles of English jurisprudence; that the elementary rules of international law bind even semi-barbarous states (the "*Hurtige Hane*," 2 Rob. 325); that blockade to be binding must be effectual (the "*Betsey*," 1 Rob. 93); and that contraband of war is to be determined by "probable destination" (the "*Jonge Margaretha*," 1 Rob. 189). In the famous Swedish convoy case (the "*Maria*," 1 Rob. 350; see, too, the "*Recovery*," 6 C. Rob. 348–9) Lord Stowell asserted that "a prize court is a court not merely of the country in which it sits but of the law of nations." "The seat of judicial authority," he added, in words which have become classic, "is indeed locally here, in the belligerent country, but the law itself has no locality." His dictum concerning the right of a belligerent to sink a neutral ship, when unable to take her before a prize court, was much quoted in 1904 in reference to the sinking of the "Knight Commander" by the Russians in the Far East.

The judgments of Lord Stowell were, almost without exception, confirmed on appeal, and they are to this day the international law of England, and have become presumptive though not conclusive evidence of the international law of America. "I have taken care," wrote Justice Story, "that they shall form the basis of the maritime law of the United States, and I have no hesitation in saying that they ought to do so in that of every civilized country in the world."

Surtees, *Sketch of Lords Stowell and Eldon*; Creasy, *First Platform of International Law*; *Reports of Prize Cases from 1745 to 1859*, ed. E. S. Roscoe (2 vols. 1905; contains all the more important of Lord Stowell's judgments).

STOWMARKET, a market town in the Stowmarket parliamentary division of Suffolk, England; 12 m. N.N.W. of Ipswich by the Great Eastern railway, on the river Gipping. Pop. of urban district (1901), 4162. The church of St Peter and St Mary is Decorated and Early English, with a lofty tower and wooden spire. The ancient vicarage has associations with Milton through his tutor, Dr Young. The town has an extensive chemical manufactory, iron foundry, and factories for the manufacture of guncotton, agricultural implements and compressed leather. There is also considerable trade in corn, malt, coal, slate and timber.

STRABANE, a market town and the principal town of Co. Tyrone, Ireland. Pop. (1901), 5033. It stands at the junction of the rivers Mourne and Finn, which thenceforward form the Foyle. It is 161¼ m. N.W. by N. from Dublin by the Great Northern railway, and has also a station on the Donegal railway, the two companies using separate lines to Londonderry. Lifford, across the river, practically a suburb of Strabane, is the county town of Co. Donegal. A short canal connects the town with the point at which the Foyle becomes navigable. The trade in corn is considerable. Linen and shirt making, and iron and brass founding, are prosecuted. A castle of the time of James I. has left no remains. The town is governed by an urban district council. It returned two members to the Irish parliament until the Union in 1800.

STRABO (born *c.* 63 B.C.), Greek geographer and historian, was born at Amasia in Pontus, a city which had been much Hellenized, and was the royal residence of the kings of Pontus. We know nothing of his father's family, but several of his mother's relatives held important posts under Mithradates V. and VI. Some were of Hellenic, others of Asiatic origin, but Strabo himself was by language and education thoroughly Greek. The date of his birth cannot be exactly determined, but from various indications in his work it seems to have been about 63 B.C. He studied at Nysa under the grammarian Aristodemus, under Tyrannio the grammarian at Rome, under the philosopher Xenarchus either at Rome or at Alexandria, and he had studied Aristotle along with Boethus (possibly at Rome under Tyrannio, who had access to the Aristotelian writings in Sulla's library). He states that he saw P. Servilius Isauricus, who died at Rome in advanced years in 44 B.C., from which it has been inferred that he visited Rome early in life. He also tells us that he was at Gyaros (one of the Cyclades) when Augustus was at Corinth on his return to Rome from the East in 29 B.C., and that he accompanied the prefect of Egypt, Aelius Gallus, on his expedition to Upper Egypt, which seems to have taken place in 25–24 B.C. These are the only dates in his life which can be accurately fixed. The latest event mentioned in his work is the death of Juba, king of Mauretania, which took place in A.D. 21.

Although he had seen a comparatively small portion of the regions which he describes, he had travelled much. As he states himself: "Westward I have journeyed to the parts of Etruria opposite Sardinia; towards the south from the Euxine to the borders of Ethiopia; and perhaps not one of those who have written geographies has visited more places than I have between those limits." He tells us that he had seen Egypt as far south as Syene and Philae, Comana in Cappadocia, Ephesus, Mylasa, Nysa and Hierapolis in Phrygia, Gyarus and Populonia. Of Greece proper he saw but little; it is by no means certain that he even visited Athens, and though he describes Corinth as an eye-witness, it is clear that he was never at Delphi, and was not aware that the ruins of Mycenae still existed. He had seen Cyrene from the sea, probably on his voyage from Puteoli to Alexandria, where he remained a long time, probably amassing materials, and studying astronomy and mathematics. For nowhere could he have had a better means of consulting the works of historians, geographers and astronomers, such as Eratosthenes, Posidonius, Hipparchus and Apollodorus. We cannot tell where his *Geography* was written, but it was at least finally revised between A.D. 17 and 23, since we have historical allusions which can be dated to that time. Probably Strabo was then in Rome; the fact that his work passed unnoticed by Roman writers such as the elder Pliny does not prove the contrary.

Works.—His earliest writing was an historical work now lost, which he himself describes as his *Historical Memoirs.* He tells us (xi. 9, 3) that the sixth book of the *Memoirs* was identical with the second of the *Continuation of Polybius*; probably, therefore, books i.–iv. formed an introduction to the main work. This accounts for the fact that he speaks (ii. 70) of having treated of the exploits of Alexander in his *Memoirs*, a topic which could not have found a place in a work which began where that of Polybius ended (146 B.C.). According to Suïdas, the continuation of Polybius was in forty-three books. Plutarch, who calls him "the Philosopher," quotes Strabo's *Memoirs* (*Luc.* 28), and cites him as an historian (*Sulla*, 26). Josephus, who constantly calls him "the Cappadocian," often quotes from him, but does not mention the title of the work.

The *Geography* is the most important work on that science which antiquity has left us. It was, as far as we know, the first attempt to collect all the geographical knowledge at the time attainable, and to compose a general treatise on geography. It is not merely a new edition of Eratosthenes. In general outline it follows necessarily the work of the last-named geographer, who had first laid down a scientific basis for geography. Strabo made considerable alterations, but not always for the better. The three books of the older work formed a strictly technical geographical treatise. Its small size prevented it from containing any such general description of separate countries as Strabo rightly conceived to fall within the scope of the geographer. "Strabo indeed appears to be the first who conceived a complete geographical treatise as comprising the four divisions of mathematical, physical, political and historical geography, and he endeavoured, however imperfectly, to keep all these objects in view." The incidental historical notices, which are often of great value and interest, are all his own. These digressions at times interrupt the symmetry of his plan; but Strabo had all the Greek love of legendary lore, and he discusses the journeyings of Heracles as earnestly as if they were events within recent history. He regarded Homer as the source of all wisdom and knowledge—indeed, his description of Greece is largely drawn from Apollodorus's commentary on the Homeric "Catalogue of Ships"—and treated Herodotus with undeserved contempt. classing him with Ctesias and other "marvel-mongers." Yet in some respects Herodotus had better information (*e.g.* in regard to the Caspian) than Strabo himself. Again, Strabo may be censured for discarding the statements of Pytheas respecting the west and north of Europe, accepted as they had been by Eratosthenes. But in this he relied on Polybius, whom he might justly consider as having from his position at Rome far better means of gaining accurate information. It must be admitted that the statements of Pytheas did not accord with the theory of Strabo just in those very points where he was at variance with Eratosthenes. He showed likewise an unwarranted scepticism in reference to the island of Cerne on the west coast of Africa, which without doubt the Carthaginians had long used as an emporium.

Strabo chiefly employed Greek authorities (the Alexandrian geographers Polybius, Posidonius and Theophanes of Mytilene, the companion of Pompey) and made comparatively little use of Roman authorities. Although he refers to Caesar's *Commentaries* once by name, and evidently made use of them in other passages, he but imperfectly availed himself of that work. He designed his geography as a sequel to his historical writings, and it had as it were grown out of his historical materials, which were chiefly Greek. Moreover Strabo probably amassed his material in the library of Alexandria, so that Greek authorities would naturally furnish the great bulk of his collections. Doubtless, however, he returned to Rome after a long sojourn in Alexandria, a fact which explains the defectiveness of his information about the countries to the east of his native land, and renders it possible for him to have made use of the "chorography" of Agrippa, a map of the Roman Empire and adjacent countries set up by order of Augustus in the Porticus Vipsaniae.

He designed the work for the statesman rather than for the student. He therefore endeavours to give a general sketch of the character, physical peculiarities and natural productions of each country, and consequently gives us much valuable information respecting ethnology, trade and metallurgy. It was almost necessary that he should select what he thought most important for description, and at times omit what we deem of more importance. With respect to physical geography, his work is a great advance on all preceding ones. Judged by modern standards, his description of the direction of rivers and mountain-chains seems defective, but allowance must be made for difficulties in procuring information, and for want of accurate instruments. In respect of mathematical geography, his lack of scientific training was no great hindrance. He had before him the results of Eratosthenes, Hipparchus and Posidonius. The chief conclusions of astronomers concerning the spherical figure and dimensions of the earth, its relation to the heavenly bodies, and the great circles of the globe—the equator, the ecliptic and the tropics—were considered as well established. He accepted also the division into five zones; he quotes approvingly the assertion of Hipparchus that it was impossible to make real advances in geography without astronomical observations for determining latitudes and longitudes.

The work consists of seventeen books, of which the seventh is imperfect. The first two are introductory, the next eight deal with Europe (two being devoted to Spain and Gaul, two to Italy and Sicily, one to the north and east of Europe, and three to Greek lands). The eleventh book treats of the main divisions of Asia and the more easterly districts, the next three of Asia Minor. Book xv. deals with India and Persia, book xvi. with Assyria, Babylonia, Syria and Arabia, and the closing book with Egypt and Africa.

Editions.—The Aldine (Venice, 1516) was unfortunately based on a very corrupt MS. The first substantial improvements in the text were due to Casaubon (Geneva, 1587; Paris, 1620), whose text remained the basis of subsequent editions till that of Coraës (Paris, 1815–1819), who removed many corruptions. The MSS. were first scientifically collated by Kramer (Berlin, 1844–1852), who demonstrated that Par. 1397 was the best authority for the first nine books (it contains no more) and Vat. 1329 for the remainder. Of later editions the most important are those of C. Müller (Paris, 1853) and Meineke (Leipzig, 1866–1877). H. F. Tozer's volume of selections (Oxford, 1893) is useful. Napoleon I., an admirer of Strabo, caused a French translation of the *Geography* to be made by Coraës, Letronne and others (Paris 1805–1819); Grosskurd's German translation (Berlin, 1831–1834), with notes, is a monumental work. The fragments of the *Historical Memoirs* have been edited by P. Otto (*Leipziger Studien XI*, 1891); see also Müller's *Fragmenta historicorum graecorum*, iii. 490 sqq. Bunbury's *History of Ancient Geography*, vol. ii. chs. 21, 22; and F. Dubois's *Examen de la géographie de Strabon* (Paris, 1891) should also be consulted. (H. S. J.)

STRACHAN, JOHN (1778–1867), first bishop of Toronto, son of John Strachan and Elizabeth Finlayson his wife, was born at Aberdeen, Scotland, on the 12th of April 1778. His father died in 1792 from an accident in the granite quarries of which he was an overseer. Thus from an early age young Strachan had to depend upon his own resources and even to assist his mother, whom he loyally aided till her death in 1812. He managed, by undertaking private teaching and with the aid of a bursary, to go to the university of Aberdeen, where he took his M.A. degree. He attended some of the divinity classes at the university, where also he formed a lasting friendship with two of his fellow students, well known afterwards as Professor Duncan and Dr Chalmers. In 1799 he emigrated to Canada, having been recommended to the Hon. Richard Cartwright, of Kingston, Upper Canada, as suitable for tutorial work. Strachan went to Canada a Presbyterian. His associations there, however, were almost exclusively with Episcopalians, including Mr Cartwright and the Rev. Dr. Stuart, for a time the only clergyman in the district. Moreover, special provision had been made in the Constitutional Act of 1791 for the liberal endowment of the Protestant religion, then identified in the official mind with the Church of England, through what were afterwards known as the Clergy Reserves, being one-seventh of the lands of the new townships opened for settlement. Having decided to enter the Episcopal Church, Strachan was ordained on the 22nd of May 1803, and was immediately afterwards appointed to the parish of Cornwall. Thither he removed his school, which soon became the most noted educational institution in the country. There many future leaders of public and professional life in Canada came under the influence of Strachan's vigorous personality. In 1807 he married the youthful widow of Andrew McGill, a wealthy merchant of Montreal, and brother of the founder of McGill University. In 1811 he received the honorary degree of D.D. from his alma mater, Aberdeen University. During the same year Dr Stuart of Kingston died and was succeeded by his son George O'Kill Stuart, incumbent at York, the capital of the province. Through the influence of Lieut.-Governor Gore, supplemented by that of Sir Isaac Brock, Strachan was prevailed upon in 1812 to transfer himself to York, where he was soon deeply involved in civil and ecclesiastical politics.

During the War of 1812 he was of special service to the executive government and the citizens of the town when the American troops captured York and burned the public buildings. He was chiefly instrumental also in founding the Loyal and Patriotic Society of Upper Canada, which raised funds for the relief of the wounded and the assistance of the widows and orphans of the slain. On the urgent recommendation of Lieut.-Governor Gore he was appointed to the executive council of Upper Canada in 1815. A man of great force of character and much ability, of keen ambitions and unusual shrewdness, though not remarkable for breadth of mind, he attained to great influence in the executive government and was soon the leading spirit in that dominant group known in Upper Canadian history as the Family Compact. In 1820 he was appointed by Sir Peregrine Maitland a member of the legislative council in order that the governor might have a confidential medium through whom to make communication to the council. At the instance of the lieutenant-governor he went to England in 1824, to discuss various colonial questions with the earl of Bathurst, then colonial secretary. Strachan had no difficulty in convincing Lord Bathurst of the justice of his claims on all essential matters, the most important of which was the exclusive right of the Church of England in Canada to the Clergy Reserves. Though in favour of selling a portion of these lands to provide a fund for the existing needs of the Church, he secured the defeat of the proposal then before the government to dispose of the Clergy Reserves to the Canada Company. He took much interest in the educational affairs of the province, and in 1807 was instrumental in having provision made for the establishment of the first grammar schools. In 1824 he secured the passing of an act providing assistance for the public schools of each district. During his second visit to England in 1826–1827 he obtained a royal charter for the university of King's College, with provision for its endowment out of the crown lands. It was, however, to be entirely under the control of the Church of England. In 1827 Strachan became archdeacon of York.

The break-up of the Liverpool ministry in 1827 interrupted the successful development of Strachan's plans for placing virtually the whole of the government endowments for religion and education under the control of the Episcopal Church. The storm of protest of the other religious denominations caused the colonial office to undertake an investigation of the whole question, the result of which was presented in the report of 1828. After a long silence in the face of severe and persistent criticism, Strachan made a general reply in a very able speech in the legislative council in March 1828. When the storm had subsided the Clergy Reserves and university questions remained dormant until 1836, when the attempt to apply the Reserves to the endowment of rectories renewed the trouble and contributed largely to the crisis of 1837. Adverse criticism and a suggestion from the colonial office that he should cease from active participation in political affairs led to his resignation from the executive council, but he declined to give up his seat in the legislative council.

On the death of Bishop Stewart of Quebec the Canadian see was divided, and Strachan was made bishop of Toronto in August 1839. He energetically opposed the act of 1840, which sought to settle the Clergy Reserves question by dividing the proceeds among the different religious denominations, the larger share still remaining with the Church of England.

The university of King's College was finally established, with certain modifications of its charter, in 1843, Bishop Strachan being the first president. The renewed agitation finally resulted in the elimination of all religious tests by the act of 1849, which also changed the name to that of the university of Toronto. Strachan at once took steps to found another university which should be completely under the control of the Episcopal Church, hence the establishment of Trinity University, which was opened in 1852. Bishop Strachan also raised once more the question of the disposal of the Clergy Reserves. After several strong appeals and counter-appeals to the British government, the Canadian parliament was allowed to deal as it pleased with the question, with the result that the Reserves were completely secularized in 1854, provision being made for the life-interest of the beneficiaries at the time. Bishop Strachan devoted the latter years of his long life entirely to his episcopal duties, and by introducing the diocesan synod he furnished the Episcopal Church in Canada with a more democratic organ of government. He died in November 1867.

STRACHEY, SIR JOHN (1823–1907), British Indian civilian, fifth son of Edward Strachey, was born in London on the 5th of June 1823. After passing through Haileybury, Strachey entered the Bengal civil service in 1842, and served in the North-Western Provinces, occupying many important positions. In 1861 Lord Canning appointed him president of a commission to investigate the great cholera epidemic of that year. In 1862 he became judicial commissioner in the Central Provinces. In 1864, after the report of the royal commission on the sanitary condition of the army, a permanent sanitary commission was established in India, with Strachey as president. In 1866 he became chief commissioner of Oudh, having been chosen by Lord Lawrence to remedy as far as possible the injustice done after the Mutiny by the confiscation of the rights of tenants and small proprietors of land, maintaining at the same time the privileges of the Talukdars of great landlords As member of the legislative council he introduced several bills for that purpose, which, with the full approval of the Talukdars, passed into law. In 1868 he became member of the governor-general's council, and on the assassination of Lord Mayo in 1872 he acted temporarily as viceroy. In 1874 he was appointed lieutenant-governor of the North-Western Provinces. In 1876, by request of Lord Lytton and the secretary of state, he consented to relinquish that office, and returned to the governor-general's council as financial minister, which post he retained until 1880. During this time, while Lord Lytton was viceroy, important reforms were carried out. The measures for decentralizing financial administration, initiated under Lord Mayo. were practically completed. The salt duties were reduced, and the system under which they were levied was altered, and that opprobrium of our administration, the inland customs line, was abolished. The removal of all import duties, including those on English cotton goods, and the establishment of complete free trade, was declared to be the fixed policy of the government, and this was in great measure carried into effect before 1880, when Strachey left India. The defective system on which the military accounts were kept occasioned a very erroneous estimate of the cost of the Afghan War of 1878–80. For this error Strachey was technically responsible, and it was made the occasion of a violent party attack which resulted in his resignation. The fact that almost the entire cost of the war was paid for out of revenue is a conclusive proof of the state of financial prosperity to which India attained as the result of his administration. From 1885 to 1895 Strachey was a member of the council of the secretary of state for India. He was joint author with Sir Richard Strachey of *The Finances and Public Works of India* (1882), besides writing *India* (3rd ed., 1903), and *Hastings and the Rohilla War* (1892). He died on the 19th of December 1907.

STRACHEY, SIR RICHARD (1817–1908), British soldier and Indian administrator, third son of Edward Strachey, was born on the 24th of July 1817, at Sutton Court, Somersetshire. From Addiscombe he passed into the Bengal Engineers in 1836, and was employed for some years on irrigation works in the North-Western Provinces. He served in the Sutlej campaign of 1845–46, and was at the battles of Aliwal and Sobraon, was mentioned in despatches, and received a brevet-majority. From 1858 to 1865 he was chiefly employed in the public works department, either as acting or permanent secretary to the government of India, and from 1867 to 1871 he filled the post of director-general of irrigation, then specially created. During this period the entire administration of public works was reorganized to adapt it to the increasing magnitude of the interests with which this department has had to deal since its establishment by Lord Dalhousie in 1854. For this reorganization, under which the accounts were placed on a proper footing and the forest administration greatly developed, Strachey was chiefly responsible. His work in connexion with Indian finance was important. In 1867 he prepared a scheme in considerable detail for decentralizing the financial administration of India, which formed the basis of the policy afterwards carried into effect by his brother Sir John Strachey under Lord Mayo and Lord Lytton. He left India in 1871, but in 1877 he was sent there to confer with the government on the purchase of the East Indian railway, and was then selected as president of the commission of inquiry into Indian famines. In 1878 he was appointed to act for six months as financial member of the governor-general's council, when he made proposals for meeting the difficulties arising from the depreciation of the rupee, then just beginning to be serious. These proposals did not meet with the support of the secretary of state. From that time he continued to take an active part in the efforts made to bring the currencies of India and England into harmony, until in 1892 he was appointed a member of Lord Herschell's committee, which arrived at conclusions in accordance with the views put forward by him in 1878. He attended in 1892 the International Monetary Conference at Brussels as delegate for British India. Strachey was a member of the council of the secretary of state for India from 1875 to 1889, when he resigned his seat in order to accept the post of chairman of the East Indian Railway Company. Strachey's scientific labours in connexion with the geology, botany and physical geography of the Himalaya were considerable. He devoted much time to meteorological research, was largely instrumental in the formation of the Indian meteorological department, and became chairman of the meteorological council of the Royal Society in 1883. From 1888 to 1890 he was president of the Royal Geographical Society. In 1897 he was awarded one of the royal medals of the Royal Society, of which he became a fellow in 1854; and in the same year he was created G.C.S.I. He died on the 12th of February 1908. His widow, Lady Strachey, whom he married in 1880, became well-known as an authoress and a supporter of women's suffrage.

STRACHWITZ, MORITZ KARL WILHELM ANTON, GRAF VON (1822–1847), German poet, was born on the 13th of March 1822 at Peterwitz near Frankenstein in Silesia. After studying in Breslau and Berlin he settled on his estate in Moravia, where he devoted himself to literary pursuits. When travelling in Italy in 1847 he was taken ill at Venice, and died on the 11th of December at Vienna. Although he had thus only reached his twenty-fifth year, he revealed a lyric genius of remarkable force and originality. His first collection of poems, *Lieder eines Erwachenden*, appeared in 1842 and went through several editions. *Neue Gedichte* were published after his death in 1848. These poems are characteristic of the transition through which the German lyric was passing between 1840 and 1848; the old Romantic strain is still dominant, especially in his ballads, which are unquestionably his finest productions; but, side by side with it, there is to be seen the influence of Platen, to whose warmest admirers Strachwitz belonged, as well as echoes of the restless political spirit of those eventful years. His political lyric was, however, tempered by an aristocratic restraint which was absent from the writings of men like Herwegh and Freiligrath. Strachwitz's early death was a great loss to German letters; for he was by far the most promising of the younger lyric poets of his time.

Strachwitz's collected *Gedichte* appeared first in 1850 (8th ed., 1891); a convenient reprint will be found in Reclam's *Universalbibliothek*. See A. K. T. Tielo, *Die Dichtung des Grafen Moritz von Strachwitz* (1902).

STRADELLA, ALESSANDRO (?1645–1682), Italian composer, was one of the most accomplished musicians of the 17th century. The hitherto generally accepted story of his life was first circumstantially narrated in Bonnet-Bourdelot's *Histoire de la musique et de ses effets* (Paris, 1715). According to this account, Stradella not only produced some successful operas at Venice, but also attained so great a reputation by the beauty of his voice that a Venetian nobleman engaged him to instruct his mistress, Ortensia, in singing. Stradella, the narrative goes on to say, shamefully betrayed his trust, and eloped with Ortensia to Rome, whither the outraged Venetian sent two paid *bravi* to put him to death. On their arrival in Rome the assassins learned that Stradella had just completed a new oratorio, over the performance of which he was to preside on the following day at S. Giovanni in Laterano. Taking advantage of this circumstance, they determined to kill him as he left the church; but the beauty of the music affected them so deeply that their hearts failed them at the critical moment, and, confessing their treachery, they entreated the composer to ensure his safety by quitting Rome immediately. Thereupon Stradella fled with Ortensia to Turin, where, notwithstanding the favour shown to him by the regent of Savoy, he was attacked one night by another band of assassins, who, headed by Ortensia's father, left him on the ramparts for dead. Through the connivance of the French ambassador the ruffians succeeded in making their escape; and in the meantime Stradella, recovering from his wounds, married Ortensia, by consent of the regent, and removed with her to Genoa. Here he believed himself safe; but a year later he and Ortensia were murdered in their house by a third party of assassins in the pay of the implacable Venetian.

Recent research has shown that Stradella was the son of a Cavaliere Marc' antonio Stradella of Piacenza, who in 1642–1643 was vice-marchese and governor of Vignola for Prince Boncompagni, who did not wish to live in the dominions from which he took the title of marchese di Vignola. He was deprived of his office in 1643 for having surrendered the castle to the papal troops, although it might have sustained a siege of several days and the help of the duke of Modena was expected. An elder brother of Alessandro, Francesco by name, became a member of the Augustinian order, and seems to have enjoyed the protection of the house of Este. Alessandro is supposed to have been born about 1645 or earlier, probably at Vignola, or Monfestino, a town on the road from Modena to Pistoja, to which his father retired after his dismissal; but no records of his birth have come to light in either of these places. The first certain date in his life is 1672, in which year he composed a prologue for the performance of Cesti's opera *La Dori* at Rome; and we may conclude that he spent a considerable time at Rome about this period, since his cantatas and other compositions contain frequent allusions to Rome and noble Roman families. There is, however, no proof that he ever performed the oratorio *S. Giovanni Battista* in the Lateran. Documents in the archives at Turin relate that in 1677 he arrived there with the mistress of Alvise Contarini, with whom he had eloped from Venice. Contarini demanded that both should be given up to him, or failing that, that Stradella should not be allowed to exercise his profession until the lady had been either placed in a convent or made his legitimate wife. Stradella was protected by the regent of Savoy, the duchess Giovanni Battista de Nemours, and the Contarini family, indignant at his audacity, sent two hired assassins to Turin, by whom Stradella was wounded but not murdered. We hear of Stradella last at Genoa. An opera by him, *La Forza dell' amor paterno*, was given there in 1678, and his last composition, *Il Barcheggio* (*i.e.* a "Water-Music"), was performed on the 16th of June 1681 in honour of the marriage of Carlo Spinola and Paola Brignole, which was solemnized on the 6th of July of the same year. Documents in the archives at Modena inform us that in February 1682 Stradella was murdered at Genoa by three brothers of the name of Lomellini, whose sister he had seduced.

It is extremely improbable that Stradella had any great reputation as a singer, since the great Italian singers of the 17th century were almost exclusively *castrati*; but he may well have been a teacher of singing, and he appears to have instructed his lady pupils in Genoa on the harpsichord. He is principally important as a composer of operas and chamber-cantatas, although compared with his contemporaries his output was small. In spite of his dissolute life his command of the technique of composition was remarkable, and his gift of melodic invention almost equal to that of A. Scarlatti, who in his early years was much influenced by Stradella. His best operas are *Il Floridoro*, also known as *Il Moro per amore*, and *Il Trespolo tutore*, a comic opera in three acts which worthily carried on the best traditions of Florentine and Roman comic opera in the 17th century. His church music, on which his reputation has generally been based, is of less importance, though the well-known oratorio *S. Giovanni Battista* displays the same skill in construction and orchestration (so far as the limited means at his disposal permitted) as the operas. A serenata for voices and two orchestras, *Qual prodigo ch'io miri*, was used by Handel as the basis of several numbers in *Israel in Egypt*, and was printed by Chrysander (Leipzig, 1888); the MS., however, formerly in the possession of Victor Schoelcher, from which Chrysander made his copy, has entirely disappeared. The well-known aria *Pietà, signore*, also sung to the words *Se i miei sospiri*, cannot possibly be a work of Stradella, and there is every reason to suppose that it was composed by Fétis, Niedermeyer or Rossini.

The finest collection of Stradella's works extant is that at the Biblioteca Estense at Modena, which contains 148 MSS., including four operas, six oratorios and several other compositions of a semi-dramatic character. A collection of *cantate a voce sola* was bequeathed by the Contarini family to the library of St Mark at Venice; and some MSS. are also preserved at Naples and in Paris. Eight madrigals, three duets, and a sonata for two violins and bass will be found among the Additional MSS. at the British Museum, five pieces among the Harleian MSS., and eight cantatas and a motet among those in the library at Christ Church, Oxford. The Fitzwilliam Museum at Cambridge possesses a large number of his chamber-cantatas and duets.

See also Heinz Hess, *Die Opern Alessandro Stradellas* (Leipzig, 1905), which includes the most complete catalogue yet made of Stradella's extant works; Catelani, *Delle Opere di A. Stradella insienti nell' archivio musicale della r. biblioteca palatina di Modena* (Modena, 1865); and Sedley Taylor, *The Indebtedness of Handel to other Composers* (Cambridge, 1906).

STRADIVARI, ANTONIO (1644–1737), Italian violin-maker, is associated throughout his life with Cremona, where he brought the craft of violin-making to its highest pitch of perfection. The obscure details of his life have been thoroughly worked out in the monograph on him by W. H Hill, A. F. Hill and Alfred Hill (1902). He was still a pupil of Nicolas Amati in 1666, when he had already begun to insert his own label on violins of his making, which at first follow the smaller Amati model, solidly constructed, with a thick yellow varnish. It was not till 1684 that he began to produce a larger model, using a deeper coloured varnish, and beautifying the instruments in various details, his "long" patterns (from 1690) representing a complete innovation in its proportions; while from 1700, after for a few years returning to an earlier style, he again broadened and otherwise improved his model. He also made some beautiful violoncellos and violas. The most famous instruments by him are:—*Violins*: the "Hellier" (1679), the "Sellière" (before 1680), the "Tuscan" (1690), the "Betts" (1704), the "Ernst" (1709), "La Pucelle" (1709), the "Viotti" (1709), the "Vieuxtemps" (1710), the "Parke" (1711), the "Boissier" (1713), the "Dolphin" (1714), the "Gillot" (1715), the "Alard," the finest of all (1715), the "Cessot" (1716), the "Messiah" (1716), the "Sasserno" (1717), the "Maurin" (1718), the "Lauterbach" (1719), the "Blunt" (1721), the "Sarasate" (1724), the "Rode" (1722), the "Deurbroucq" (1727), the "Kiesewetter" (1731), the "Habeneck" (1736), the "Muntz" (1736). *Violas*: the "Tuscan" (1690), two of 1696 formerly belonging to the king of Spain, the "Archinto" (1696), the "Macdonald" (1701), and the "Paganini" (1731). *Violoncellos:* the "Archinto" (1689), the "Tuscan" (1690), the "Aylesford" (1696), the "Cristiani" (1700), the "Servais" (1701), the "Gore-Booth" (1710), the "Duport" (1711), the "Adam" (1713), the "Batta" (1714), the "Piatti," the finest of all (1720), the "Bandiot" (1725), the "Gallay" (1725). Antonio Stradivari's sons Francesco (1671–1743) and Omobono (1679–1742) were also violin-makers, who assisted their father, together with Carlo Bergonzi, who appears to have succeeded to the possession of Antonio's stock-in-trade. The Stradivari method of violin-making created a standard for subsequent times; but what is regarded as Antonio's special advantage, now irrecoverable, was his varnish, soft in texture, shading from orange to red, the composition of which has been much debated. (See also VIOLIN.)

STRAFFORD, EARLS OF. The first earl of Strafford was Charles I.'s friend and adviser, Thomas Wentworth (see below). When he was attainted and executed in May 1641 his honours were forfeited, but later in the year his only son, William (1626–1695), was created earl of Strafford, his father's attainder being reversed by act of parliament in 1662. William died without issue on the 16th of October 1695, when all his titles, except the barony of Raby, became extinct. His estates passed to a kinsman, Thomas Watson, afterwards Watson-Wentworth (d. 1723), a son of Anne (1629–1695), daughter of the 1st earl, and her husband Edward Watson, 2nd Baron Rockingham. In 1746 Watson-Wentworth's son, Thomas Watson-Wentworth (*c.* 1690–1750), was created marquess of Rockingham, and when his son Charles, the 2nd marquess, died in 1782, the estates passed to his maternal nephew, William Fitzwilliam, 2nd Earl Fitzwilliam (1748–1833). His descendant, the present Earl Fitzwilliam, is the owner of Wentworth Woodhouse, near Rotherham, and the representative of the Wentworth family.

The barony of Raby passed to the 2nd earl's cousin, Thomas Wentworth (1672–1739), son and heir of Sir William Wentworth of Northgate Head, Wakefield. In early life he saw much service as a soldier in the Low Countries, and was occasionally employed on diplomatic errands. From 1711 to 1714 he was British ambassador at the Hague, and in 1711 he was created earl of Strafford. The earl was one of the British representatives at the congress of Utrecht, and in 1715 he was impeached for his share in concluding this treaty, but the charges against him were not pressed to a conclusion. He died on the 15th of November 1739. The earldom became extinct when Frederick Thomas, the 5th earl, died in August 1799. William, the 4th earl (1722–1791), had a sister Anne, who married William Connolly; and one of their daughters, Anne, married George Byng (d. 1789) of Wrotham Park, Middlesex. Their son, Sir John Byng (1772–1860), a distinguished soldier, was created earl of Strafford and Viscount Enfield in 1847. Having entered the army in 1793, Byng served in Flanders and commanded a brigade during the Peninsular War. He was present at Waterloo and became a field marshal in 1855. The earldom of Strafford is still held by his descendants.

STRAFFORD, THOMAS WENTWORTH, Earl of (1593–1641), English statesman, son of Sir William Wentworth, of Wentworth Woodhouse, near Rotherham, a member of an ancient family long established there, and of Anne, daughter of Sir Robert Atkins of Stowell, Gloucestershire, was born on the 13th of April 1593, in London. He was educated at St John's College, Cambridge, was admitted a student of the Inner Temple in 1607, and in 1611 was knighted and married Margaret, daughter of Francis Clifford, 4th earl of Cumberland. In 1614 he represented Yorkshire in the Addled Parliament, but, so far as is now known, it was not till the parliament of 1621, in which he sat for the same constituency, that he took part in the debates. His position towards the popular party was peculiar. He did not sympathize with their zeal for war with Spain, but James's denial of the rights and privileges of parliament seems to have caused him to join in the vindication of the claims of the House of which he was a member, and he was a warm supporter of the protestation which drew down a sentence of dissolution upon the third parliament of James.

In 1622 Wentworth's wife died, and in February 1625 he married Arabella Holles, daughter of the earl of Clare. He was returned for Pontefract to the parliament of 1624, but appears to have taken no part in the proceedings. He had no sympathy with the popular outcry against Spain nor for wars undertaken for religious considerations to the neglect of the practical interests of the country. He desired also to avoid foreign complications and "do first the business of the commonwealth." To the advances of Buckingham he replied coldly that "he was ready to serve him as an honest man and a gentleman." In the first parliament of Charles I., June 1625, he again represented Yorkshire, and at once marked his hostility to the proposed war with Spain by supporting a motion for an adjournment before the house proceeded to business. He took part in the opposition to the demand made under the influence of Buckingham for war subsidies, and was consequently, after the dissolution in November, made sheriff of Yorkshire, in order to exclude him from the parliament which met in 1626. Yet he had never taken up an attitude of antagonism to the king. His position was very different from that of the regular opposition. He was anxious to serve the Crown, but he disapproved of the king's policy. In January 1626 he had asked for the presidency of the council of the North, and had visited and been favourably received by Buckingham. But after the dissolution of the parliament he was dismissed from the justiceship of the peace and the office of *custos rotulorum* of Yorkshire, to which he had been appointed in 1615, as the result probably of his resolution not to support the court in its design to force the country to contribute money without a parliamentary grant. At all events he refused in 1627 to contribute to the forced loan, and was imprisoned in consequence.

Wentworth's position in the parliament of 1628 was a striking one. He joined the popular leaders in resistance to arbitrary taxation and imprisonment, but he tried to obtain his end with the least possible infringement of the prerogative of the Crown, to which he looked as a reserve force in times of crisis. With the approbation of the House he led the movement for a bill which would have secured the liberties of the subject as completely as the Petition of Right afterwards did, but in a manner less offensive to the king. The proposal was wrecked between the uncompromising demands of the parliamentary party who would give nothing to the prerogative and Charles's refusal to make the necessary concessions, and the leadership was thus snatched from Wentworth's hands by Eliot and Coke. Later in the session he fell into conflict with Eliot, as, though he supported the Petition of Right in substance, he was anxious to come to a compromise with the Lords, so as to leave room to the king to act unchecked in special emergencies.

On the 22nd of July 1628, not long after the prorogation, Wentworth was created Baron Wentworth, and received a promise of the presidentship of the Council of the North at the next vacancy. This implied no change of principle whatever. He was now at variance with the parliamentary party on two great subjects of policy, disapproving both of the intention of parliament to seize the powers of the executive and also its inclination towards puritanism. When once the breach was made it naturally grew wider, partly from the engrossing energy which each party put into its work, and partly from the personal animosities which of necessity arose. Such and no other was the nature of Wentworth's so-called "apostacy."

As yet Wentworth took no part in the general government of the country. In December he became Viscount Wentworth and president of the Council of the North. In the speech delivered at York on his taking office he announced his intention, almost in the words of Bacon, of doing his utmost to bind up the prerogative of the Crown and the liberties of the subject in indistinguishable union. "Whoever," he said, "ravels forth into questions the right of a king and of a people shall never be able to wrap them up again into the comeliness and order he found them." His government here was characterized by the same feature which afterwards marked his administration in Ireland and which it was the gravest charge in his impeachment that he intended to introduce into the whole English administration, namely the attempt to centralize all power with the executive at the expense of the individual in defiance of those constitutional liberties which ran counter to and impeded this policy.

The session of 1629 ended in a breach between the king and the parliament which made the task of a moderator hopeless. Wentworth had to choose between helping a Puritan House of Commons to dominate the king and helping the king to dominate a Puritan House of Commons. He instinctively chose the latter course, and he threw himself into the work of repression with characteristic energy, as if the establishment of the royal power was the one thing needful. Yet even when he was most resolute in crushing resistance he held that he and not his antagonists were maintaining the old constitution, which they had attempted to alter by claiming supremacy for parliament.

In November 1629 Wentworth became a privy councillor. In October 1631 he lost his second wife, and in October 1632 he married Elizabeth, daughter of Sir Godfrey Rhodes. In January 1632 he had been named lord-deputy of Ireland, and arrived in Dublin in July 1633.

Here he had to deal with a people who had not arrived at national cohesion, and amongst whom English colonists had been from time to time introduced, some of them, like the early Norman settlers, being Roman Catholics, whilst the later importations stood aloof and preserved their Protestantism. In his government here he showed the most remarkable abilities as a ruler. "The lord deputy of Ireland," wrote Sir Thomas Roe to the queen of Bohemia, "doth great wonders and governs like a king, and hath taught that kingdom to show us an example of envy, by having parliaments and knowing wisely how to use them." He reformed the administration, getting rid summarily of the inefficient English officials. He succeeded in so manipulating the parliaments that he obtained the necessary grants, and secured their co-operation in various useful legislative enactments. He set on foot a new victualling trade with Spain, established or promoted the linen manufacture, and encouraged the development of the resources of the country in many directions. The customs rose from a little over £25,000 in 1633–1634 to £57,000 in 1637–1638. He raised an army. He swept the pirates from the seas. He reformed and instilled life into the Church and rescued church property. His strong and even administration broke down the tyranny of the great men over the poor. Such was the government of "Thorough," as Strafford expresses it. Yet these good measures were all carried out by arbitrary methods which diminished their usefulness and their stability. Their aim moreover was not the prosperity of the Irish community but the benefit to the English exchequer, and Strafford suppressed the trade in cloth "lest it should be a means to prejudice that staple commodity of England." [1] Extraordinary acts of despotism took place, as in the case of Esmond, Lord Chancellor Loftus and Lord Mountnorris, the last of whom Strafford caused to be sentenced to death

[1] Strafford's Report of 1636. *Cat. of State Papers; Irish, 1633–1647*, p. 134.

in order to obtain the resignation of his office, and then pardoned. Promises of legislation such as the concessions known as the "graces" were not kept. In particular Strafford set at naught Charles's promise that no colonists should be forced into Connaught, and in 1635 he proceeded to that province, where, raking up an obsolete title—the grant in the 14th century of Connaught to Lionel, duke of Clarence, whose heir Charles was—he insisted upon the grand juries in all the counties finding verdicts for the king. One only, that of Galway, resisted, and the confiscation of Galway was effected by the court of exchequer, while he fined the sheriff £1000 for summoning such a jury, and cited the jurymen to the castle chamber to answer for their offence. In Ulster the arbitrary confiscation of the property of the city companies aroused dangerous animosity against the government. Towards the native Irish Wentworth's bearing was benevolent but thoroughly unsympathetic. Having no notion of developing their qualities by a process of natural growth, his only hope for them lay in converting them into Englishmen as soon as possible. They must be made English in their habits, in their laws and in their religion. "I see plainly," he once wrote, "that, so long as this kingdom continues popish, they are not a people for the Crown of England to be confident of." High-handed as Wentworth was by nature, his rule in Ireland made him more high-handed than ever. As yet he had never been consulted on English affairs, and it was only in February 1637 that Charles asked his opinion on a proposed interference in the affairs of the Continent. In reply, he assured Charles that it would be unwise to undertake even naval operations till he had secured absolute power at home. He wished that Hampden and his followers "were well whipped into their right senses." The opinion of the judges had given the king the right to levy ship-money, but, unless his majesty had "the like power declared to raise a land army, the Crown" seemed "to stand upon one leg at home, to be considerable but by halves to foreign princes abroad." When the Scottish Puritans rebelled he advocated the most decided measures of repression, in February 1639 sending the king £2000 as his contribution to the expenses of the coming war, at the same time deprecating an invasion of Scotland before the English army was trained, and advising certain concessions in religion.

Wentworth arrived in England in September 1639, after Charles's failure in the first Bishops' War, and from that moment he became Charles's principal adviser. Ignorant of the extent to which opposition had developed in England during his absence, he recommended the calling of a parliament to support a renewal of the war, hoping that by the offer of a loan from the privy councillors, to which he himself contributed £20,000, he would place Charles above the necessity of submitting to the new parliament if it should prove restive. In January 1640 he was created earl of Strafford, and in March he went to Ireland to hold a parliament, where the Catholic vote secured a grant of subsidies to be used against the Presbyterian Scots. An Irish army was to be levied to assist in the coming war. When in April Strafford returned to England he found the Commons holding back from a grant of supply, and tried to enlist the peers on the side of the king. On the other hand he induced Charles to be content with a smaller grant than he had originally asked for. The Commons, however, insisted on peace with the Scots. Charles, on the advice, or perhaps by the treachery of Vane, returned to his larger demand of twelve subsidies; and on the 9th of May, at the privy council, Strafford, though reluctantly, voted for a dissolution. The same morning the Committee of Eight of the privy council met again. Vane and others were for a mere defence against invasion. Strafford's advice was the contrary. "Go on vigorously or let them alone . . . . go on with a vigorous war as you first designed, loose and absolved from all rules of government, being reduced to extreme necessity, everything is to be done that power might admit. . . . . You have an army in Ireland you may employ here to reduce this kingdom . . . ." He tried to force the citizens of London to lend money. He supported a project for debasing the coinage and for seizing bullion in the Tower, the property of foreign merchants. He also advocated the purchase of a loan from Spain by the offer of a future alliance. He was ultimately appointed to command the English army, and was made a knight of the Garter, but he was seized with illness. and the rout of Newburn made the position hopeless. "Pity me," he wrote to his friend Sir George Radcliffe, "for never came any man to so lost a business . . . . In one word here alone to fight with all these evils, without any one to help." In the great council of peers, which assembled on the 24th of September at York, the struggle was given up, and Charles announced that he had issued writs for another parliament.

The Long Parliament assembled on the 3rd of November 1640, and Charles immediately summoned Strafford to London, promising that he "should not suffer in his person, honour or fortune." He arrived on the 9th and on the 10th proposed to the king to forestall his impeachment, now being prepared by the parliament, by accusing the leaders of the popular party of treasonable communications with the Scots. The plan however having been betrayed, Pym immediately took up the impeachment to the Lords on the 11th. Strafford came to the house to confront his accusers, but was ordered to withdraw and committed into custody. On the 25th of November the preliminary charge was brought up, whereupon he was sent to the Tower, and, on the 31st of January 1641, the accusations in detail were presented. These were, in sum, that Strafford had endeavoured to subvert the fundamental laws of the kingdom, and that the attempt was high treason. Much stress was laid on Strafford's reported words, already cited—"You have an army in Ireland you may employ here to reduce this kingdom," England, it being contended, and not Scotland being here meant. It is clear nevertheless that however tyrannical and mischievous Strafford's conduct may have been, his offense was not one which could by any straining of language be included in the limits of high treason; while the copy of a copy of rough notes of Strafford's speech in the committee of the council, the genuineness of which was asserted only by the defendant's accusers or personal enemies and not supported by other councillors who had also been present on the occasion, could not be evidence which would convict in a court of law. In addition, the words had to be arbitrarily interpreted as referring to the subjection of England and not of Scotland, and were also spoken on a privileged occasion. Advantage was freely taken by Strafford of the weak points in the attack, and the lords, his judges, were considerably influenced in his favour. But behind the legal aspect of the case lay the great constitutional question of the responsibility to the nation of the leader of its administration, a principle which was now to be revived after many centuries of neglect, and, in the circumstances which then prevailed, could only be enforced by the destruction of the offender. The Commons therefore, feeling their victim slipping from their grasp, dropped the impeachment, and brought in and passed a bill of attainder, though owing to the opposition of the Lords, and Pym's own preference for the more judicial method, the procedure of an impeachment was practically adhered to. Strafford might still have been saved but for the king's ill-advised conduct. A scheme to gain over the leaders of the parliament, and a scheme to seize the Tower and to liberate Strafford by force, were entertained concurrently and were mutually destructive; and the revelation of the army plot on the 5th of May caused the Lords to pass the attainder. Nothing now remained but the king's signature. Charles had, after the passing of the attainder by the Commons, for the second time assured Strafford "upon the word of a king, you shall not suffer in life, honour or fortune." Strafford now wrote releasing the king from his engagements and declaring his willingness to die in order to reconcile Charles to his subjects. "I do most humbly beseech you, for the preventing of such massacres as may happen by your refusal, to pass the bill; by this means to remove . . . the unfortunate thing forth of the way towards that blessed agreement, which God, I trust, shall for ever establish between you and your subjects."

Finally Charles yielded, giving his fatal assent on the 10th of May. Strafford met his fate on the 12th of May on Tower Hill, receiving Laud's blessing, who was then also imprisoned in the Tower, on his way to execution.

Thus passed into history "the great person," as Clarendon well calls him, without doubt one of the most striking figures in the annals of England. Strafford's patriotism and ideas were fully as noble as those of his antagonists. Like Pym, a student of Bacon's wisdom, he believed in the progress of England along the lines of natural development, but that development, in opposition to Pym, he was convinced could only proceed with the increase of the power of the executive, not of the parliament, with a government controlled by the king and not by the people. He was equally an upholder of the union of interests and affection between the sovereign and his subjects, but believed this could only exist when the king's will, and not that of the parliament, was paramount. The development of the constitution, in his opinion, either in the direction of a democracy or an aristocracy, was equally fatal and could only lead to anarchy, to the waste of national resources and to degeneration. With a strong and untrammelled executive directed by a single will, wise reforms could be carried out, the weak defended against the strong, the resources of the country developed to their full extent, the hesitations, delays and contradictions caused by barren discussions avoided, and the national forces concentrated on objects worth the aim. For one brief moment it was given to Strafford to carry out his ideals, and the final failure of his Irish administration, and especially its inability to endure in spite of its undoubted successes, has afforded an object-lesson in one-man government for all time. If such was the event in Ireland, where political ideas were still rude and elementary, still less could success be expected from the attempt to introduce the centralization and absolute power of the executive into England, where principles of government had been highly developed both in theory and practice, and a contrary tendency had long been established towards the increase of the rights of the individual and the power of parliament.

While arousing in the course of his career the most bitter enmities—and no man's death was ever received with more public rejoicing—Strafford was capable of inspiring strong friendships in private life. Sir Thomas Roe speaks of him as "Severe abroad and in business, and sweet in private conversation; retired in his friendships but very firm; a terrible judge and a strong enemy." His appearance is described by Sir Philip Warwick: "In his person he was of a tall stature, but stooped much in the neck. His countenance was cloudy whilst he moved or sat thinking, but when he spake, either seriously or facetiously, he had a lightsome and a very pleasant air; and indeed whatever he then did he performed very gracefully." He himself jested on his own "bent and ill-favoured brow," Lord Exeter replying that had he been "cursed with a meek brow and an arch of white hair upon it," he would never "have governed Ireland nor Yorkshire."

Strafford was married three times: (1) in 1611 to Lady Margaret Clifford, daughter of Francis, 4th earl of Cumberland; (2) in 1625 to Lady Arabella Holles, daughter of John, 1st earl of Clare; (3) in 1632 to Elizabeth, daughter of Sir Godfrey Rhodes. He left three daughters and one son, William, 2nd earl of Strafford.

See the article on Strafford in the *Dict. Nat. Biog.* by S. R. Gardiner; Strafford's *Letters*, ed. by W. Knowler (1739); R. Browning's *Life of Strafford*, with introduction by C. H. Firth (1892); *Papers relating to Thos. Wentworth*, ed. by C. H. Firth for the Camden Society (1890), Camden *Miscellany*, vol. ix.; *Private Letters from the Earl of Strafford to his third Wife* (Philobiblon Soc. Biog. & Hist. Misc. 1854, vol. i.); Lives by H. D. Traill (1889) in "English Men of Action Series," and by Elizabeth Cooper (1886); *Cat. of State Papers, Domestic and Irish*, esp. *1633–1647 Introduction*; *Hist. MSS. Comm. MSS. of Earl Cowper*; Strafford's *Correspondence*, of which the volumes published by Knowler represent probably only a small selection, remains still in MS. in the collection of Earl Fitzwilliam at Wentworth Woodhouse. (P. C. Y.)

STRAIN (through O. Fr. *straindre, estraindre*, mod. *étreindre*, from Lat. *stringere*, to draw tight, related to stress, stretch, string, &c.), to draw out, extend, stretch, especially with the idea of great effort or beyond measure or limit; hence, from the idea of pressure or constriction, to separate coarser matter or light solids from a liquid by pressure through a "strainer," which may be either a sieve or a colander (Lat. *colare*, to strain), a metal vessel with perforations in the bottom. Another type is the filter (*q.v.*). Straining can also be effected by means of cloths, and the name strainer is used of a coarse open cloth usually of flax; a coarser cloth of a more open texture is technically known as "screw."

For "strains" and "stresses" in physics see MECHANICS; ELASTICITY and STRENGTH OF MATERIALS.

STRAITS SETTLEMENTS, the collective name given to the crown colony formed by the British possessions on or adjacent to the mainland of the Malay Peninsula, as opposed to the Federated Malay States, the British protectorates in the same region. The Straits Settlements consist of the island of Singapore with about a score of islets of insignificant size lying in its immediate vicinity, of the town and territory of Malacca, the islands and territory of the Dindings, the island of Penang, sometimes officially called Prince of Wales Island, and Province Wellesley.

The colony of the Straits Settlements is administered by the governor with the aid of an executive council, composed wholly of official members, and there is a legislative council, composed partly of official and partly of nominated members, of which the former have a narrow permanent majority. The governor of the Straits Settlements is also high commissioner for the Federated Malay States of the peninsula, for British North Borneo, Brunei and Sarawak in Borneo, and since the administration of the colony of Labuan, which for a period was vested in the British North Borneo Company, has been resumed by the British government he is also governor of Labuan. The Cocos Keeling Islands (which were settled and are still owned by a Scottish family named Ross) and Christmas Island were formerly attached to Ceylon, but in 1886 the care of these islands was transferred to the government of the Straits Settlements. Penang and Malacca are administered, under the governor, by resident councillors. British residents control the native states of Pĕrak, Selāngor, Nĕgri Sembīlan and Pahang, but since the 1st of July 1896, when the federation of these states was effected, a resident-general, responsible to the high commissioner, has been placed in supreme charge of all the protectorates in the peninsula. The work of administration, both in the colony and in the Federated Malay States, is carried on by means of a civil service whose members are recruited by competitive examination held annually in London.

Population.—The following are the area and population, with details of race distribution, of the colony of the Straits Settlements, the figures being those of the census of 1901:—

	Area in Square Miles.	Population in 1891.	Population in 1901.						
			Total.	Europeans.	Eurasians.	Chinese.	Malays.	Indians.	Other Nationalities.
Singapore	206	184,554	228,555	3824	4120	164,041	36,080	17,823	2667
Penang, Province Wellesley and Dindings	381	235,618	248,207	1160	1945	98,424	106,000	38,051	2627
Malacca	659	92,170	95,487	74	1598	19,468	72,978	1,276	93
Total	1246	512,342	572,249	5058	7663	281,933	215,058	57,150	5387

The population, which was 306,775 in 1871 and 423,384 in 1881, had in 1901 reached a total of 572,249. As in former years, the increase is solely due to immigration, more especially of Chinese, though a considerable number of Tamils and other natives of India annually settle in the Straits Settlements. The total number of births registered in the colony during the year 1900 was 14,814, and the ratio per 1000 of the population during 1896, 1897 and 1898 respectively was 22·18, 20·82 and 21·57; while the number of registered deaths for the years 1896–1900 gave a ratio per 1000 of 42·21, 36·90, 30·43, 31·66 and 36·25 respectively, the number of deaths registered during 1900 being 23,385. The cause to which the excess of deaths over births is to be attributed is to be found in the fact that the Chinese and Indian population, which numbers 339,083, or over 59% of the whole, is composed of 261,412 males and only 77,671 females, and a comparatively small number of the latter are married women and mothers of families. The male Europeans also outnumber the females by about two to one; and among the Malays and Eurasians, who alone have a fair proportion of both sexes, the infant mortality is always excessive, this being due to early marriages and other well-known causes. The number of immigrants landing in the various settlements during 1906 was: Singapore 176,587 Chinese; Penang 56,333 Chinese and 52,041 natives of India; and Malacca 598 Chinese. The total number of immigrants for 1906 was therefore 285,560, as against 39,136 emigrants, mostly Chinese returning to China. In 1867, the date of the transfer of the colony from the East India Company to the Crown, the total population was estimated at 283,384.

Finance.—The revenue of the colony in 1868 only amounted to $1,301,843. That for 1906 was $9,512,132, exclusive of $106,180 received on account of land sales. Of this sum $6,650,558 was derived from import duties on opium, wines and spirits, and licences to deal in these articles, $377,972 from land revenue, $592,962 from postal and telegraphic revenue, and $276,019 from port and harbour dues. The expenditure, which in 1868 amounted to $1,197,177, had risen in 1906 to $8,747,819. The total cost of the administrative establishments amounted to $4,450,791, of which $2,586,195 was on account of personal emoluments and $1,864,596 was on account of other charges. The military expenditure (the colony pays on this account 20% of its gross revenue to the Imperial government by way of military contribution) amounted in 1906 to $1,762,438. A sum of $578,025 was expended on upkeep and maintenance of existing public works, and $1,209,291 on new roads, streets, bridges and buildings.

The Dindings and Province Wellesley.—The various settlements of which the colony of the Straits Settlements is composed, and the protectorates named in this article, are all dealt with separately, except the Dindings and Province Wellesley. The former, which consists of some islands near the mouth of the Pērak River and a small piece of territory on the adjoining mainland, belonged originally to Pērak, and was ceded to the British government under the treaty of Pangkor in 1874. Hopes were entertained that its excellent natural harbour would prove to be valuable, but these have been doomed to disappointment, and the islands, which are sparsely inhabited and altogether unimportant both politically and financially, are now administered by the government of Pērak.

Province Wellesley, which is situated on the mainland opposite to the island of Penang, was ceded to Great Britain by the sultan of Kedah in 1798. It marches with Pērak on the south, but on the north and east with Kedah. The boundary with Kedah was rectified by treaty with Siam in 1867. It is administered by a district officer, with some assistants, who is responsible to the resident councillor of Penang. The country consists, for the most part, of fertile plain, thickly populated by Malays, and occupied in some parts by sugar-planters and others engaged in similar agricultural industries and employing Chinese and Tamil labour. About a tenth of the whole area is covered by low hills with thick jungle. Large quantities of rice are grown by the Malay inhabitants, and between October and February there is excellent snipe-shooting to be had in the paddy-fields. A railway from Bātu Kāwan, opposite to Penang, runs through Province Wellesley into Pērak, and thence via Selāngor and the Negri Sembilan to Malacca. There is also an extension via Mūar, which is under the rule of the sultan of Johor, and through the last-named state to Johor Bharu, opposite the island of Singapore.

(H. Cl.)

STRALSUND, a seaport of Germany, in the Prussian province of Pomerania, on the west side of the Strelasund, an arm of the Baltic, 1½ m. wide, which separates the island of Rügen from the mainland, 135 m. by rail N. from Berlin and 45 m. N.W. of Rostock. Pop. (1905), 31,813, of whom more than a fourth reside in the Knieper, Tribseeser, Franken and other suburbs on the mainland. A steam railway ferry connects it with the island railway on Rügen, and so with Sassnitz, whence a regular steamboat mail service affords communication with Trelleborg in Sweden. The situation of the town proper, on a small triangular islet only connected with the mainland by three moles and bridges at the angles, has always rendered its fortification comparatively easy, and down to 1873 it was a fortress of the first rank. Since that year the ramparts have been levelled and their site occupied by public promenades and gardens. The defences of the place are now solely confined to the island of Dänholm, known down to the 13th century as Strehla or Strehlo, lying in the Sound. The quaint architecture of the houses, many of which present their curious and handsome gables to the street, gives Stralsund an interesting and old-fashioned appearance. The four Gothic churches of St Nicholas,[1] St Mary, with a lofty steeple, St James and The Holy Ghost, and the fine medieval town hall, dating in its oldest part from 1306 and restored in 1882, are among the more striking buildings. The last houses the provincial antiquarian museum and the municipal library of 70,000 volumes. There is a fine monument commemorating the war of 1870-71, one (1859) to the local patriot Ferdinand von Schill, and another (1900) to the poet and patriot E. M. Arndt. Among the educational establishments of the place must be mentioned the classical school (Gymnasium), founded in 1560, and a school of navigation. The manufactures of Stralsund are more miscellaneous than extensive; they include machinery, playing cards, sugar, soap, cigars, gloves, furniture, paper, oil and beer. The trade is chiefly confined to the shipping of grain, fish, coal, malt and timber, with some cattle and wool, and to the import of coal and tar, but of late years it has declined, despite excellent wharf accommodation and a considerable depth of water (12-15 ft.). Stralsund entertains passenger-boat communications with Barth, Stettin, Rostock and Lübeck as well as with various small ports on the isle of Rügen.

Stralsund was founded in 1234, and, though several times destroyed, steadily prospered. It was one of the five Wendish towns whose alliance extorted from King Eric of Norway a favourable commercial treaty in 1284–1285; and in the 14th century it was second only to Lübeck in the Hanseatic League. Although under the sway of the dukes of Pomerania, the city was able to maintain a marked degree of independence, which is still apparent in its municipal privileges. Its early Protestant sympathies placed it on the side of Sweden during the Thirty Years' War, and in 1628 it successfully resisted a siege of eleven weeks by Wallenstein, who had sworn to take it "though it were chained to heaven." He was forced to retire with the loss of 12,000 men, and a yearly festival in the town still celebrates the occasion. After the peace of Westphalia Stralsund was ceded with the rest of Western Pomerania to Sweden; and for more than a century and a half it was exposed to attack and capture as the *tête-de-pont* of the Swedes in continental Europe. It was taken by France in 1807, and in 1815 it passed to Prussia. In 1809 it was the scene of the death of Ferdinand von Schill, in his gallant though ineffectual attempt to rouse his countrymen against the French invaders.

See Mohnike and Zober, *Stralsundische Chroniken* (Stralsund, 1833–1834); Israel, *Die Stadt Stralsund* (Leipzig, 1893); Baier, *Stralsundische Geschichten* (Stralsund, 1902); and T. Reishaus, *Wallenstein und die Belagerung Stralsunds* (Stralsund, 1887).

[1] A remarkable series of 14th-century frescoes, in perfect condition, were disclosed in 1909 by the removal of the whitewash which had for centuries covered the interior of this fine church.

STRAMONIUM, in medicine, a drug obtained from the leaves and seeds of the *Datura stramonium*. Both contain an alkaloid known as daturine. From the seeds is made *extractum stramonii*. The *tinctura stramonii* is made from the leaves. The physiological action of stramonium resembles that of belladonna, except that stramonium relaxes to a greater extent the unstriped muscle of the bronchial tubes; for this reason it is used in asthma to relieve the bronchial spasm. Cigarettes made of stramonium leaves may be smoked or the tincture may be taken internally. Frequently the leaves powdered together with equal quantities of the powdered leaves of the *Cannabis Indica* and lobelia mixed with potassium nitrate are burned in an open dish. The preparation gives off dense fumes which afford great relief to the asthmatic paroxysm. Numerous patent "cures" for asthma contain these ingredients in varying proportions. Daturine is used as *daturinae sulphas*. In acute mania it acts like hyoscyamine in producing sleep. In large doses stramonium is a narcotic poison producing the well-marked stages of exaltation of function, diminution of functional activity, and later loss of function, sinking into coma and paralysis.

STRANG, WILLIAM (1859–), English painter and engraver, was born at Dumbarton, N.B., on the 13th of February 1859, the son of Peter Strang, builder. He was educated at the Dumbarton Academy, and worked for fifteen months in the counting-house of a firm of shipbuilders. He went to London in 1875 when he was sixteen, and studied his art under Alphonse Legros at the Slade School for six years. Strang became assistant master in the etching class, and himself followed this art with great success. He was one of the original members of the Royal Society of Painter-Etchers, and exhibited at their first exhibition in 1881. Some of his early plates were published in the *Portfolio* and other art magazines. He worked in many manners, etching, dry point, mezzotint, sand-ground mezzotint, and burin engraving, and invented a draw-burin of his own. Lithography and wood-cutting were also used by him to reproduce his abundant imaginings. He cut a large wood-engraving of a man ploughing, that has been published by the Art for Schools Association. A privately produced catalogue of his engraved work contains more than three hundred items. Amongst his earlier works "Tinkers," "St Jerome," "A Woman washing her Feet," an "Old Book-stall with a man lighting his pipe from a flare," and "The head of a Peasant Woman," on a sand-ground mezzotint, may be remembered. Later plates such as "Hunger," "The Bachelor's End" and "The Salvation Army" cannot be forgotten. Some of his best etchings have been in series; one of the earliest, illustrating William Nicholson's ballad of "Aken Drum," is remarkable for delicate and clear workmanship in the shadow tones, showing great skill and power over his materials, and for strong drawing. Another good series was the "Pilgrim's Progress," revealing austere sympathy with Bunyan's teaching. Coleridge's "Ancient Mariner" and Strang's own "Allegory of Death" and the "Plowman's Wife," have served him with suitable imaginative subjects. Some of Rudyard Kipling's stories have been illustrated by him, too, and Strang's portrait of Kipling has been one of his most successful portrait plates. Other good etched portraits are of Mr Ernest Sichel, fine as a Vandyck, and of Mr J. B. Clark, with whom Strang collaborated in illustrating *Baron Munchausen* and *Sinbad the Sailor* and *Ali Baba*, published in 1895 and 1896. Thomas Hardy, Henry Newbolt and many other distinguished men also sat to him. Proofs from these plates have been much valued; in fact, Strang's portrait etchings have inaugurated a new form of reproductive portraiture. A portrait which is a work of art and can be reproduced a number of times without losing any of its art qualities is one ideal way of recording appearances, as such prints can be treasured by many owners. Strang produced a number of good paintings, portraits, nude figures in landscapes, and groups of peasant families, which have been exhibited in the Royal Academy, the International Society, and several German exhibitions. He painted a decorative series of scenes from the story of Adam and Eve for the library of Mr Hodson of Wolverhampton; they were exhibited at the Whitechapel exhibition in 1910. Some of his drawings from the nude model in silver point and red and black chalk are very beautiful as well as powerful and true. He also painted a number of landscapes, mostly of a small size. In later years he developed a style of drawing in red and black chalk, with the whites and high lights rubbed out, on paper stained with water colour. This method gives qualities of delicate modelling and refined form and gradations akin to the drawings of Holbein. He drew portraits in this manner of many members of the Order of Merit for the royal library at Windsor Castle. In 1902 Strang retired from the Royal Society of Painter-Etchers, as a protest against the inclusion in its exhibitions of etched or engraved reproductions of pictures. His work was subsequently seen principally in the exhibitions of the Society of Twelve, of the International Society, to which body he was elected in 1905, and of the Royal Academy. Strang was elected an associate engraver of the Royal Academy when that degree was wisely revived in 1906. (C. H.*)

STRANGE, SIR ROBERT (1721–1792), Scottish line engraver, descended from the Scottish family of Strange, or Strang, of Balcasky, Fife, was born in the mainland of Orkney, on the 14th of July 1721. In his youth he spent some time in an attorney's office; but, having manifested a taste for drawing, he was apprenticed, in 1735, to Richard Cooper, an engraver in Edinburgh. After leaving Cooper in 1741 he started on his own account as an engraver, and had attained a fair position when, in 1745, he joined the Jacobite army as a member of the corps of life-guards. He engraved a half-length of the Young Pretender, and also etched plates for a bank-note designed for the payment of the troops. He was present at the battle of Culloden, and after the defeat remained in hiding in the Highlands, but ultimately returned to Edinburgh, where, in 1747, he married Isabella, only daughter of William Lumisden, son of a bishop of Edinburgh. In the following year he proceeded to Rouen, and there studied drawing under J. B. Descamps, carrying off the first prize in the Academy of Design. In 1749 he removed to Paris, and placed himself under the celebrated Le Bas. It was from this master that he learned the use of the dry point, an instrument which he greatly improved and employed with excellent effect in his own engravings. In 1750 Strange returned to England. Presently he settled in London along with his wife and daughter, and superintended the illustrations of Dr William Hunter's great work on the *Gravid Uterus*, published in 1774. The plates were engraved from red chalk drawings by Van Rymsdyk, now preserved in the Hunterian Museum, Glasgow, and two of them were executed with great skill by Strange's own hand. By his plates of the "Magdalen" and "Cleopatra," engraved after Guido in 1753, he at once established his professional reputation. He was invited in 1759 to engrave the portraits of the prince of Wales and Lord Bute, by Allen Ramsay, but declined, on the ground of the insufficient remuneration offered and of the pressure of more congenial work after the productions of the Italian masters. His refusal was attributed to his Jacobite proclivities, and it led to an acrimonious correspondence with Ramsay, and to the loss, for the time, of royal patronage. In 1760 Strange started on a long-meditated tour in Italy. He studied in Florence, Naples, Parma, Bologna, and Rome, executing innumerable drawings, of which many—the "Day" of Correggio, the "Danae" and the "Venus and Adonis" of Titian, the "St Cecilia" of Raphael, and the Barberini "Magdalen" of Guido, &c.—were afterwards reproduced by his burin. On the Continent he was received with great distinction, and he was elected a member of the academies of Rome, Florence, Parma and Paris. He left Italy in 1764, and, having engraved in the French capital the "Justice" and the "Meekness" of Raphael, from the Vatican, he carried them with him to London in the following year. The rest of his life was spent mainly in these two cities, in the diligent prosecution of his art. In 1766 he was elected a member of the Incorporated Society of Artists, and in 1775, piqued by the exclusion of engravers from the Royal Academy, he published an attack on that body, entitled *An Enquiry into the Rise and Progress of the Royal Academy of Arts at London*, and prefaced by a long letter to Lord Bute. In 1787 he engraved West's "Apotheosis of the Princes Octavius and Alfred," and was rewarded with the honour of kinghthood. He died in London on the 5th of July 1792.

After his death a splendid edition of reserved proofs of his engravings was issued; and a catalogue of his works, by Charles Blanc, was published in 1848 by Rudolph Weigel of Leipzig, forming part of *Le Graveur en taille douce*.

See *Memoirs of Sir Robert Strange, Knt., and his Brother-in-law Andrew Lumisden*, by James Dennistoun of Dennistoun (1855).

STRANGFORD, VISCOUNT, an Irish title held by the family of Smythe, from 1625, when it was conferred upon Sir Thomas Smythe (d. 1635) of Ostenhanger and Ashford, Kent, until 1869, when it became extinct. From Sir Thomas the title passed down to his descendant, Percy Clinton Sydney Smythe (1780–1855), who succeeded his father, Lionel, as 6th viscount in 1801. Entering the diplomatic service in 1802, Smythe represented his country at Lisbon, in Brazil, at Stockholm, Constantinople and St Petersburg, and in 1825 he was created a peer of the United Kingdom as Baron Penshurst. He had literary tastes, and in 1803 published *Poems from the Portuguese of Camoëns, with Remarks and Notes*, Byron at this time describing him as "Hibernian Strangford"; he died on the 29th of May 1855.

His eldest son George Augustus Frederick Percy Sydney Smythe (1818–1857), who now became the 7th viscount, was associated with Disraeli and Lord John Manners in the conduct of the "Young England" party. He entered parliament in 1841, and was under-secretary for foregin affairs in 1845–1846, losing his seat at Canterbury in 1852. In 1852 he fought a duel at Weybridge with Colonel Frederick Romilly (1810–1887), the last encounter of this kind in England. Like his father, Smythe had literary tastes, and he is thought to be the original of Disraeli's *Coningsby*. In 1844 he wrote *Historic Fancies*, a collection of poems and essays, and his novel *Angelo Pisani* was published posthumously, with a memoir of the author in 1875. As a journalist he wrote in the *Morning Chronicle*. He died on the 23rd of November 1857, and was succeeded by his brother Percy Ellen Frederick William Sydney Smythe (1826–1869) as 8th viscount.

Born at St Petersburg on the 26th of November 1826, during all his earlier years Percy Smythe was nearly blind, in consequence, it was believed, of his mother having suffered very great hardships on a journey up the Baltic in wintry weather shortly before his birth. His health through life was very delicate, but did not prevent his showing quite early most remarkable powers of mind. His education was begun at Harrow, whence he went to Merton College, Oxford. From the very first he gave proofs of extraordinary ability as a linguist, and was nominated by the vice-chancellor of Oxford in 1845 a student-attaché at Constantinople. A very interesting account of his colleagues, more especially of Mr Almerick Wood, who was a man of phenomenal capacity, was written by him later in life, and is to be found in the two volumes of his collected essays published by his widow. While at Constantinople, where he served under Lord Stratford de Redcliffe, Percy Smythe gained a mastery not only of Turkish and its dialects, but of almost every form of modern Greek, from the language of the *literati* of Athens to the least Hellenized Romaic. Before he went to the East he had a large knowledge both of Persian and Arabic, but until his duties led him to study the past, present and future of the sultan's empire he had given no attention to the tongues which he well described as those of the international rabble in and around the Balkan peninsula. He made, while in the East, a careful study of these, and was the first Englishman to see that the Bulgarians were much more likely than the Servians to come to the front as the Ottoman power declined. He avowed himself a Liberal in English politics, and those with whom he chiefly lived were Liberals; but he was not an anti-Turk, as so many Liberals afterwards became. On succeeding to the peerage in 1857 he did not abandon the East, but lived on at Constantinople for several years, immersed in Oriental studies. At length, however, he returned to England and began to write a great deal, sometimes in the *Saturday Review*, sometimes in the *Quarterly*, and much in the *Pall Mall Gazette*. A rather severe review in the first of these organs of the *Egyptian Sepulchres and Syrian Shrines* of Emily Anne Beaufort (d. 1887) led to a result not very usual—the marriage of the reviewer and of the authoress. One of the most interesting papers Lord Strangford ever wrote was the last chapter in his wife's book on the *Eastern Shores of the Adriatic*. That chapter was entitled "Chaos," and was the first of his writings which made him widely known amongst careful students of foreign politics. From that time forward everything that he wrote was watched with intense interest, and even when it was anonymous there was not the slightest difficulty in recognizing his style, for it was unlike any other. He died in London on the 9th of January 1869, when his titles became extinct. *A Selection from the Writings of Viscount Strangford on Political, Geographical and Social Subjects* was edited by his widow and published in 1869. His *Original Letters and Papers upon Philology and Kindred Subjects* were also edited by Lady Strangford (1878).

See E. B. de Fonblanque, *Lives of the Lords Strangford through Ten Generations* (1877).

STRANRAER, a royal and police burgh and seaport of Wigtownshire, Scotland. Pop. (1901), 6036. It is situated at the head of Loch Ryan, an arm of the North Channel (Irish Sea), 59 m. S.S.W. of Ayr by the Glasgow & South-Western railway, with a station in the town and at the harbour. It lies 39 m. E. by N. of Larne in Co. Antrim, Ireland, with which there is daily communication by mail steamer. Stranraer, originally called St John's Chapel, became a burgh of barony in 1596, and a royal burgh in 1617. In the centre of the town are the ruins of the castle of the 15th century, occupied for a time by John Graham of Claverhouse, Viscount Dundee, when he held the office of sheriff of Galloway (1682). The principal buildings within the parish are the old town hall, now used as a volunteer drill hall and armoury; the county buildings, containing the town hall and court house; the academy; reformatory and the Wigtownshire combination poorhouse. Dairy utensils and implements are made; there are several nurseries; brewing and milling are carried on, but the bulk of the trade is in farm and dairy produce. Pier and harbour accommodation has been extended and the shipping is brisk. The oyster beds, for which Loch Ryan was once noted, are not cultivated, but the fisheries (white fish and herrings) are still of some consequence. Three miles east of Stranraer is Lochinch, the residence of the earl of Stair, a modern structure in the Scots Baronial style. It stands in grounds 4000 acres in extent, which include the White and Black Lochs and the ruins of Castle Kennedy, finely situated on the isthmus between the lakes. This castle was erected in the reign of James VI. for the earls of Cassilis, and passed into the hands of the Stair family in the 17th century. It was struck by lightning in 1716 and burned down and never rebuilt. The estate is famous for its plantations and Dutch gardens, the pinetum containing the most representative collection of araucarias, deodars and other conifers in Europe. A mile south are the green mounds marking the site of the abbey of Saulseat, founded for Premonstratensian monks by Fergus, "king" of Galloway, early in the 12th century. It stood on the banks of a small loch and was known as the Monastery of the Green Lake from the mass of confervae with which the water was continually covered. Four miles west by north of Stranraer is situated Lochnaw Castle, the ancient seat of the Agnews, who were hereditary sheriffs of Galloway till 1747, when hereditable jurisdictions were abolished. The five-storied embattled tower in the centre dates from 1426, and the modern mansions from 1820. On the coast, $7\frac{1}{2}$ m. south-west of Stranraer by rail, lies Portpatrick, formerly called Port Montgomerie. Owing to its proximity to Ireland ($21\frac{1}{2}$ m. to Donaghadee), it was for more than 200 years a starting-point of the mail service between Great Britain and Ireland. In consequence, however, of the frequent violence of the south-westerly gales and other causes, the communication ceased in the middle of the 19th century, and the artificial harbour designed by John Rennie has gradually fallen into decay. The town is in repute as a holiday resort for its healthy climate and beautiful situation.

STRASSBURG, or Strasburg (French *Strasbourg*), a town of Germany, the capital of the imperial province of Alsace-Lorraine and a fortress of the first rank, is situated in a fertile plain at the junction of the Ill and the Breusch, 2 m. W. of the Rhine, 88 m. by rail N. from Basel, 370 m. S.W. from Berlin, 30 m. E. of the French frontier. Pop. (1890), 123,500; (1900), 150,268; (1905), 167,342. Since 1871 it has been the seat of government for the German territory of Alsace-Lorraine, and it is also the see of a Roman Catholic bishop and the headquarters of the XV. Corps of the German army. It is surrounded by outlying fortifications and strategic works and contains a garrison of 16,000 men of all arms.

The town proper is divided by the arms of the Ill into three parts, of which the central is the largest and most important. Most of the streets in the heart of the city are narrow and irregular, and the quaint aspect of a free medieval town has to a considerable extent been maintained. The quarters which suffered most in the bombardment of 1870 have, however, been rebuilt in more modern fashion, and the recent widening of the circle of fortifications, with the destruction of the old walls, has given the city opportunity of expansion in all directions; thus, with the exception of Berlin and Leipzig, there is perhaps no town in Germany which can show so many handsome new public buildings as Strassburg. Of its older edifices by far the most interesting and prominent is the cathedral, or Münster, which in its present form represents the activity of four centuries. Part of the crypt dates from 1015; the apse shows the transition from the Romanesque to the Gothic style; and the nave, finished in 1275, is a fine specimen of pure Gothic. Of the elaborate west façade, with its screen of double tracery and its numerous sculptures, the original design was finished by Erwin von Steinbach (d. 1318). The upper part of the façade and the towers were afterwards completed in accordance with a different plan, and the spire on the north tower was added in 1435. This tower is 465 ft. high, being thus one of the highest buildings in Europe, and it commands a fine view. The cathedral has some fine stained glass, a sculptured pulpit and the famous astronomical clock in the south transept; this contains some fragments of the clock built by the mathematician, Conrad Dasypodius, in 1574. The Protestant church of St Thomas, a Gothic building of the 13th and 14th centuries, contains a fine monument of Marshal Saxe, considered the *chef d'œuvre* of the sculptor, Jean Baptiste Pigalle. Other notable churches are the Protestant Temple Neuf, or Neue Kirche, rebuilt since 1870, and the Roman Catholic church of the Sacred Heart, erected in 1889–1893.

The old episcopal palace, built in 1731–1741, was used for university purposes from 1872 to 1895; it is now the municipal museum of art. Other notable buildings are the Frauenhaus, with some interesting sculptures, and the Hôtel du Commerce, the finest Renaissance building in the town. The imperial palace, designed by H. Eggert in the Florentine Renaissance style, was built in 1889–1893; it is crowned by a cupola 115 ft. high and is richly ornamented. The provincial and university library, with over 800,000 volumes, and the hall of the provincial Diet (*Landesausschuss*), built in 1888–1892, both in the Italian Renaissance style, occupy the opposite side of the Kaiserplatz, and behind the latter is the large new post office. Between the university and the library is the Evangelical garrison church (1892–1897), built of reddish sandstone in the early Gothic style. The principal squares of the town are the Kaiserplatz, the Broglieplatz, the Schlossplatz and the Kleberplatz. Still to be mentioned are the Grosse Metzig, containing the Hohenlohe museum, the theatre, the town hall, and the so-called Aubette, with the conservatorium of music. A new synagogue was completed in 1898, and the viceregal palace was entirely rebuilt in 1872–1874. The town has new law courts, a Roman Catholic garrison church, an iron bridge across the Rhine to Kehl and statues of General Kleber and of the printer Gutenberg.

The university of Strassburg, founded in 1567 and suppressed during the French Revolution as a stronghold of German sentiment, was reopened in 1872; it now occupies a site in the new town and is housed in a handsome building erected for it in 1877–1894. This is adorned with statues and frescoes by modern German artists, and has near it the chemical, physical, botanical, geological, seismological and zoological institutes, also the observatory, all designed by Eggert and built between 1877 and 1888. On the south of the old town are the various schools, laboratories and hospitals of the medical faculty, all built since 1877. The university, which has six faculties, is attended by about 1400 students and has 130 professors. Other educational establishments are the Protestant gymnasium, founded in 1538, various seminaries for teachers and theological students and numerous schools.

The chief industries of Strassburg are tanning, brewing, printing and the manufacture of steel goods, musical instruments, paper, soap, furniture, gloves and tobacco. To these must be added the fattening of geese for Strassburg's celebrated *pâtés de foie gras*, which forms a useful source of income to the poorer classes. There is also a brisk trade in agricultural produce, hams, sausages, coal, wine, leather goods and hops. The development of this trade is favoured by the canals which connect the Rhine with the Rhone and the Marne, and by a new port of 250 acres in extent with quays and wharves on the Rhine, which has been constructed since 1891.

Strassburg has always been a place of great strategical importance, and as such has been strongly fortified. The pentagonal citadel constructed by Vauban in 1682–1684 was destroyed during the siege of 1870. The modern German system of fortification consists of a girdle of fourteen detached forts, at a distance of from three to five miles from the centre of the town. Kehl, the *tête-de-pont* of Strassburg, and several villages are included within this enceinte, and three of the outworks lie on the right bank of the Rhine, in the territory of Baden. In case of need the garrison can lay a great part of the environs under water.

The site of Strassburg was originally occupied as a Celtic settlement, which was captured by the Romans, who replaced it by the fortified station of *Argentoratum*, afterwards the headquarters of the eighth legion. In the year 357 the emperor Julian saved the frontier of the Rhine by a decisive victory gained here over the Alamanni, but about fifty years later the whole of the district now called Alsace fell into the hands of that people. Towards the end of the 5th century the town passed to the Franks, who gave it its present name. The famous "Strassburg oaths" between Charles the Bold and Louis the German were taken here in 842, and in 923, through the homage paid by the duke of Lorraine to the German king Henry I., began the connexion of the town with the German kingdom which was to last for over seven centuries. The early history of Strassburg consists mainly of struggles between the bishop and the citizens, the latter as they grew in wealth and power feeling that the fetters of ecclesiastical rule were inconsistent with their full development. This conflict was finally decided in favour of the citizens by the battle of Oberhausbergen in 1262, and the position of a free imperial city which had been conferred upon Strassburg by the German king, Philip of Swabia, was not again disputed. This casting off of the episcopal yoke was followed in 1332 by an internal revolution, which admitted the gilds to a share in the government of the city and impressed upon it the democratic character which it bore down to theFrench Revolution. Strassburg soon became one of the most flourishing of the imperial towns, and the names of natives or residents like Sebastian Brant, Johann Tauler and Geiler von Kaisersberg show that its eminence was intellectual as well as material.

In 1349 two thousand Jews were burned at Strassburg on a charge of causing a pestilence by poisoning the wells. In 1381 the city joined the Städtebund, or league of Swabian towns, and about a century later it rendered efficient aid to the Swiss confederates at Granson and Nancy. The reformed doctrines were readily accepted in Strassburg about 1523, its foremost champion here being Martin Bucer, and the city was skilfully piloted through the ensuing period of religious dissensions by Jacob Sturm von Sturmeck, who secured for it very favourable terms at the end of the war of the league of Schmalkalden. In the Thirty Years' War Strassburg escaped without molestation by observing a prudent neutrality. In 1681, during a time of peace, it was suddenly seized by Louis XIV., and this unjustifiable action received formal recognition at the peace of Ryswick in 1697. The immediate effect of this change was a partial reaction in favour of Roman Catholicism, but the city remained essentially German until the French Revolution, when it was deprived of its privileges as a free town and sank to the level of a French provincial capital. In the war of 1870–71 Strassburg, with its garrison of 17,000 men, surrendered to the Germans on the 28th of September 1871 after a siege of seven weeks. The city and the cathedral suffered considerably from the bombardment, but all traces of the havoc have now disappeared. Before the war more than half of the inhabitants spoke German, and this proportion has increased greatly of recent years, owing to the large influx of pure German elements into the city and the almost complete reconciliation of the older inhabitants to the rule of Germany.

The bishopric of Strassburg existed in the days of the Merovingian kings, being probably founded in the 4th century, and embraced a large territory on both banks of the Rhine, which was afterwards diminished by the creation of the bishoprics of Spires and Basel. The bishopric was in the archdiocese of Mainz and the bishop was a prince of the empire. The episcopal lands were annexed by France in 1789 and the subsequent Roman Catholic bishops of Strassburg discharged spiritual duties only.

For the history of the bishopric see Grandidier, *Histoire de l'église et des évêques-princes de Strasbourg* (Strassburg, 1775–1778); Glöckler, *Geschichte des Bistums Strasburg* (Strassburg, 1879–1880); and J. Fritz, *Das Territorium des Bistums Strasburg* (Strassburg, 1885).

For the city see the *Strassburger Chroniken*, edited by Hegel (Leipzig, 1870–1871); the *Urkunden und Akten der Stadt Strassburg* (Strassburg, 1879 seq.); G. Schmoller, *Strassburgs Blüte im 13. Jahrhundert* (Strassburg, 1875); Schricker, *Zur Geschichte der Universität Strassburg* (Strassburg, 1872); J. Kindler, *Das goldene Buch von Strassburg* (Vienna, 1885–1886); H. Ludwig, *Deutsche Kaiser und Könige in Strassburg* (Strassburg, 1889); A. Seyboth, *Strasbourg historique* (Strassburg, 1894); and C. Stahling, *Histoire contemporaine de Strasbourg* (Nice, 1884 seq.).

STRATA-FLORIDA (*Ystradflur*), the ruins of a celebrated Cistercian abbey of Cardiganshire, Wales, situated amidst wild and beautiful scenery near the source of the river Teifi. The abbey is 2 m. distant from the village of Pontrhydfendigaid (bridge of the blessed ford) on the Teifi, and about 4 m. from the station of Strata-Florida on the so-called Manchester and Milford branch line of the Great Western railway. The existing remains are not extensive, but the dimensions of the church, 213 ft. long by 61 ft. broad, are easily traceable, and excavations made at different times during recent years have brought to light encaustic tiles and other objects of interest. The most prominent feature of the ruined abbey is the elaborate western portal of the church, which is regarded as a unique specimen of the transitional Norman-English architecture of the 12th century. A fine silver seal of the abbey is preserved in the British Museum.

Founded and generously endowed in 1164 by Rhys ap Griffith, prince of South Wales, the Cistercian abbey of St Mary at Strata-Florida (which was probably a revival of an older monastic house on or near the same site) continued for over a century to be reckoned one of the wealthiest and most influential of the Welsh religious houses. It was much favoured by Welsh bards, nobles and princes, several of whom were buried in the adjoining cemetery; and in its library were deposited many official documents and records of the native princes. In 1138 Llewelyn ap Iorwerth, "the Great," summoned all his vassals to this spot to do homage to his heir, afterwards Prince David II. The abbey suffered severely during the Edwardian wars, and in or about 1294 a large portion of its buildings was destroyed by fire, though whether as the result of accident or design remains unknown; in any case Edward I. gave a donation of £75 towards the restoration of the fabric. During Owen Glendower's rebellion in Henry IV.'s reign, the abbey was held for some months by Harry of Monmouth (Henry V.) with a body of troopers. With the extinction of Welsh independence the abbey lost much of its wealth and influence, and at the dissolution of the monasteries its gross revenue was returned at only £122, 6s. 8d. a year, one Richard Talley being its last abbot. The fabric of the abbey and its surrounding lands came into the possession of the Stedman family, whose 17th-century mansion, built out of materials from the monastic buildings, has long been used as a farmhouse. By marriage the abbey and the estate of the Stedmans passed into the possession of the family of Powell of Nanteos.

STRATEGUS (στρατηγός), strictly the Greek word for a general, or officer in command of an army, but frequently the name of a state officer with much wider functions. Such an officer is found in many Greek states, the best known being the Athenian strategus, originally a military official, whose functions gradually developed until, in the latter half of the 5th century B.C., he became the most important magistrate in the state. According to Aristotle's *Constitution of Athens* iv., the office existed in the time of Draco and the qualification was property to the value of 100 minae (*i.e.* ten times as high as that for the archonship); but it is certain that until the end of the 6th century the archon (*q.v.*) was the most important state official. If, as is probable, the chapter in the *Constitution* is a forgery (see DRACO), we may conclude that the Strategia (board of ten generals) was a result of the tribal system of Cleisthenes, and that the college is to be ascribed to the year 501 B.C. Some maintain that Cleisthenes himself created it, but the evidence (*Ath. Pol.* xxii.) is against this. At all events, as late as the battle of Marathon the head of the army was the Polemarch (see ARCHON). It follows that the strategus was, until 487 B.C., subordinate to the Polemarch. The tribal unit was represented in the army by the *taxis*, and each *taxis* was led by a strategus. After the Persian Wars the command of the taxis passed to officers called taxiarchs, who acted as colonels under the strategi. If Herodotus may be trusted, the command of the army, at the time of the battle of Marathon, passed to the strategi in turn from day to day. No trace of this system, however, is to be found in the subsequent history. It was the customary practice in the 5th century to appoint a certain number of the generals, usually three or five, for a particular field of operations, and to assign the chief command to one of them. Exceptions to this rule are found in the well-known instances of the Sicilian expedition (when the three commanders, Nicias, Alcibiades and Lamachus were given co-ordinate powers), and of the battle of Arginusae, when the command was divided among the whole board. In crises such as the Samian revolt, the outbreak of the Peloponnesian War or that which led to the recall of Alcibiades, we find the whole board subordinated to a single member (*e.g.* Pericles or Alcibiades). Originally each strategus was elected by and out of the tribe he commanded (*Ath. Pol.* lxi.), and it may probably be inferred from Plutarch (*Cimon*, viii.) that this system prevailed as late as the archonship of Apsephion (469 B.C.). In the 4th century, however, the strategi were elected out of all the citizen body irrespective of tribes; the change must have occurred between 470 and 440 B.C., because in the latter year, and again in 433, one of Pericles' colleagues was Diotimus, a member of his own tribe (cf. Alcibiades and Adeimantus in 408 B.C.). But from Xenophon (*Memorab.* iii. 4) we learn that one strategus was still elected by each tribe, *i.e.* each strategus represented a tribe, though he might not be a member of it. Though the strategi were the nominal heads of the army, it is important to notice that they had no power to choose their taxiarchs, who, like the strategi, were elected by the tribes they were to command. It was only as low as the *lochagi* (commanders of λόχοι, companies) that the Ecclesia allowed them to select. From the *Constitution* (lxi. 3), however, it appears that in the 4th century, at any rate, the *lochagi* were appointed by the taxiarchs, not the strategi. By a gradual process in the course of the 5th century, the regimental command was transferred to the taxiarchs, the strategi thus becoming general officers in command, while they at the same time acquired important political functions (see below). On the other hand the strategi commanded by both land and sea, and thus held the power divided at Sparta between the kings and the nauarchus (admiral).

In the course of the 5th century the powers of the strategia were increased by important political functions, especially in foreign affairs; hence the office, unlike that of the archon (*q.v.*), remained on in its original elective character and was held by the most important men (*e.g.* Pericles, Nicias, Alcibiades). Owing to the fact that the Boulē was the chief administrative body, it was necessary to bring the strategi into close connexion with it; it was, therefore, provided that they, though not members, should be allowed to attend its meetings and to bring motions before it. As the Boulē of one year rarely contained members of the previous Boulē, the strategi acquired great power from the fact that they were frequently re-elected for many years together, and so had greater experience and continuity of policy. Secondly, in the Ecclesia, the strategus had the advantage over the ordinary citizen that his business took precedence (the meetings always discussed first the question of national defence) and that he could in cases of emergency convene a special meeting (cf. Thuc. ii. 59 and iv. 118).

Many historians in dealing with the strategia have been misled by modern analogies. The strategia was, for example, by no means analogous to the British cabinet, which (1) has collective responsibility and (2) is executive in the sense that its members are heads of state departments. The strategi had no such characteristics; their influence over the Ecclesia in voting was merely that of a private citizen; there was no collective responsibility, no unanimous policy. Nor was the strategia a foreign office, though it clearly performed a ministerial act in attaching its signature to treaties. In general it had no powers of originating negotiation, but merely carried out the psephism of the Ecclesia. It was their relation to the empire which gave the strategi their authority. It was they who took the oath on behalf of Athens when an alliance was concluded, and their advice would have special weight in settling the terms of the treaty and the amount of tribute to be paid. They were not, indeed, compelled to submit a budget, nor did an adverse vote by the Ecclesia involve their resignation. On the authority of Plutarch it has been asserted that there was always a president of the strategic college, and this may well have been the case during the Persian Wars (Themistocles, 480; Aristides, 478). The three alleged occasions in the later years of the 5th century when a single strategus was in absolute authority (see above) were all critical occasions and in no way represent the normal condition of affairs. It is abundantly clear that Pericles owed his long ascendancy to his personal force, not to the constitutional authority of his office. Though at first the strategi acted as a single body, in the 4th century and later special duties were assigned to particular members of the board. Thus we hear of strategi ἐπὶ τοὺς ὁπλίτας, ἐπὶ τὴν χώραν, ἐπὶ τὴν ἀκτήν, ἐπὶ τὰς συμμορίας, and inscriptions of the 3rd century refer to others. Under the Roman domination the strategus ἐπὶ τὰ ὅπλα was the chief state officer. The law of the emperor Hadrian regarding the export of oil to Athens speaks of him as managing the corn supply and presiding over the education of the Ephebi. In general, their duty was still mainly the foreign policy, offensive and defensive, of Athens; they nominated trierarchs, and, if any nominee refused to serve, brought him before the Heliaea to defend his case. They had powers of life and death over the army in the field—even a trierarch might be put in irons by a strategus. They presided over certain religious festivals and processions, and appear to have been responsible for the protection of the corn supply.

STRATEGY, a term literally meaning "the art of the leader or general" (Gr. στρατηγός). In the strict sense the word "strategy" was originally introduced into European military literature about the opening of the 18th century, when the practice of warfare had settled down into an established routine, and the need of some term arose which should express that peculiar quality of a general's mind which rendered victory the almost certain consequence of his appearance in the field. As at that period only some small departure from established precedent—a trick or stratagem—could turn the scale between armies of about equal power, the idea of a ruse became connected with the word, and the essential quality in the general's personality which alone rendered ruses practicable, or guaranteed success in their execution, passed out of men's minds, until the gradual disappearance of these methods in the Napoleonic period focused attention again on its essential meaning, *i.e.* the art of the leader. Then the term "strategy" became limited as a technical term to the "practice of the art of war by an executive agent of a supreme government," or in Moltke's words, "the practical adaptation of the means placed at a general's disposal to the attainment of the object in view." This definition fixes the responsibility of a commander-in-chief to the government he serves. He cannot be held answerable for the "means," not even for the training of the "means" for a particular operation, unless he be appointed to his task in adequate time. He is charged with their employment within the limits of the theatre of operations assigned to him. If he considers the means placed at his disposal inadequate he need not accept the position offered him, but he steps beyond his province as a strategist if he attempts to dictate to the government what, in the widest sense, the means supplied to him should be.

Since, however, the "means," *i.e.* the conditions of the problems presented by war, are subject to infinite variation (climate, topography, equipment, arms and men, all being liable to collective or independent change) it is clear that their employment can never be reduced to a "science" but must retain to the full the characteristics of an "art." This distinction is essential, and must be borne in mind, for no soldier can expect to become a Napoleon merely by the study of that great strategist's campaigns. But if he lack practice and experience, and above all genius, the man who neglects such teachings as the contemplation of the works of his predecessors can supply does so at his own peril; and when, as in the case of the soldier, the whole destiny of an empire may depend on his action, he must be bold indeed who would neglect all possible precautions. The cases for study, however, rest on yet broader foundations, for, though theory deduced from history can never, from the nature of things, formulate positive prescriptions, it can at any rate enable the student to throw off the chains of convention and prepare his mind to balance the conflicting claims of the many factors which at every moment clamour for special recognition.

To understand the subject thoroughly it is necessary to follow in some detail the successive stages of human evolution. From the earliest times the defeat of the fighting men of a race has been the most certain road to the acquisition of its wealth, or the trade conditions on which that wealth was based.

To defeat an enemy it was first necessary to march to meet him, and during that march the invaders must either live on the country or carry their own food. If the defender drove off the cattle and burnt the crops, the latter alternative was forced upon them. Thus, since the supplies which could be carried were of necessity small, the defenders had only to create or utilize some passive obstacle for defence which the invaders could not traverse or destroy in the limit of time (fixed by the provisions they carried) at their disposal, to compel the latter to retire to their own country. Every sedentary nation, therefore, had a fixed striking radius which could only be extended by the exercise of ingenuity in the improvement of means of transport, *i.e.* carts and roads. The existence of roads, however, limited the march of an invader to certain directions, and hence it became possible for the defender to concentrate his efforts for their defence on certain points, in fact, to create fortresses, greater or less in proportion to his fear of the enemy and his intelligent appreciation of the degree of sacrifice it was worth while to make to obtain security. A barbarian horde could be stopped by any barrier which could not be set on fire or escaladed without ladders or appliances. Ruses, such as the wooden horse of Troy, then became the fashion, and these had to be met by the cultivation of a higher order of intelligence, which naturally throve best in a crowded community, where each felt his dependence on his neighbour. Thus, for ages, the fort or fortress limited barbarian encroachments, and made possible the growth of civilization in the plains. Ultimately, when the civilized communities grew into contact with one another, developed antagonistic interests, and fell out with one another, intelligence was brought to bear on both sides, and the assailant met fortification with siege-craft. Then the whole cycle worked itself out again. To carry out a siege, men in numbers had to be concentrated and fed whilst concentrated. The stores for attack were also heavy and difficult to convey, hence roads developed increased importance, and troops had to be abstracted from the fighting force to protect them. Thus again a limit of striking radius was fixed for the invader, and in proportion as the dimensions of the invaded country exceeded this radius, and its people made the requisite sacrifices to maintain their fortifications in order, the continued existence and growth of the smaller country was assured. Broadly, this equilibrium of forces remained for generations; the smallest states were eaten up, the larger ones continued to exist side by side with far more powerful enemies, but only on condition of their readiness to make the requisite sacrifice of their personal liberty and the property of their constituent units.

Then came the introduction of gunpowder and of siege artillery, and a fresh readaptation of conditions, which culminated in the Netherlands during the 17th century and forms the starting-point of all modern practice.

Essentially the change consisted in this, viz. that in spite of the superiority of the cannon-ball to the battering-ram, yet to attack a wall effectively many guns had to be employed, and while the duration of the siege was enormously shortened, a far greater strain was thrown on the line of supply, for not only did guns weigh as much as their predecessors but they could expend their own weight of ammunition in a day. Hence the importance of good roads became enhanced and correspondingly the incentive to attack the fortresses which guarded them. In comparison to the money devoted to modern armies, the sums sunk on passive defences during the 16th and 17th centuries were colossal, but they could not keep pace with the progress of the attack, and once more fresh readjustment of means to end became necessary. The obvious course was to carry the war into the enemy's country from the outset, but since this transferred the burden of the siege upon the aggressor, the latter was compelled to develop the standing mercenary army, as feudal levies could not keep the field long enough to reduce a fortress. Mercenary armies, however, were difficult to keep together. They had to be tactfully commanded to ensure contentment, and allowed to maintain social order amongst themselves, and the prospect of loot while on active service had to be held out to them. The sack of a city became thus the absolute and undeniable right of the soldiers. If in this or any other way their employer broke his contract, individuals promptly deserted to the other side. But this right of sack led to a recrudescence of the spirit of resistance in the fortresses (War of Dutch Independence and Thirty Years' War), and hence to a reaction in favour of greater humanity in warfare. But this was only obtained by the concession of a higher scale of pay and comfort to the men, which again threw an increased strain upon the communications, and also upon the treasure chest of their employer.

The growth of the mercenary system, and the facility with which such men could and did change their allegiance, led very rapidly to almost complete uniformity in the composition, training and tactical methods of all armies. Every one knew in advance the degree of effort his adversary proposed to put forward in the next campaign, and made corresponding preparations to meet him. Practically the king desiring to make war submitted his idea to the best-known generals of his day and asked them to tender for its execution. The king, on his side, generally agreed to find the bulk of the labour—his standing army, reinforced by auxiliaries to any desired extent—and as in the case of a modern government contract, the lowest tender was almost invariably accepted, with a pious exhortation to the successful competitor to spare his employer's troops to the best of his ability. Thus the opposing generals took the field, each equally fettered by the conditions of his tender. But two such armies, alike in almost every respect, were far too closely matched to be able easily to gain a decision in the open field. Once they were committed to a battle it was impossible to separate them until sheer physical exhaustion put a stop to the slaughter, and these highly trained men were difficult and expensive to replace. Naturally, then, the generals sought to destroy the existing equilibrium by other means. Primarily they took to strong entrenchments, but the building of these being a matter of time, the communications grew in importance and attempts against them became more serious. One side or the other, consequently, to cover its communications, so extended its front that at length lines stretched right across whole frontiers till their flanks rested on the sea, or on some great fortress or neutral territory. The two armies would then face one another for months, each exhausting every device to induce the other to concentrate on one part of his front whilst an attempt was made by a rapid move to carry a relatively unguarded point elsewhere, *e.g.* Marlborough's surprise of the *Ne plus ultra* lines (see SPANISH SUCCESSION). During such periods of immobility the works grew to the solidity of permanent fortifications, with wide and deep ditches, and with every obstacle known to engineers, whilst to render them defensible by the minimum number of muskets, they were laid out so as to cross their fire over and over again opposite every weak point in their tracing. No amount of battering could alter their general trace, and so they remained defensible as long as their garrisons could be trusted to line the parapets at all. This state of things must have continued until progress in artillery had evolved a weapon with sufficient accuracy and shell power to drive the defenders from their parapets and keep them away till the last moment preceding assault, had not fresh factors evolved themselves from causes at work under totally different topographical limitations and conditions.

First amongst these comes the accession to the throne of Prussia of a king who was commander-in-chief of his own army, and as such responsible to no one for the use he chose to make of it. This would really remove him at once from the category of strategists in the restricted sense in which the term is now employed, but since no convenient word exists to define the action of a ruler playing the double part of soldier and governor, it is convenient both in his case and in that of Napoleon to use the expression to cover the wider sphere. The permanence of the association between king and army enabled Frederick the Great to train his men specifically for the work he intended them to perform. Realizing to the full the value of the foundation laid by his father in developing to its utmost the fire power of the infantry, he devoted special attention to imparting to them a skill and rapidity in manœuvre which ensured that in the open field his generals would always be able to place the muskets at their disposal in the best positions relatively to the enemy; and his cavalry were trained to such a pitch of mobility and precision in drill that they could be relied on to arrive at the appointed time and place to reap the fruits which the infantry fire had sown. To these startling innovations the Austrians had no new ideas to oppose. The old school, the survival of the fittest in the special theatre of its growth, *i.e.* the Netherlands and the Rhine, could not deal with the complete change in topographic surroundings—the far wider area of operations, the comparative scarcity of fortresses and the general practicability of the country for the movement of troops—not trains—off the roads. Frederick, relying absolutely on the intrinsic superiority of his army, knew that if he could catch his enemy in the open victory was a foregone conclusion. If the enemy, in accordance with precedent, fortified a position, a threat to his communications would force him to come out on pain of being surrounded (Pirna 1756, Prague 1757). He followed this principle (see SEVEN YEARS' WAR) until the accession, first of France and the South German states, and afterwards of Russia, to the list of his enemies compelled him to give one enemy time to prepare a position whilst he was engaged against another. Before deliberately prepared positions his men were shot down in thousands, as they would have been in the Netherlands, and at length he was compelled, for want of an adequate artillery, to adopt the same procedure as his adversary. Thus the war ultimately came to an end by a process of mutual exhaustion. But it had brought out conspicuously the value of highly disciplined soldiery, and a fresh fetter was prepared for those on whom, after Frederick's death, the responsibility of command was to fall, and practically all Europe went back to the warfare by contract of the previous generation.

Meanwhile in France events were at work preparing the instrument Napoleon was destined to wield. Contrary to the prevailing opinion amongst modern historians, it is the fact that at no time in history was the art of war, and of all things appertaining to it, more closely studied than during the last years of the old royal army of France. Gribeauval paved the way for the creation of the artillery destined to win for Napoleon his greatest victories, and authors and generals such as the prince de Ligne (*q.v.*), the duc de Broglie, Guibert (*q.v.*), Bosroger, du Teil and many others, pointed out clearly the line reform must take if the existing deadlock between attack and defence was to be removed; but none could suggest the first practical steps to apply, because the existing conditions were too closely interwoven and consolidated. In fact reform was impossible until the dissolution of society itself gave its ultimate particles freedom to combine in more suitable formations. Broadly, however, all were agreed that the protracted and indecisive operations of former wars were economically disastrous. A crushing and decisive victory was the aim for which all should strive; as a first step towards this object decentralization of command was essential, for freedom of manœuvre, the only answer to Frederician methods, was impossible without it. This led to the idea of the permanently organized division of all arms; and events had reached this point when the deluge of the French Revolution overwhelmed them, and in face of a coalition of all Europe it became necessary to build up a new army from the very foundations. The steps by which it was sought to provide the men are dealt with in the article CONSCRIPTION; it is only necessary to point out here that it was not till 1799 that the laws became sufficiently defined to ensure a regular annual increment of recruits, and it was this regularity of supply, and not the fact that compulsion was needed to enforce it, which rendered expedient the complete revolution in warfare which Napoleon was destined to effect.

Until this reform was complete the revolutionary commanders were compelled to make war as best they could under pressure of the law of self-preservation, with the consequence that the whole army became habituated to the fact that orders in the field had to be obeyed at any sacrifice of life and comfort, and that neither hunger nor want of shoes, even of muskets, could be accepted as an excuse for hesitation to advance and to fight. Threatened on all sides, France was at first compelled to guard every avenue of approach by small separate forces taking their instructions only from a central authority in Paris, and thus the "division," a mobile force of all arms, which the earlier reformers had demanded, came spontaneously into existence to meet the requirements of the moment, and, thrown on its own resources, developed the brain and nervous system, *i.e.* the staff, necessary to co-ordinate the action of its limbs.

The next step in evolution came from the obvious advantage which must arise if these units, though starting from different bases, operated towards the attainment of a common purpose. The realization of this ideal, the starting-point of modern strategy, was the creation of Carnot, whose ideas, though far in advance both of contemporary opinion and of the technical means of execution then available (especially in the matter of imperfect means of telegraphy), formed a necessary step in the preparation of the machinery Napoleon was to inherit.

These, therefore, were the materials placed at his disposal when he began to practise the art of the leader: (1) a practically inexhaustible supply of men (the *law* in fact was not passed till two years later, but the *idea* was sufficiently evident); (2) divisional units and commanders, trained to unhesitating obedience to field orders, and accustomed to solve the problems presented to them in their own way, without guidance from superior authority; (3) the idea of co-operation between separate columns for a common purpose; and (4) a tradition that the word "impossible" did not exist for French soldiers.

The equipment of the allies started from very different foundations. To them the individual soldier was a valuable possession, representing an investment of capital generally estimated at £200 cash (as great a strain on the exchequer then as £2,000 would be to-day); and not only was he exposed to the risk of death in action, but he might die of disease or exhaustion on the march, and could always desert if he felt discontented. Moreover, the last campaigns of the Seven Years' War seemed altogether to justify methods of evasion and "strong positions." Frederick the Great, beginning with the most audacious offensive, had ended by copying the caution of his antagonists, and each side had learnt to gauge the fighting value of a single battalion so accurately that to move a force, recognized by both as adequate for its purpose, into a threatening position, sufficed of itself to induce the adversary to accept the situation thus created. Since the value of a fortified position depended largely on the ground, the cult of topography became a mania, and (as Clausewitz puts it) the world lost itself in debating whether "the battalion defended the mountain or the mountain defended the battalion." The care for the comfort of the private soldier was pushed to such a degree that commanders would not report their units fit for action until complete to the last gaiter button and provided in advance with the regulation scale of rations for a fixed number of days. Over-centralization continued; though the expressions "divisions" and "corps" were already known, the idea these words now convey had not yet even come into existence. Though a certain number of units might be assigned to a subordinate commander, they still received all orders, except on the battlefield, from the central authority, and were, moreover, considered interchangeable. There was no personal bond between them and their general. To what lengths this system was pushed, and the consequences which flowed from it, may best be gauged from the fact that in 1805 Mack, when writing his defence for his failure at Ulm (see NAPOLEONIC CAMPAIGNS), thought it quite natural to explain the delay in his movements on the day of Elchingen by the fact that when news of the French attack was received he was busy writing out the orders for the following day, which occupied fourteen pages of foolscap and "did not contain one superfluous word." Further, the idea prevailed in middle Europe that war was a matter concerning the contending governments in which the ordinary citizen had no interest whatever. It was true that the result of a war might transfer his allegiance from one crown to another, but this was scarcely more to the people than a change of landlords. Consequently they took little if any interest in the progress of a war, and on the whole were most inclined to help the army which most respected their private property and was willing to pay highest for its accommodation while billeted in their towns and villages. Since the goodwill of inhabitants is always valuable, commanders vied with one another in their efforts to purchase it, and respect for private property and rights reached an unprecedented level. Thus, during the whole of the campaign of the Netherlands in 1793 the Austrians paid hire to the owners of the fields in which they camped; and when on one occasion payment for lodgings hired for the wounded was in arrear, the wretched men were flung out on the streets. Yet another, and in a way more remarkable, illustration of this tendency occurred at the capture of Mainz by the French (1794). A strong armed party of Austrians, endeavouring to escape across the Rhine to Kastel, were refused the use of the ferry boats until the regular payment was made, and actually laid down their arms to the enemy rather than break the law and seize the boats.

The cumulative influence of all these forces of retardation is easily followed. To avoid the cost of innumerable petty cash transactions with the inhabitants the troops were compelled to have recourse to the magazine system, which in turn tied them absolutely to the main roads; and the roads being numerous the army had to be broken up into small detachments to guard them. Thus the so-called "cordon" system grew out of its surroundings in a perfectly natural way, and was not due to the imbecility of the generals who employed it, but to the restraints placed upon them by custom and public feeling. Nothing more fortunate for the French could be imagined. Destitute of all the paraphernalia hitherto considered necessary, and compelled to fight at any cost in order to live, they found in these accumulated magazines and moving convoys the best possible bait to attract their starving men; relieved of all impedimenta, they could move freely through forests and marshes generally considered impracticable; and since from the magnitude of front covered, and the relatively small number of troops available, the allies could not oppose an unbroken front to their raids, they could swarm around the flanks of the positions and thus compel their evacuation. This struggle to safeguard or turn the flanks of positions led, as before in Marlborough's time and in our own day in Manchuria and South Africa, to a competition in extension, and at Napoleon's advent it was common to find armies of 20,000 to 30,000 men fighting desultory actions over a front of 20 to 30 m. This over-extension gave him his first opportunity, when the fire and energy he threw into his work, and the reckless disregard of human life he immediately displayed, stamped him at once as a born leader of men, and laid the foundation of that confidence in his guidance on the part of his troops which to the last proved his truest talisman of victory.

For the details of Napoleon's evolution the reader is referred to the articles French Revolutionary Wars and Napoleonic Campaigns, and here it will suffice to point out the leading characteristics of those campaigns. Having swept the Austrians out of Sardinia, he turned against them in eastern Lombardy, and by a series of outflanking attacks threw them back into the Alps, defeating all their attempts to break out again by what is now known as a "series of operations on interior lines." All these were successful, not because of the form the operations took, but because the enormous increment of mobility he managed to impart to his men deprived his adversary of all accepted data by which to time his own combinations. It cannot with justice be said that the French won because they fought harder; but the rapid sequence of success confirmed both leader and men in a conviction of their combined superiority which led Napoleon in 1800 to the very brink of disaster. In 1796 throughout he was acting fairly in accordance with the teaching he had imbibed from his studies; in 1800 he appears as if seeking to determine how many of the established rules he could afford to neglect. We find him advancing to meet his adversary on a widely extended front without even exploring the country to learn where or in what strength that adversary stood. In 1805 this mistake is not repeated; a cavalry screen covers his advance, and his orders are based on the intelligence it transmits. But this precaution also proves insufficient. Cavalry can only *see*, they cannot *hold*; and only a combination of circumstances which he could not by any possibility have foreseen prevents his enemy from evading the blow at the last moment. What the position of the French would have been had Mack carried out his intention of leaving Ulm and destroying all his accumulation of supplies can only be imagined. But contemporary evidence proves beyond doubt that Napoleon had already tried the endurance of his men to the utmost.

In 1806 the mistake of sole reliance on a cavalry screen is no longer repeated. The cavalry now is backed by a strong advanced guard, one quarter of the whole army, following behind it at short distance; and the whole command is now disposed in such a manner that no matter in what direction the enemy may appear it can concentrate in forty-eight hours to meet him. It is another form of the idea, prominent in British campaigns in the Sudan, of the advance in squares through the desert against a mobile enemy, the difference being that Napoleon's great "bataillon carrée" has the advantage of mobility over its adversary. Concentration within forty-eight hours, however, would in itself be worse than useless unless the enemy stood fast to receive the intended shock; and it was the special object of the strong advanced guards or flank detachments to secure that he should do so. This could only be attained by a resolute offensive; no mere feeling the enemy's position would suffice to compel him to stand, and might even frighten him into retreat. Hence the task devolving upon the troops thus selected was essentially distinct from that usually connected with the idea of an advanced or flank guard, and involved the conception of purchasing with their lives and by the vigour of their action the time necessary for the rest of the army to deliver a decisive blow.

This is the true meaning of Napoleon's maxim: *On ne manœuvre qu'autour d'un point fixe*, a phrase which has been much misunderstood. The troops first engaged fix the enemy by the vigour of their attack, and thus constitute a pivot about which the remainder can manœuvre.

Hitherto, however, the French armies had been operating in a country in which roughly one square mile of area would feed one thousand men for two days. Their freedom from convoys and other impedimenta enabled them to sweep out an area sufficient for their needs from day to day. But events now led them into a region in which this relation between the day's march and their subsistence no longer obtained. The emperor in fact had formed no conception of the roadlessness and poverty of Poland and East Prussia. His men, no longer able to pick up their day's food by a day's march, rapidly fell off in condition and discipline (for short commons with the French always entailed marauding). As men and horses lost in condition the day's march dwindled further, with the result that heavier demands were made on the supply columns; and these being improvised and entrusted to an untrained personnel, the sufferings of the troops became unendurable, while the mobility of the French army sank below that of the enemy. Under these conditions the system of the advanced guard could no longer be trusted to work. Moreover the Russians, though deficient in the dash necessary to win victories in attack, have always taken longer to defeat than any other continental troops, and in the short winter days of the first half of the Polish campaign the emperor had no longer time to beat them into dissolution. The Russians would fight all day and retreat at night. As they fell back along their communications their feeding was easy. The exhausted French could never overtake them, and the emperor was at length compelled to adopt an expectant attitude. Not before Friedland (June 14, 1807), when the days were long and the country dry and everywhere passable, did his calculations of time and space prove realized and the system justified by the results.

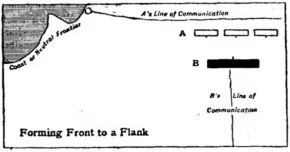
When in 1812 he again attempted to apply it at Vilna and Smolensk the Russians successfully repeated their tactics of evasion on every occasion, until, when they had fallen back to Borodino, their enemy had so far diminished that a battle in a selected position promised reasonable chances of success.

Meanwhile a fresh development in the tactics of the three arms added a new weapon to Napoleon's armoury, rendering the application of his system or any variant of it markedly more certain and efficacious. Whilst the infantry which fought under Napoleon's eagles had been steadily deteriorating, owing to the exorbitant demands his ceaseless marching campaigns had made upon them, the quality of his enemies had been as steadily improving. The growth of the sentiment of nationality had rendered it possible to throw aside the rigidity and impediments of the old conditions. There was no longer any fear that men would desert if called on to bivouac or if rations failed to come up to the accepted standard, and the essential points of the French infantry tactics having been assimilated they developed a relatively higher standard of endurance as measured by time. Means had to be discovered to ensure their destruction before nightfall gave them the opportunity of withdrawal; and the evolution of the artillery arm (see Artillery) at last gave Napoleon the weapon he required to realize the ideal implanted in his mind by his teacher du Teil, vix. *concentration of the destructive elements on the decisive point*, which was derived originally from the analogy between the attack on a fortress and the conduct of a battle. A battle is but an abbreviated siege, or a siege a prolonged battle. In the former the object is to purchase time at the cost of men's lives, in the latter to economize men by expenditure of time; but in both the final step is the same, viz. the creation of a breach of continuity in the enemy's defence through which the assaulting columns can penetrate to the heart of his position. Thanks to the increased mobility in the field artillery and skill in handling it (the result of years of experience), it was now possible, once the aim of the enemy's infantry had been unsteadied, to bring up masses of guns to case-shot range and to breach the living rampart of the defence; and through the gap thus created, infantry or cavalry, or both combined, poured to overwhelm the last reserves beyond. This step completed Napoleon's means of destroying that " independent will power " of his adversary which is after all the greatest variable in the whole problem of war. His advanced guard engaged and fixed his enemy's attention, inducing him prematurely to use up his reserves, and when the battle was " ripe, " to use his own expression, the great blow was delivered with overwhelming suddenness by the balance of fresh troops which he had in hand. But the whole of his action depended essentially on an exact appreciation of the endurance of his own troops first engaged, at the cost of whom the reserves were saved up. It was the possession of this method which rendered Napoleon supreme upon the battlefield and fully justified the reluctance which his enemies showed to hazard its issue; but in the end it also proved the cause of his downfall, for in his fruitless efforts to bring the allies to action in 1813 he so completely wore out his troops that it became physically impossible for them to meet his demands.

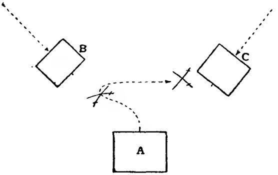
The campaign of 1813 deserves attentive study, for in it Napoleon was both at his best and worst, acting as strategist pure and simple, applying the means at hand to the attainment of the object in view almost without a second thought for the diplomatic relations which so often hampered his military action, notably in 1814. In the famous " defensive campaign " of the latter year, which is usually held up as a model for imitation, he can hardly be said to have acted as a strategist at all, his movements being primarily directed to the destruction of the personal relations existing between the three allied monarchs, not to the annihilation of their respective armies, a task for which from the first he knew his resources to be entirely inadequate. The Waterloo campaign (*q.v.*) again reveals the application of this system in its most finished form. That it failed ultimately was due primarily to atmospheric influences beyond the emperor's control, and in the second place to the introduction of a new tactical method by the British army for which his previous experience had in no way prepared him.

That after the event Napoleon should have sought to justify himself is further proof of the essential duality of his nature, which only rose to intuitive genius in war under the pressure of visible and tangible realities. Relaxed from excitement, he was the creature of his surroundings, controlled by contemporary thought like everyone else; and it is to failure to recognize this duality in his mind that all subsequent confusion in strategical thought owes its origin. It was clear that the career of such a genius could not pass unnoticed by military critics, hence, even while it was still in the making, every student of the military art felt compelled to pass judgment upon its incidents merely to show that he was abreast of the times. More or less, each one tried to show that Napoleon's victories were due to the observance of the critic's own hobbies. These men, brought up on the old military classics, and unaware of the ceaseless current of social changes which was seething around them, instinctively distorted facts to fit in with their preconceived theories. This is always inevitable with regard to contemporary criticism, since distance of time is always needed to bring facts down to their true perspective. It is quite clear from his innumerable reported conversations, and it is quite natural when one considers Napoleon's age, that in the back of his mind he stood rather in awe of these older and often far more deeply-read men. In any case it was quite obvious to him that his military reputation would stand or fall by their collective judgment. Hence, as soon as he had leisure, he set himself to explain his exploits in terms which they could understand. That he would be criticized for his frequent departure from established practice (for instance, in neglecting his communications, and again and again accepting or forcing on a battle in situations in which defeat must have spelt utter ruin) he was well aware. Hence to stifle such criticism in advance he went out of his way to accentuate the care he had devoted to his communications, as in the Marengo campaign, at Ulm, at Austerlitz, and again and again in the campaigns of Wagram and of Dresden. But the truth really is that as long as he adhered to his " bataillon carrée " formation, and the country in which he was operating was fertile enough to support his men, his communications mattered little to him. His certainty of victory, if only the enemy could be induced to stand, was so great that he could fight his way through to where his reinforcements wêre prepared for him, in whatever direction suited him best. Whilst he admitted, as all must do, the sound common sense at the bottom of all rules deduced from centuries of experience, he never raised them to the dignity of inviolable principles, as he did the principle of the fixed point as a pivot for manœuvres, the case-shot attack, and the employment of the *avant-garde générale*. It seems indeed as if these fundamental principles appeared to his mind so self-evident that he assumed them as common knowledge in every intelligent mind, and hence never took the trouble to explain them to his marshals, though he did condescend to allude to them when writing to his brother Jerome and to Eugène de Beauharnais, with the limitations of whose minds he was quite familiar. Marmont, Rogniat, Soult and St Cyr were men for whose intellect he had the highest esteem, and all wrote at length on the subject of his campaigns, yet not an expression in their works, not a manœuvre in their independent commands, can be held to betray a knowledge of what was really the secret of the emperor's successes. For instance, by the year 1812 Marmont may fairly be assumed to have learnt all he ever could learn from Napoleon's example; yet at Salamanca we find him manœuvring quite like one of Frederick's generals. Napoleon would have attacked Wellington with a strong advanced-guard, one-fourth of his command at the least, and whilst the latter was busied in warding off his assailant's successive blows the emperor would have swung the remainder round upon his enemies' flank, and, with a three-to-one superiority at the decisive point, have driven him off the road back to Salamanca. This idea never even entered Marmont's head. Watching Wellington with a screen of vedettes only, he set his whole army in motion to march round his flank, like Frederick at Leuthen. An Austrian army in the old days would usually stand to be surrounded, but Wellington, instead, set his whole force in motion, *i.e.* manœuvred. Again in 1813 (just after frequent conversations with the emperor, in one of which the latter stated his opinion that war was a " science " like any other, and that some day he would write a book out of which any one could learn it), Marmont, in command of the VI. corps, found himself opposed to the Silesian army under Blücher, and immediately took up a defensive position, which he occupied by two lines of brigades deployed in line and écheloned from left to right. No one who had entered into the spirit of the emperor's method could have adopted such a formation. Instances of a similar nature might be multiplied, and their multiplicity need surprise no one who has studied the psychology of action taken under circumstances of intense excitement or imminent danger. Most of us know rules for conduct in all kinds of emergencies, but how often afterwards could anyone describe with accuracy the mental process by which his action in such crises was dictated? Probably never. Intuitively the mind recognizes the right course and fixes upon it, and with the cessation of the emergency finds it impossible to recall the order in which the facts presented themselves to his consciousness. In war these emergencies are constantly arising, so that by degrees the recollection of them becomes blurred, and the chief actor's presentation of them is often the least trustworthy testimony we possess. The act speaks for itself. But where hundreds of thousands of acts are crowded into the short compass of a campaign, a true view of their whole can only be obtained when all have become accessible and time emancipates criticism from partiality. But nations cannot afford to wait until lapse of time renders it safe to publish all diplomatic and other secrets; and many were ready to attempt the solution of the problems of Napoleon's career.

The most prominent were Jomini (*q. v.*), speaking for the French army, and Clausewitz (*q. v.*), for the Prussian. The former, a native of Switzerland, had attracted the attention of Napoleon by the insight his criticisms revealed, and had been attached by him to the staff, where he served under Ney almost continuously from 1806 to 1813. In the latter year there is no doubt that he



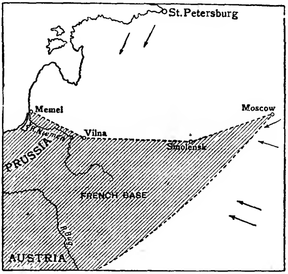
Forming Front to a Flank



did valuable service in the operations culminating with the battle of Bautzen; but, receiving no adequate recognition for them, he deserted to the allies, and was attached by the emperor Alexander, where again he rendered conspicuous service, notably at Leipzig; but his desertion caused him to be viewed with such marked disfavour by all honourable men that he speedily sank into social oblivion, although he remained in the Russian service until his death in 1869. Nevertheless, though he had deserted his cause, he still retained unbounded admiration for the genius of his great master, whose reputation certainly does not suffer at his hands, except for the excess of adulation and bombast with which his historical writings are disfigured. But his social isolation cut him off from authentic eyewitness sources, and he was by nature an inventor of systems. The secret of Napoleon's success he found in the system of " interior lines "—a phrase he invented to designate a method which was almost as old as war itself; and from this system he deduced its opposite, " exterior lines, " and a whole sequence of others, which in the end all resolve themselves into the same idea. A diagram will make the matter clearer than many words. If an army A stands in a central position relatively to two other armies B, C, converging upon it, then, if it moves against each in succession and beats them both, it is said to act on " interior lines "; whilst B and C act on " exterior lines. " What it is said to do when at the first shock B beats it out of existence the books fail to inform us. From this theorem are deduced in succession the advantages and disadvantages of salient and re-entering angles, &c., with which, as a rule, military historians so freely befog their pages.

Since the object of all strategy is to bring the greatest possible force to bear against the decisive point, it is obvious to ask why armies should not always be concentrated, and why they should ever divide. The answer is that a given district and a single road will only subsist a certain number of men, a number which in practice is found to be about 60,000 with their requisite guns and train. Hence an army, say of 120,000 men, not only cannot subsist on a single line or road, but when divided into two equal parts, and separated only by a short day's march, is really more ready for instant action than an army of 90,000 on one road. Separation, therefore, when large numbers are in question, is a necessity of existence, not a matter of free choice; but when it is thus forced upon a commander he regulates the rate of his march so that his separate columns cannot be attacked singly before the heads of both are within supporting distance of one another; the jaws of the crackers then close on the nut, and unless the nut proves harder than the crackers the nut is crushed. But this calculation reposes on an accurate knowledge of the marching powers of the adversary, and it was in this that Napoleon's enemies failed. Accustomed only to their own deliberate methods, they were quite unable to imagine Napoleon's lightning-like rapidity. Marching twenty-five miles in a day, his whole army would hurl itself on one of the columns whilst the other was still too far off to come to its aid, or if they had already approached so close that mutual co-operation was imminent, he would send a detachment against one to purchase time by the sacrifice of its men's lives, and would then strike at the other with the bulk of his forces united. How the detachment executed its task depended chiefly on the nature of the ground. It might fight a series of rear-guard actions if a succession of readily defensible sections favoured such action, or it might conceal its weakness and impose caution and respect on its opponent by the vigour of its attacks; for that there could be no rule, and circumstances alone could decide. In this form Napoleon won most of his earlier successes, but a little reflection will show that the method depended essentially upon his superior mobility and the willingness of his enemy to fight or the reverse. In time this dawned upon his opponents also, and when in 1813 around Dresden he tried to put this plan into force the allied column immediately threatened retreated before him, whilst the other continued its advance, thus compelling him to return to succour his retaining detachment, which, of course, could not struggle on indefinitely against a marked superiority of numbers. He himself confessed during the September days in Dresden that this *jeu de va-et-vient*, as he described it, had completely broken down his army. If, on the other hand, the commander of the central army underestimates his opponent's marching powers its doom is sealed, for both his flanks are turned in advance and he comes under a concentrated fire to which it can only oppose a divergent one. This difference is more marked now than formerly; and stated in its extreme form, for rifle fire only, it really means that every bullet fired from the circumference stands a tenfold better chance of hitting something vulnerable than those directed from the centre towards the circumference. The only salvation for an army thus threatened is to move by a lateral march outside the jaws of the crackers, and fall on one limb only, when, if it is tactically formidable, it stands a good chance of overwhelming the force immediately opposed to it before the others can arrive. For instance, at Königgrätz, if the Austrian main army, pivoting on the fixed point made by their 2nd and 4th corps engaged with Prince Frederick Charles's army, had swung round the remaining six corps upon that of the crown prince by a short march of from six to eight miles, the Elbe army would have struck a blow in the air, and the situation would have been rescued in spite of the slowness and indecision of previous movements. An army standing on interior lines, therefore, occupies a position of advantage or the reverse according to the skill of its leader and its own inherent fighting capacity, and this whether its position arises from operations during the actual course of hostilities, or from circumstances already pre-existent in peace time, as for instance, the configuration of frontiers. The phrase, therefore, "the use of interior lines," though convenient to those who are thoroughly agreed as to its limitations, of itself explains nothing, and is a pitfall for the inexperienced.

A, however, in moving as suggested against his enemy's outer flank, exposes at the same time his own communications with any place lying directly behind his point of departure. If his army suffers only from slowness, but is really superior in fighting power, this risk may be lightly taken—victory settles all things. In proportion, however, as the result of collision is



doubtful, alternative lines of retreat or supply will be advantageous. Hence a broad, if possible a concave or re-entering, base or starting-line is of great importance, and, since as an invader penetrates into his enemy's country his base becomes salient, whilst that of the defender becomes re-entrant, we have here a compensating arrangement which, under given conditions of country, equipment and the like, fixes the striking radius of an aggressor precisely as was the case in former times. The case of the French invasion of Russia in 1812 is an illustration. The Russian base at any moment may be considered as formed by lines traced just outside the striking radius of small bands of French marauders; the French base as including all the territory in their occupation, for within that area they were free to fortify or protect any accumulations of stores and supplies they chose to make. By the time the French reached Moscow the Russians could afford to attack them from any direction, for, whatever happened, retreat into their own undevastated country was always open. The South African war affords a modern example of the same thing.

These ideas are, after all, elementary, and readily grasped even by the average intellect, though many volumes have been devoted to proving them, and yet they are all that Jomini and his followers have to offer us—a fact that both explains and justifies the contempt with which military study was so long regarded by practical soldiers in England.

Clausewitz, however, approached his subject from a higher standpoint. Gifted with a mind of exceptional power, which he had trained to the utmost in the school of German philosophy, and having seen war from the beaten side, he knew well that something more than phrase-making was needed to force a great nation to the final abnegation of its independent will. He stood throughout in the closest connexion with the directing wills which guided the German nation to achieve the final downfall of Napoleon; and he knew that these men were neither bunglers nor fools, but men whose experience well entitled them to the authority they exercised. Hence he reasoned that the catastrophes they had shared in common needed deeper analysis than they had as yet received. First of all he sought a satisfactory definition of what war really meant, and he found the closest analogy to it in the "unrestricted competition of the business world." Had he written in modern times he would doubtless have cast it in the Darwinian mould, viz. "war is the struggle for existence transferred to the national plane," and this is a far more important contribution to sociology and the welfare of humanity, and will certainly exercise much greater influence on the evolution of the nations (on which, after all, the fate of the individual depends) than all the works of Darwin and Herbert Spencer combined. This transference of the question to the national plane is in fact their very antithesis, for whereas the survival of the fittest threatens the stability of society on the principle of the Kilkenny cats, the survival of the race necessitates its coherence. Next, Clausewitz analysed his subject into its constituent factors. In this process he investigates all the theories of bases and geometrical relations, only to discard them as quite inadequate solutions of war's many phenomena; and finally, as between equally armed opponents, he shows that essentially success in war depends on the moral factors only. First is "courage" in all its forms, from its lowest manifestation in the excitement of a charge, to its highest in the fearless acceptance of supreme reponsibility in face of the most imminent personal danger. Next comes "duty," again in its widest sense, from the uncomplaining endurance of the humblest musketeer in the ranks, to the readiness of the whole nation to submit to the sacrifice cf, and the restraint on, personal liberty that readiness for war entails. This "readiness," moreover, he shows to be cardinal (for nations with land frontiers), for indubitably, under the conditions then prevailing, the surest guarantee of victory in the field was the concentration of every man, horse and gun in the shortest time on the decisive point. Thus only could the advantages of greater wealth, larger population and so forth be neutralized; and the growth of modern means of communication, railways, telegraphs, &c., have only confirmed his position. It has been the gradual appreciation of portions of Clausewitz's teaching, enforced by the drastic lessons of 1866 and 1870, which has turned all Europe into an armed camp, and this fact must, for generations, stultify all ideas of European disarmament. For since everything depends on instantaneous readiness for action, it is absurd to expect that any nation will voluntarily consent to throw away the advantages these sacrifices have obtained by agreeing to delay at the very moment when its existence is most gravely threatened. An unready nation has obviously everything to gain from delay.

All this portion of Clausewitz's work is fundamental, and no changes in armament or other conditions can ever affect it; it applies as much to land as to sea power, and essentially was the doctrine of Nelson and St Vincent. Indeed, at sea Nelson was in advance of Napoleon, for he quite understood the advantage to be gained in paralysing the independent will-power of his opponent by a vigorous attack, and was willing to stake his existence upon this principle, notwithstanding the infinitely more uncertain elements of wind and weather which conditioned his movements. But the rest of Clausewitz's teaching is too deeply coloured by his personal experiences, and he stood in too close a relation to the events of his time to be able to focus the details of the whole subject. Although he was the first to seize the meaning of Napoleon's case-shot attack (the description occurs for the first time in his *Campaign of 1815*), he did not realise how this might be applied to the destruction of what he himself formulated as the most serious of all the many indeterminate factors with which a commander is called upon to deal, viz. "the independent will-power of his opponent." He saw clearly enough that time and space were the underlying conditions of all strategical calculation, and that time could be bought at the cost of men's lives; but he did not take the next step forward and show how these calculations must inevitably be upset if the enemy possessed the power of destroying men faster than experience led one to expect. He formulates from his experience that a force of the magnitude of a division, say 10,000 men, can hold an overpowering enemy at bay for about six hours, and an army corps can hardly be destroyed in less than a day; on these data he bases his estimates of the marching area which an army may safely cover. But what if a new and unexpected method of applying "the means at hand to the attainment of the object in view" suddenly wipes out the division in two hours, or the army corps in six? In that case, surely, the independent will-power of the adversary would receive a most unwelcome check. Nor did he ever clearly formulate as a principle the importance of mobility. Every one of course has in a general way understood the advantages of "getting there first," and all of us have for years been familiar with the importance which Napoleon attached to rapid marching. But the tendency has always been to consider the rate of marching in itself as an invariable factor, and to calculate every operation or disposition from the time a column normally takes to deploy into position from a road or defile. But no systematic attempt to determine the advantages which might on occasion be obtained by sacrificing comfort and convenience to the acceleration of a march has ever been undertaken. Yet Napoleon saw and appreciated the point, and it must remain a riddle for all time how such a mind as Clausewitz's, which again and again had seen at first hand the consequences which followed from Napoleon's *marche de manœuvre*—guns and trains upon the roads, infantry and cavalry moving in mass across country—could have failed to place on record the enormous advantages which might follow its adoption. The book as it stood, however, became the bible of the Prussian army, and its comprehension is an indispensable preliminary to all useful study of contemporary practice in war. Moltke's mind, and that of his whole generation, was formed upon it. To its strength the Germans owed all their successes, and to its weaknesses certain grave errors that were almost disasters.

Meanwhile the progress of invention suddenly destroyed the governing condition of all previous experience. The Napoleonic strategy, as we have shown, depended primarily on the certainty of decision conferred on him by his "case-shot attack"; but the introduction of the long-range infantry rifle (muzzle-loader) rendered it practically impossible to bring the masses of artillery to the close ranges required by the Napoleonic method. In the 1859 campaign (see Italian Wars) between France and Austria both sides were handled with such a general absence of intelligence, and the marksmanship of the Austrians in particular was so very inferior, that neither side derived advantage from the change. But when, in 1861–65 (see American Civil War), the theatre of interest was transferred across the Atlantic, the other causes united to give it immense importance. America in the sixties was almost as roadless as East Prussia and Silesia in Frederick the Great's time, and its forests, rivers and marshes were far more impenetrable. Both the Southern and Northern armies, moreover, were entirely new to their work, and consequently their operations became exceedingly slow. As far as the generals and staff had studied war at all they had been brought up to the Napoleonic tradition as handed down by Jomini and his school; and failing as a body to appreciate the intimate interdependence of the three arms, they believed that a resolute crowding on of masses (whether in line or column does not signify) upon the decisive point must suffice to overrun all opposition. But the slowness of operations gave time for entrenchments, and consequently scope for the powers of the new rifle. Whereas against the old musket one rush sufficed to cover the danger zone, the rifle widened this zone about threefold, so that human lungs and limbs could no longer accomplish the distance without pauses, during which pauses, since guns could no longer assist effectively, the attacking infantry had to protect itself by its own fire, standing in the open within point-blank range of the rifles of the cool, skilful and well-covered defenders. Thus when similar experiences had established uniformity of practice in the two contending forces the result was a deadlock, which was ended only by enormous numerical superiority and the "policy of attrition." The lesson, however, passed unnoticed in Europe except in so far as popular attention was caught by the deadliness of the rifle fire, which was attributed, not as it should have been to the peculiar conditions under which it was employed, but to the nature of the weapon itself; and from this conclusion it was a short step to the inference that the breech-loader, firing five rounds to one of the muzzle-loader, must prove a terrible instrument of destruction. Actually this inference has hampered strategic progress ever since.

The campaigns of 1866 in Bohemia, and of 1870 in France, furnish positive proof that Clausewitz had not appreciated the Napoleonic teaching to its full extent, for though the conditions again and again were ideal for its application, no trace of his fundamental principle is distinguishable in Moltke's orders. In the former it would seem from the maps that the Austrians actually possessed the form, though they had forgotten the spirit, as the detached group in Bohemia (see Seven Weeks' War) might well be considered as an *avant-garde générale*, and on the three days preceding Königgrätz, the distribution of the Austrian main army was such that the application of Napoleon's method must have followed had the idea been present. That Moltke himself never contemplated its employment is sufficiently evident from his unfulfilled plan of the 2nd of July, noon, wherein the whole Prussian army was to march across the front of the Austrians in position, precisely as Frederick had done with disastrous results at Kolin a century before.

No campaign, however, demonstrates in more striking manner the fatal consequences of ignoring Napoleon's saying, *On ne manœuvre qu'autour d'une pointe fixe* than 1870. Here was an army enormously superior in numbers and organization, disposing of an admirable cavalry and far superior artillery, repeatedly on the edge of disaster, not because of the superior cunning of their adversary, but simply because the mind of a reasonable man proved quite incapable of conceiving the blunders that his adversary perpetrated. Moltke always placed himself in his enemy's position and decided on what would be the rational course for him to pursue. He gave him the recognized three courses, but it happened that it was always the fourth (the unexpected, because from Moltke's standpoint so hopelessly irrational) that he took. The situations of the 8th, 11th and 16th of August are all instances in point. On the last of these dates (see Franco-German War) the French commander-in-chief by merely standing still through irresolution found himself in a situation promising certain victory. It is true that he took no advantage of it, and nothing can detract from the magnificent resolution of von Alvensleben, commander of the III. Corps, and the gallantry with which his troops and his comrades supported him. But, equally, nothing can alter the fact that in spite of all Bazaine's mistakes the dawn of the 17th of August found the German headquarters with only the débris of two corps on the ground face to face with the whole French army, of which only one-third had been seriously engaged.

Sedan nearly ended in the same way. The Germans had, with their cavalry, fixed to a man the precise position of their enemy, but no troops were told off to hold them, and all throughout the afternoon of the 31st and morning of the 1st the French army was free to issue from the bridge-head of Torcy on a broad front in *masse de manœuvre* and separate the wings of the Prussian army. Judging by the way they actually fought in the hopeless position in which they elected to remain, their prospects of success in the suggested manœuvre were not small. After the war it was easy and natural to place the blame for the situations in the early days on the shoulders of the German cavalry, but closer study of the facts has shown that in spite of all their shortcomings this arm did not deserve it, for they actually found the enemy and reported his positions, while nothing could be urged against them in respect to Sedan, for by that time they had established a relative superiority over their enemy which was absolutely crushing. The truth is that the Prussian staff had not realized that cavalry reports alone, even if they arrive in time (which in fact very few ever did), do not afford a sufficient foundation on which to base a manœuvre. If cavalry, three days' march in advance, report the presence of an enemy at a given spot, the fact affords no certain indication of where they may be even on the following day. It is not enough to find an enemy, he must also be fixed and held so that he cannot move; and the three arms, cavalry, artillery and infantry, form the most efficient combination for economically securing this end.

Twenty years at least elapsed before fresh light came; and then it came from France, not from Germany. No one can accuse the Germans of a tendency to sleep on their laureis; on the contrary, no army in history ever set itself to work with greater zeal and industry to profit by the lessons of its campaigns. But it is not in the ranks of the successful that the defects of the military machine are most surely revealed. Moreover, they were dazzled by the very brilliance of their victories, and gratitude to their leaders made them blind to those leaders' faults. The French started their reforms without these disadvantages. The younger officers, who had seen how splendidly the old imperial army had fought, and the spirit with which it had endured the misery brought upon it by the ineptitude of its leaders, felt no desire to shield the reputation of the latter, while the bitterness of the cup they were compelled to drink filled them with the determination and energy necessary to ensure regeneration. They had been beaten by the palpable neglect of their own Napoleonic traditions, and this fact added additional sting to their sufferings. Accordingly a number of the most zealous amongst them banded themselves together to ensure that the reason for their shame should no longer be forgotten. Presently these men assumed, by sheer weight of merit and industry, the practical control of the military history section of the general staff, and here they trained one another for the posts of instructors at the staff college (École de Guerre), whence ultimately the supply of future commanders would be drawn. As a first step in their progress they ransacked the archives of the War Office and subjected the whole correspondence of Napoleon to a critical investigation, exceeding in thoroughness anything it had as yet undergone. This correspondence is incomplete without comparison with the actual reports on which the letters were based and the executive orders issued, which hitherto had never seen the light. From the juxtaposition of the two a connected system was by degrees evolved. As has been indicated above, Napoleon never really appreciated the enormous intellectual gulf which separated him from his marshals. He habitually treated them as enjoying his own clearness of vision in their work, and it is only in his letters to Jerome and Eugène (with whose limitations he was only too well acquainted, but whom he employed because their interests were identical with his own) that he explains things in a form which even a child might understand. From these indications the whole web of the modern doctrine of the École de Guerre was gradually woven, substantially in the form in which we have given it above. With this work the names of Maillard, Langlois, Bonnal, Foch, Colin, Camon, Desbrière and others deserve to be for ever associated, for they averted intellectual despair in the nation and rendered it possible for the best minds in the country to continue their labours for its regeneration. Without some such basis hope would have been impossible in face of the ever-growing forces of their watchful antagonist. As matters stand, as long as France can keep her ports open to commerce she cannot be overwhelmed by invasion, for it is a question of time and space; and with her existing network of railway communications, which favour her the more the farther the invaders penetrate, the application of this system promises quite astounding possibilities.

All systems, however, must sooner or later be discovered by the adversary, and require, moreover, adaptation to their surroundings, which may vary from the roadlessness of Poland in 1807 or the United States in 1862 to the highly developed networks of communications of all kinds existing nowadays in western Europe; and in each, if the war lasts long enough, a deadlock must eventually come until some readaptation of existing means is discovered which suffices to disturb this equilibrium. Wars, however, nowadays are so short that this condition of deadlock can rarely arise. The side which starts with a pronounced superiority, whether due to more perfect organization, better tactics or the systematic training to some secret such as has been indicated above, will generally gain the lead from the outset and will keep it until its forces no longer suffice for the amount of work to be done. Then we get back to hard fighting pure and simple, in which the iron resolution of the commander ultimately decides the issue of events. But this resolution is not, as is generally supposed, a fixed quantity belonging in equal magnitude to the leader at all times and places, but, is perhaps the most variable quantity of all. A human being can only put out a certain quantity of nervous energy or will-power in a given time, and of two men of equal character that one will succumb first upon whom the necessity for rapid decision is most frequently enforced. This holds good of every man throughout the whole army from highest to lowest. In this case the " art of the leader " will undoubtedly consist in adopting as his course of action that one which can be consistently followed without change of mind. Obviously his best course will be to seize the initiative and keep it up to the final act on the battlefield itself. The commander who is caught in the act of concentration or accepting battle of his own free choice cannot tell from one moment to the other at what point the attack may come or whether indeed it is coming at all, and the strain of expectancy is harder to bear than that of continuous action, and spreads also to every rank in his army. It has been held that as a consequence of the increase of range and rapidity of fire of modern weapons the defence has gained so enormously in power that a commander can accept the risks of a defensive battle with a light heart. This, however, ignores the fact that improved arms will be found in the hands of the assailant also, and every increment of range and rapidity of fire renders it easier to combine the action of many weapons on a single point. Formerly, when bullets barely travelled, with extreme elevation, 1000 yards, and the total artillery train of an army could be numbered in tens, not in hundreds as nowadays, tactical surprise was well-nigh impossible. Troops could always, either by selection of site or clearance around them, ensure that no formidable force could assemble unnoticed within range of their position, while the round shot and the common shell of those days had little power of clearing or levelling solid parapets. Nowadays such selection of site, to say nothing of clearance, is impossible and inconceivable, and once the enemy's mounted men have been compelled to clear the field there is scarcely a limit to the fire power which may be brought into position unnoticed, and thence directed on any chosen point of the enemy's lines. One has but to take the map of Waterloo and its surroundings and consider how it would have facilitated Napoleon's purpose had it been possible for him to prepare the way for his infantry attack by a rain of modern shrapnel and H.E. shells directed from a balloon observatory and coming from every unseen point within a radius of say even 5000 yards. But Napoleon had to wait for several hours till the ground was dry enough to bring up even seventy-two guns to within effective case-shot range. Nowadays he could have switched on his whole two hundred at any moment after daybreak, and his balloon would have told him of the true position of his enemy's reserves. A balloon on the side of the allies could have told them no more than what they already knew, viz. that the whole French army was in front of them; and it is far easier to control and direct fire by observation on the relatively fixed targets which the defence necessarily presents than to do so upon the rapidly moving ones afforded by an assailant. Even where concealment can be practised to the utmost by the defender, and no balloons are available, the power still remains in the hands of the assailant of making any limited area he may choose absolutely untenable; it is only a question of turning on guns enough for the purpose.

But the less time the defender has been allowed in which to improve his position, the more rapidly will a given number of guns achieve the required result; and though we must admit the many difficulties of execution which prevent complete realization of the ideal in practice, yet it is clear that the more closely one can approximate to this ideal, the less the demands which will be made upon the infantry when its turn comes to go forward. This matter is of such importance to the whole subject that we will put it forward in another form. Let us assume that the shells on bursting create only smoke and disturb the dust, delivering no man-killing fragments at all. Still it is clear that, say, 1200 shells a minute bursting over a front of some 600 yards would shroud that front so completely with smoke and dust that its occupants would be quite unable to direct their aim upon the approaching assailants, and under cover of this smoke and dust cloud the latter would be free to carry out what dispositions they might please with the minimum of loss. When finally the shell fire had to be stopped and the smoke lifted, the two infantries would be in presence of one another under conditions which have always been held to offer the maximum guarantee possible to the assailant, viz. an assured numerical superiority disposed in relatively the best positions for the use of their weapons, *i.e.* their fire converging on the point of attack.

From the consequent assault only entrenchments and physically insuperable obstacles (a deep ditch for example) or wire entanglements which require machinery to tear away, can save the defenders. But such obstacles require time for their creation, hence the supreme importance of the utmost possible mobility. Now though in practice every great commander has utilized to the utmost such mobility as he might find in his troops (and by its use he has often, in countries well supplied with roads, succeeded in rendering the erection of entrenchments practically impossible, or in forcing an entrenched enemy to come out and fight in an unprepared position), yet no scientific attempt has hitherto been made to study the whole question of mobility, notwithstanding the fact that the Boer War of 1900–02 proved its importance up to the very hilt. The Boers were wanting in every quality which renders an enemy really formidable except mobility, but because of that supreme qualification and the fact that the enormous area of their country and their exact knowledge of its topography gave them every facility to employ it to the utmost, about nine times their numbers were required to subdue them; and the method ultimately adopted, though freely criticized, was in fact the only one feasible under the circumstances to bring them to a final surrender.

Actually, all systems, the Napoleonic as well as the others, can be defeated finally by an excess of mobility, the exact proportion depending on the topographical nature of the country fought over, the roads available and its extent. So great is its influence that it overrides all changes in armament or in tactics, as was shown in Manchuria in 1904–05, where in spite of both armies, or perhaps better *because* both armies were trained on western European lines, the actual form which the war assumed was that of Marlborough's times. It is sufficient to imagine the Japanese supplied with sufficient pioneer battalions, of the type employed on the Indian frontier, and a first-rate transport corps (which would have doubled their average rate of daily progress), to see how completely the situation would have been altered. They could have reached Mukden in half the time actually required, and would then have possessed a numerical superiority sufficient to ensure for them a second Metz or even a Sedan. It is in this direction that all great progress is to be looked for, but it involves experiment and organization beyond the capacity of any single student. We may, however, indicate the general outline such a development would require. Primarily time is chiefly lost in the hesitation of leaders and in the preparation and circulation of orders. A clear apprehension of the powers which modern weapons confer on the attack will lead to the elimination of the first, and a higher intellectual training of the whole army will materially reduce the second, for the limit to the brevity of orders is fixed by the trained intelligence of the recipients. Napoleon's marshals could move effectively in response to an order of a couple of sentences; Mack's generals needed fourteen sheets of foolscap.

Next comes the rapidity of movement of the troops themselves when on the road. They cannot march for longer hours than already at times they are called upon to do; but by a better distribution of the weights carried between the men and their transport, they might well cover much more ground in the same time. Here again determination to take the offensive, and to keep it, largely governs the situation. An army determined to attack needs no entrenching gear, certainly not on its men. Its fire is its best protection, and when as in recent campaigns in Bulgaria and the Far East the need for entrenchments has arisen, that has only occurred because the whole weapon of attack, viz. that combination of the three arms which we call an army, was not properly balanced in its parts at those particular moments so as to enable it to maintain its forward impulse. Either, as in Bulgaria, the staff was not up to its duties, or, as in the case of the Japanese, the artillery arm was too slow, or was locally outclassed by the artillery power of its adversary. But in all countries, roadless ones in particular, the progress of the front is conditioned by the efficiency of the transport services in rear, and only because this branch of the army has never received all the attention it deserves has it been necessary to overload the men and horses at the front in the preposterous manner which custom has everywhere sanctioned, which for the most part has been inherited from the time of Marlborough. Over and over again in the past two centuries men have shown that literally only muskets and ammunition are required to win battles, and that a great victory won by rapid marching is by far the most economical use that can be made of human powers. But again and again the pendulum has swung back, and the soldier, in order to be prepared for emergencies which only defeat can bring about, has been burdened down by a weight which has brought him on the field too late and too weary to win it, but in ample time to incur all the penalties of disaster.

In the future in western Europe that army whose transport service, based on motor vehicles and a good road maintenance corps of real working men, will relieve the soldier and his horse (where he has one) of every ounce of superfluous weight, including even in that expression greatcoats and all rounds of ammunition in excess of 120 apiece, and whose men are uniformly trained to the Bersaglieri march (7 m. in one hour or 15 m. in three consecutive hours), will possess a superiority over its adversary which he will require twofold odds to counteract. The suggestion that the ammunition supply should be limited may create surprise, but it is a logical consequence, and precisely one of those points on which the strategist of the future will require a firm conviction. The fundamental fact on which all tactical practice is based is this, that a relatively small loss suddenly inflicted exercises a far greater demoralizing effect upon its recipient than a much heavier punishment extended over a longer period. First-rate troops have often broken back in disorder under a sudden hail of bullets which has swept away not more than 2 to 3% of their strength, whilst exactly similar battalions in the same action have held out all day and remained an efficient fighting body after even 30% had fallen. But, armament being equal, this sudden loss can only be inflicted by placing the troops on the field in the best position possible, relatively to their enemy to derive the full benefit of their fire-power; and mobility is the chief factor in attaining this end. The point is most clearly seen in the case of the action of a well-mounted force against a slow-moving convoy; the convoy forms a target which men can hardly miss; the assailants are a number of dots it is scarcely possible to hit. Two thousand rounds per man of the escort would scarcely suffice to obtain the same results as twenty rounds a man on the side of the assailants. This is a clear illustration of the principle involved, which should always be kept in mind.

Lastly the student should master the elementary principles of railway transportation. The progress since railways were last used in warfare in western Europe has been so enormous that the data supplied therefrom are entirely antiquated, and there is no indication that any general staff in Europe is alive to the possibilities they present in defence. As already pointed out, the assailant cannot count on their aid once he has penetrated within the enemy's country, and the farther he advances the worse matters become for him. It is enough to consider an invading force based on the east coast of Yorkshire with its head about Leeds; the technical excellence of English railways is so great that 120,000 men with all their share of guns and necessary equipment could be easily transferred say from Glasgow and Edinburgh round to Sheffield in twenty-four hours for a flank attack. Even double that number, from the south of England to the north of Yorkshire, could be moved in the same time. It is not suggested that such movements might be in themselves desirable, but only that in face of such mobility of masses, no calculation of the enemy's movements would be possible.

In conclusion, the man who would fit himself for the highest commands in war, or even for the criticism of those who exercise them, must never for one moment forget that the momentary spirit of the mass he directs is the fundamental condition of the success of every movement. Just as there is no movement so simple that its success may not be jeopardized by ill-will and despondency in execution, there is hardly any limit to what willing men can achieve, and it has been this power of evoking in their commands the spirit of blind trust and confidence that places men like Cromwell, Marlborough, Frederick and Napoleon almost beyond reproach. By the side of this power the technical knowledge and ingenuity displayed in their several undertakings appear quite trivial; probably the same ideas have occurred to thousands of quite mediocre men, but were never put into execution, because they could not count on the whole-souled devotion of their men to execute them. This power is born in a man, not acquired, but even those who possess it in embryo can increase and develop it enormously by a systematic study of the laws which govern the action of humanity in the mass.

From the above we arrive at the following definitions for the terms most generally employed by writers on military history and strategy.

Base.—The point, or line joining a series of points, from whence military operations originate. Ultimately military operations have their inception in an area, *i.e.* a whole country from which organization draws men, arms, food and material of all descriptions, forwarding them through a network of communications—roads, railways, canals, rivers, &c., and delivering them at points as near to the proposed enemy as circumstances render expedient. As an army never has too many men, and normal civil transport is cheaper in every way than military, the tendency is always to maintain the collection of men and materials under civil administration as long as possible. Thus as an army moves forward, settling the district behind it as it advances, the civil administration follows after it, only ceasing to exercise its functions when these can be no longer carried out without military protection. Generally there is a zone in which civil transport and supply exist side by side with military precautions greater or less, but for all practical purposes each column, whatever its strength, has its "base" at that point where the existing magazines are filled by civilian contractors in the ordinary course of trade, and with no extra charge for war risks.

Line of Communication.—The line of communication is the great main road, trunk railway, canal or river, or any combination of these means, for the transport of stores leading from the base to the army at the front. Along these arteries of communication depots are established, military authority commands, and every arrangement is made that foresight can suggest to meet the abnormal demands that a condition of war naturally gives rise to. Napoleon always used the words *route de l'armée,* which conveyed perhaps a clearer idea of the conditions the road or other means of communication had to comply with than the current term. In proportion to the numbers which have to be supplied by this line of communication its importance naturally increases. Thus whereas in 1870 the Germans on the Loire had a choice of magnificent main roads, even of canals and railroads, and if one were temporarily interrupted could switch off the current of supply to another without great inconvenience, the Russians in 1904 were tied to a single railway, any interruption of which must have paralysed altogether their vast army which ultimately numbered 400,000 mouths to be fed. It is clear, therefore, that the importance attaching to the protection of the line of communications must vary in accordance with the nature of the country in which war is carried on, the state of its communications of all sorts, the facility for establishing new ones, and the number of men depending for subsistence on any single road, railway, river or canal.

Line of Operations is a term applied to an imaginary line drawn from the centre of gravity of the army at the front to the country from which it originates. Whereas lines of communication, being dependent on the topographical conformation of the district may be highly circuitous; the line of operations is merely a general direction more convenient to keep in mind than the more complex idea embodied in the former word. Since practically all supply flows to an army along its line or lines of communication, and without them it can only exist for a limited period, practically all situations that can arise in war can be referred to their possible consequences in endangering more or less either one's own communications or those of the enemy. An army is thus said to "form front to a flank" when its communications run parallel to the direction it assumes when facing the enemy (see diagram). It is clear that in case of a defeat at or near *A* the communications are most gravely endangered, hence no commander voluntarily assumes such a position unless he is absolutely confident in the power of his troops to beat the enemy and by so doing places his antagonist in even a worse position in case of defeat. This he can only do by placing himself more or less astride his adversaries' communications, when the latter if beaten is ruined beyond retrieval. Thus in the Marengo campaign, in 1800, Napoleon, in placing himself astride the Austrian communications, was himself compelled to form front to a flank, but this was only possible because the geographical relation of the French and Italian frontiers enabled him from the outset of the campaign to aim a blow in the rear of his opponents' actual front. Under modern conditions such situations in war between two great land powers can hardly arise. The preliminary concentration of armies is arranged in peace in such a manner that both armies will always start with their communications perpendicularly behind them. Hence though the advantage which can be gained by defeating an army when forming front to a flank is equally great, it cannot be attained except by accepting a corresponding risk, and the same holds good if one army places itself astride the communications of another, *e.g.* the Germans at Gravelotte. But when a land army has to deal with a great sea power controlling the vast mercantile navies of the present day, the latter being free to land wherever he pleases can compel his adversary to form front to a flank almost as he pleases. This was the advantage Wellington derived from sea power in the campaign of Vittoria (see PENINSULAR WAR), and there are many theatres of war in which the operation might be repeated nowadays, for though armies have grown tenfold in numbers the means of carrying them with certainty and speed have increased in a yet greater ratio. As between land powers the question may be complicated when the frontier is formed by some great natural obstacle, a great river or range of mountains. There can be an almost infinite range of gradation between the imaginary line marked across a plain by boundary pillars, and the hard and fast distinction drawn between sea and land. The advantage, however, always lies on the side of the nation that possesses behind such barrier the better means of lateral communications. Those on land can never be so good as the sea, but in proportion as they approach that ideal their possessor can transfer masses of men in complete security and comparative secrecy, to whichever portion of the frontier may suit his purpose best.

Exterior Lines.—When armies operate from several bases by lines converging on an army centrally situated as regards them, they are said to operate on exterior lines, and conversely the army operating from a centre against armies converging upon it is said to be acting on "interior lines." The question of the relative superiority of the one form or the other has been discussed above. It is only necessary to point out here that the question again is one of mobility in its widest sense, *i.e.* the mobility resulting from better communications both of intelligence, orders and the actual material forces by which war is made. Owing to the configuration of frontiers, it may be absolutely necessary to attack on exterior lines, but once the convergence these imply has been attained, and a victory won, the advantage of the form, which is derived from the superiority of communications at the disposal of the nation acting from the broader base, passes over to the defender, who destroying all railways, &c. in his retreat, compels the assailant to advance by route marching only, whereas as he, the defender, falls back within his own territory, he preserves unimpeded control over his own railways, and can thus transfer troops from one flank of the assailant to another, as the case may require.

Obstacles.—All obstacles, whether formed by rivers, marshes, forests or mountains, are of value in strategy only in so far as they delay the rapidity of communications by limiting the number of the available means of transport, whether roads or railways, and whatever angle they may form with the line of operations of the contending forces the advantage they offer falls entirely to the side that commands the exits of the defiles by which they are traversed on the farther side. When neither side commands such exits from the outset, the advantage falls to the side which can accumulate first at the desired point of passage a sufficient fire superiority to cover his subsequent necessary operations; in the case of a river, the building of one or several bridges; in the case of a mountain range, the deployment of his advance-guard. In the former case there is no particular reason why the facilities of communication should be greater on one bank than the other. In the latter the side which has to traverse the mountains (marsh or forest) will always be at a disadvantage for the actual attack, but at an advantage in regard to the secrecy with which he can fall upon the point of his own choice, and the more secure his telegraph lines, the greater will this advantage be. (F. N. M.)

STRATFORD, JOHN DE (d. 1348), archbishop of Canterbury, was born at Stratford-on-Avon and educated at Merton College, Oxford, afterwards entering the service of Edward II. He served as archdeacon of Lincoln, canon of York and dean of the court of arches before 1323, when he became bishop of Winchester, an appointment which was made during his visit to Pope John XXII. at Avignon and which was very much disliked by Edward II. In 1327 the bishop joined Queen Isabella's partisans; he drew up the six articles against Edward II., and was one of those who visited the captive king at Kenilworth to urge him to abdicate in favour of his son. Under Edward III. he became a member of the royal council, but his high political importance dates from the autumn of 1330, the time when Roger Mortimer lost his power. In November of this year Stratford became chancellor, and for the next ten years he was actively engaged in public business, being the king's most prominent adviser and being politically, says Stubbs, the "head of the Lancastrian or constitutional party." In 1333 he was appointed archbishop of Canterbury and he resigned the chancellorship in the following year; however, he held this office again from 1335 to 1337 and for about two months in 1340. In November 1340 Edward III., humiliated, impecunious and angry, returned suddenly to England from Flanders and vented his wrath upon the archbishop's brother, the chancellor, Robert de Stratford. Fearing arrest John de Stratford fled to Canterbury, and entered upon a violent war of words with the king, and by his firm conduct led to the establishment of the principle that peers were only to be tried in full parliament before their own order (*en pleyn parlement et devant les piers*). But good relations were soon restored between the two, and the archbishop acted as president of the council during Edward's absence from England in 1345 and 1346, although he never regained his former position of influence. His concluding years were mainly spent in the discharge of his spiritual duties, and he died at Mayfield in Sussex on the 23rd of August 1348.

John's brother, Robert de Stratford, was also one of Edward III.'s principal ministers. He served for a time as deputy to his brother, and in 1337 became chancellor and bishop of Chichester; he lost the former office in 1340 and died on the 9th of April 1362.

Ralph de Stratford, bishop of London from 1340 until his death at Stepney on the 7th of April 1354, was a member of the same family. All three prelates were benefactors to Stratford-on-Avon.

STRATFORD, a city and port of entry of Ontario, Canada, and capital of Perth county, situated 83 m. W.S.W. of Toronto by the Grand Trunk railway, on the Avon river. Pop. (1901), 9959. The repair and engineering shops of the railway, flour-, saw- and woollen-mills, engine and agricultural implement works are the principal industries. A large export trade in cheese and other dairy and farm produce is carried on.

STRATFORD DE REDCLIFFE, STRATFORD CANNING, VISCOUNT (1786–1880), British diplomatist, was born in Clement's Lane in the city of London, on the 4th of November 1786. His father, Stratford Canning, uncle of George Canning (*q.v.*), had been disinherited for his marriage with Mehetabel Patrick. He settled in London as a merchant. On his death, six months after the birth of his son, his widow took a house at Wanstead near Epping Forest. Stratford Canning was educated first at a dame's school at Wanstead, then at Hackney, and after 1794 at Eton. In 1805 he was elected a scholar of King's College, Cambridge, but he only kept two terms, and in 1807 was appointed précis writer to the foreign office by his cousin George Canning. He received his degree in 1812, residence having been dispensed with on the ground that he was absent on the king's service. In 1807 he went as secretary to Mr Merry on a diplomatic mission to Copenhagen. In 1808 he was appointed first secretary to Mr (afterwards Sir Robert) Adair, who was sent as ambassador to Constantinople. When Mr Adair was transferred to Vienna in 1810, Canning remained at Constantinople as *chargé d'affaires*. The British government was then in the very crisis of its struggle with Napoleon, and it left Canning entirely to his own discretion. His principal task was to persuade the Turkish government not to show undue favour to the French privateers which swarmed in the Levant. In May 1812 he was able to play the part of "honest broker" in arranging the peace of Bucharest between Turkey and Russia, which left a powerful Russian army free to take part in repelling Napoleon's invasion. Canning was able to hasten the decision of the Turks, by making judicious use of Napoleon's plan for the partition of their empire. A copy of it had been left in his hands by Mr Adair to be used at the proper moment. In July he left Constantinople with the sincere desire never to return, for he was tired of the corrupt and stiff-necked Turkish officials. His ambition was to lead an active career at home. But his success in arranging the treaty of Bucharest had marked him out for diplomatic employment. His absence from home in early youth and the independent position he had held much before the usual age, had in fact disqualified him for the career of a parliamentary party man. By the friendly intervention of Castlereagh, his cousin's old opponent, he received a pension, or rather a retaining fee, of £1200 a year, on the "usual conditions"—which were that he should bind himself to accept the next diplomatic post offered, and should not attempt to enter parliament. Canning spent his leisure in travelling about England, and he wrote some poetry which gained him the praise of Byron, whom he had known in boyhood, and had met in Constantinople. In 1814 he was appointed minister plenipotentiary to Switzerland. In this capacity he had a share in reorganizing the confederacy after the fall of the Napoleonic settlement, and he attended the congress at Vienna. He was an eye-witness of the dramatic change produced at Vienna by Napoleon's return from Elba. Canning retained his post in Switzerland till 1818. In 1816 he married Miss Harriet Raikes, daughter of a governor of the Bank of England. Her death in child-birth in 1818, had a strong influence in inducing him to resign his post, of which he was thoroughly tired. The British minister to Switzerland had merely formal duties to perform in normal times, and the place was wearisome to a man of Canning's capacity and desire for work. In 1819 he was appointed minister at Washington, a station of great difficulty owing to the ill-feeling created by the war of 1812 and the many delicate questions outstanding between the British and the American governments. Canning, whose naturally quick temper had been developed by early independence, came into occasional collision with John Quincy Adams, the American secretary of state, who was, on his own showing, by no means of a patient disposition. Yet the American statesman recognized that the "arrogance" of the British minister was combined with absolute candour and that he was above all petty diplomatic trickery. They parted with mutual respect. Canning returned to England in 1823 on leave and did not go back to Washington. The general treaty he had arranged with Mr Adams was rejected by the United States Senate.

In 1824 Canning was selected as ambassador to Turkey, and proceeded to Constantinople after a preliminary visit to Vienna and St Petersburg. In the Russian capital he was engaged in discussing the arrangement of the Alaska boundary, and partly in sounding the Russian government as to the course to be taken with the Greek revolt against Turkey. He left for Constantinople in October 1825, accompanied by his second wife, the daughter of Mr Alexander of Somerhill near Tonbridge. At Constantinople he was engaged with the ambassadors of France and Russia in an enterprise which he afterwards recognized as having been hopeless from the beginning—namely in endeavouring to induce Sultan Mahmud II. to make concessions to the Greeks, without applying to him the pressure of armed force. After the battle of Navarino (*q.v.*) on the 20th of October 1827, the ambassadors were compelled to retire to Corfu. Here Canning learned that his conduct so far had been approved, but as he desired to know what view was taken of the final rupture with the Porte he came home. He was sent out again on the 8th of July 1828. Canning did not agree on all points with his superior, Lord Aberdeen, and in 1829 he, for the time being, turned from diplomatic to parliamentary life. He sat for Old Sarum, for Stockbridge (rotten boroughs) and for Southampton, but did not make much mark in parliament. He was twice absent on diplomatic missions. At the end of 1831 he went to Constantinople to attend the conferences on the delimitation of the Greek frontier, arriving immediately after the receipt of the news of Mehemet Ali's invasion of Syria (see MEHEMET ALI). Sultan Mahmud now proposed to Canning an alliance between Great Britain and Turkey, and Canning strongly urged this upon Palmerston, pointing out the advisability of helping the sultan against Mehemet Ali in order to forestall Russia, and of at the same time placating Mehemet Ali by guaranteeing him certain advantages. This advice, which largely anticipated the settlement of 1841, was not followed; but Canning himself was in high favour with the sultan, from whom he received the unique distinction of the sovereign's portrait set in diamonds. In 1833 he was selected as ambassador to Russia, but the tsar Nicholas I. refused to receive him. The story that the tsar was influenced by merely personal animosity seems to be unfounded. Nicholas was no doubt sufficiently informed as to the peremptory character of Sir Stratford Canning (he had been made G.C.B. in 1828) to see his unfitness to represent Great Britain at a really independent court.

After Canning had declined the treasurership of the Household and the governor-generalship of Canada, he was again named ambassador at Constantinople. He reached his post in January 1842 and retained it till his resignation in February 1858. His tenure of office in these years was made remarkable—first by his constant efforts to induce the Turkish government to accept reform and to conduct itself with humanity and decency; then by the Crimean War (*q.v.*). Canning had no original liking for the Turks. He was the first to express an ardent hope that they would be expelled from Europe with "bag and baggage"—a phrase made popular in after times by Gladstone. But he had persuaded himself that under the new sultan Abd-ul-Mejid they might be reformed, and he was willing to play the part of guiding providence. He certainly impressed himself on the Turks, and on all other witnesses, as a strong personality. In particular he struck the imagination of Kinglake, the author of the *Invasion of the Crimea*. In that book he appears as a kind of magician who is always mentioned as the "great Elchi" and who influences the fate of nations by mystic spells cast on pallid sultans. Great Elchi is the Turkish title for an ambassador, and Elchi for a minister plenipotentiary. The use made of the exotic title in Kinglake's book is only one of the Corinthian ornaments of his style. In sober fact Canning's exertions on behalf of reform in Turkey affected little below the surface. His share in the Crimean War cannot be told here. On the fall of Palmerston's ministry in February 1858 he resigned, and though he paid a complimentary farewell visit to Constantinople, he had no further share in public life than the occasional speeches he delivered from his place in the House of Lords. He had been raised to the peerage in 1852. During his later years he wrote several essays collected under the title of *The Eastern Question* (London, 1881). In 1873 he published his treatise, *Why I am a Christian*, and in 1876 his play, *Alfred the Great at Athelney*. The only son of his second marriage died before him. His wife and two daughters survived him. Lord Stratford died on the 14th of August 1880, and was buried at Frant in Sussex. A monument to him was erected in Westminster Abbey in 1884.

See *Life of Lord Stratford de Redcliffe*, by S. Lane Poole (London, 1888).

STRATFORD-ON-AVON, a market town and municipal borough in the Stratford-on-Avon parliamentary division of Warwickshire, England; on a branch line of the Great Western railway and on the East & West Junction railway, in connexion with which it is served from London by the Great Central ($92\frac{1}{2}$ m.) and the London & North-Western railways. Pop. (1901), 8310. The town lies mainly on the right (west) bank of the Avon. The neighbourhood, comprised in the rich valley of the Avon, is beautiful though of no considerable elevation. The river flows in exquisite wooded reaches, navigable only for small boats. The Stratford-on-Avon canal communicates with the Warwick and Birmingham canal. The river is crossed at Stratford by a stone bridge of 14 arches, built by Sir Hugh Clopton in the reign of Henry VII. The church of the Holy Trinity occupies the site of a Saxon monastery, which existed before 691, when the bishop of Worcester received it in exchange from Ethelred, king of Mercia. It is beautifully placed near the river, and is a fine cruciform structure, partly Early English and partly Perpendicular, with a central tower and lofty octagonal spire. It was greatly improved in the reign of Edward III. by John de Stratford, who rebuilt the south aisle. He also in 1332 founded a chantry for priests, and in 1351 Ralph de Stratford built for John's chantry priests "a house of square stone," which came to be known as the college, and in connexion with which the church became collegiate. The present beautiful choir was built by Dean Balshall (1465–1491), and in the reign of Henry VII. the north and south transepts were erected. A window commemorates the Shakespearian scholar J. O. Halliwell-Phillipps. The foundation of the chapel of the gild of the Holy Cross was laid by Robert de Stratford. The gild, to which both sexes were admitted, was in existence early in the 13th century, and it was incorporated by a charter from Edward III. in 1322. It was dissolved in 1547. The guildhall is a picturesque half-timbered building. A beautiful house of the 16th century belonged to one Thomas Rogers, whose daughter was mother of John Harvard, the founder of Harvard College, U.S.A. Among public buildings are the town hall, originally dated 1633, rebuilt 1767, and altered 1863; market house, corn exchange and three hospitals. There are recreation grounds. Brewing is carried on, but the trade is principally agricultural. Area, 4013 acres.

Shakespearian Connexion.—To no town has the memory of one famous son brought wider notoriety than that which the memory of William Shakespeare has brought to Stratford; yet this notoriety sprang into strong growth only towards the end of the 18th century. The task of preserving for modern eyes the buildings which Shakespeare himself saw was not entered upon until much of the visible connexion with his times had been destroyed. Yet the town is under no great industrial or other modernizing influence, and therefore stands in the position of an ancient shrine, drawing a pilgrimage of modern origin. The plan of Shakespeare's Stratford at least is preserved, for the road crossing Clopton's bridge is an ancient highway, and forks in the midst of the town into three great branches, about which the village grew up. The high cross no longer stands at the market-place where these roads converged. But the open space where is now a memorial fountain was the Rother market, and Rother Street preserves its name. The word signifies horned cattle, and is found in Shakespeare's own writing, in the restored line "It is the pasture lards the rother's sides" (*Timon of Athens*), where "brother's" was originally the accredited reading. In Henley Street, close by, is the house in which the poet was born, greatly altered in external appearance, being actually two half-timbered cottages connected. A small apartment is by immemorial tradition shown as his birth-room, bearing on its white-washed walls and its windows innumerable signatures of visitors, among which such names as Walter Scott, Dickens and Thackeray may be deciphered. Part of the building, used by the poet's father as a wool-shop, is fitted as a museum. Shakespeare may have attended the grammar school attached to the old guildhall in Church Street. This was a foundation in connexion with the gild of the Holy Cross, but was refounded after the dissolution by King Edward VI. in 1553, and bears his name. The site of Shakespeare's house, New Place, bought by him in 1597, was acquired by public subscription, chiefly through the exertions of J. O. Halliwell-Phillipps, and was handed over to the trustees of the birthplace in 1876. The house was built by Sir Hugh Clopton. Shakespeare acquired a considerable property adjacent to it, retired here after his active life in London, and here died. Sir John Clopton destroyed the house in 1702 (as it had reverted to his family), and the mansion he built was in turn destroyed by Sir Francis Gastrell in 1759. The site, which is traceable, is surrounded by gardens. Shakespeare is buried in the chancel of Holy Trinity church, his wife lying next to him. The slab over the poet's grave bears the lines beginning

"Good friend, for Jesus' sake forbeare
To digg the dust enclosed heare";

while the effigy on the mural monument above may well be an authentic representation, though somewhat altered and damaged by time and restoration (see SHAKESPEARE: *Portraits*).

Apart from the interest attaching to the pleasant country town and its pastoral environment, through their influence traceable in Shakespeare's writings, there are further connexions with himself and his family to be found. The house adjacent to New Place known as Nash's house was that of Thomas Nash, who married Shakespeare's granddaughter Elizabeth Hall; it is used as a museum. At Shottery, 1 m. west of Stratford, is the picturesque thatched cottage in which Shakespeare's wife, Anne Hathaway, was born. It was purchased for the nation in 1892. The maiden name of the poet's mother was Mary Arden, and this name, that of an ancient county family, survives in the district north-west of Stratford, the Forest of Arden, though the true forest character is long lost. At Snitterfield to the north, where the low wooded hills begin to rise from the valley, lived Shakespeare's grandfather and uncle.

The principal modern monument to the poet's memory in Stratford is the Shakespeare Memorial, a semi-Gothic building of brick, stone and timber, erected in 1877 to contain a theatre, picture gallery and library. A performance of one of the plays is given annually. The memorial stands by the river above the church, and above again lie the Bancroft or Bank croft gardens where, in 1769, a celebration in honour of the poet was organized by David Garrick. Evidence of the intense interest taken by American visitors in Stratford is seen in the memorial fountain and clock-tower presented in 1887, and in a window in the church illustrating scenes from the Incarnation and containing figures from English and American history.

History.—Stratford-on-Avon (*Stradforde*, *Strafford*, *Strafford-on-Avon*) is a place of great antiquity. A Roman road may have run past the site; coins, &c., have been found, and the district at any rate was inhabited in Roman times. The manor was granted by King Offa to the bishopric of Worcester; and it was under the protection of the bishops of Worcester, who were granting them privileges as early as the reign of Richard I., that the inhabitants of the town assumed burghal rights at an early date. The Gild of the Holy Cross, founded in the 13th century for the support of poor priests and others, exercised great authority over the town for many years. Its dissolution was the cause of the incorporation charter of Edward VI. in 1553, by which the town was incorporated under the title of the bailiff and burgesses, who were to bear the name of aldermen. Another charter, confirming former liberties but altering the constitution of the corporation, was granted in 1611. By the charters of 1664 and 1674 the corporation was given the title of mayor, aldermen and burgesses. The governing body now consists of a mayor, 6 aldermen and 18 councillors. A market, formerly held on Thursdays by a grant of 1309, is now held on Fridays. The various trades of weaving, saddlery, glove-making, collar-making, candle-making and soap-making were carried on during the 16th, 17th and 18th centuries, but have lost their importance.

STRATHAVEN (locally pronounced *Strĕvn*), a manufacturing and market town of Lanarkshire, Scotland. Pop. (1901), 4076. It lies on the Avon, 16 m. S.S.E. of Glasgow by road, and is the terminus of the Caledonian Railway Company's branch line from Hamilton. It has manufactures of silk, cotton and hosiery and is a market for cheese and grain. The picturesque ruins of Avondale Castle are situated on Powmilion Burn, a stream that runs through Strathaven to join the Avon, a mile below the town. Remains of a Roman road are traceable for several miles immediately to the south of the Avon. Stonehouse (pop. 2961), a mining and weaving town about 4 m. north-west, is claimed as the birthplace of the Scottish martyr, Patrick Hamilton (1504–1528). Six miles south-west of Strathaven, on the moor of Drumclog, the Covenanters defeated John Graham of Claverhouse, Viscount Dundee, on the 1st of June 1679. A granite obelisk commemorates the battle, but the religious meetings that used to take place on the anniversary are no longer held.

STRATHCLYDE, the name given in the 9th and 10th centuries to the British (Welsh) kingdom, which from the 7th century onwards was probably confined to the basin of the Clyde, together with the adjacent coast districts, Ayrshire, &c., on the west of Scotland. Its capital was Dumbarton (fortress of the Britons), then known as Alclyde. On the south this kingdom bordered on the territories of the Niduari Picts of Galloway, including the modern counties of Wigtown and Kirkcudbright, a region which from the middle of the 7th century seems to have been in the possession of the Northumbrians. Strathclyde is also sometimes called Cumbria, or Cumberland, and the survival of the latter name on the English side of the border preserves the memory of a period when the territories of the northern Welsh were of much greater extent, though it is perhaps not certain that the race possessed political unity at that time. Of the origin of the kingdom of the North Britons we have no information, but there seems little reason to doubt that they were the dominant people in southern Scotland before the Roman invasion.

After the withdrawal of the Romans in the 5th century the northern Britons seem to have shown greater determination in maintaining their independence than any of the southern kingdoms and, according to Welsh tradition, Cunedda, the ancestor of the kings of Gwynedd, had himself come from the north. In the *Historia brittonum* we read of several princes of the northern Britons. The chief of these appear to have been Urien, who is said to have fought against the Northumbrian king Theodoric, and Rhydderch Hen who is mentioned also in Adamnan's Life of S. Columba. Rhydderch Hen appears to have secured the supremacy amongst these Welsh princes after the great battle of Ardderyd fought about the year 573, to which frequent reference is made in early Welsh poetry. His death seems to have taken place in 603. A late authority states that he was succeeded by his son Constantine, but the subsequent kings were descended from another branch of the same family.

Such notices as we have of the history of Strathclyde in the 7th and 8th centuries are preserved only in the chronicles of the surrounding nations and even these supply us with little more than an incomplete record of wars with the neighbouring Scots, Picts and Northumbrians. It is probable that the Britons were allied with the Scots when Aidan, the king of the latter, invaded Northumbria in A.D. 597. In 642, however, we find the two Celtic peoples at war with one another, for in that year the Britons under their king Owen defeated and slew the Scottish king Domnall Breac. In the same year they came into conflict with the Northumbrian king Oswio. In 649 there appears to have been a battle between the Britons and the Picts, but about this time the former must have become subject to the Northumbrian kingdom. They recovered their independence, however, after the defeat of Ecgfrith by the Picts in 685. In 711 and again in 717 we hear of further wars between the Britons and the Scots of Dalriada, the former being defeated in both years. Towards the middle of the 8th century Strathclyde was again threatened by an alliance between the Northumbrians and Picts, and in 750 the Northumbrian king Eadberht wrested from them a considerable part of their territories in the west including Kyle in Ayrshire. In 756 the North Britons are said to have been forced into submission and from this time onwards we hear very little of their history, though occasional references to the deaths of their kings show that the kingdom still continued to exist.

In 870 Dumbarton was attacked and destroyed after four months' siege by the Scandinavian king Ivarr, and for some time after this the country was exposed to ravages by the Norsemen. It is believed that the native dynasty came to an end early in the 10th century and that the subsequent kings belonged to a branch of the Scottish royal family. At the end of the reign of Edward the Elder (925) the Britons of Strathclyde submitted to that king together with all the other princes of the north.

In the reign of his successor Æthelstan, however, they joined with the Scots and Norwegians in attempts to overthrow the English supremacy, attempts which were ended by their defeat at the battle of Brunanburh in 937. In 945–46 Strathclyde was ravaged by King Edmund and given over to the Scottish king Malcolm I. The fall of the kingdom was only temporary, for we hear of a defeat of the Scottish king Cuilean by the Britons in 971. In the 11th century Strathclyde appears to have been finally incorporated in the Scottish kingdom, and the last time we hear of one of its kings is at the battle of Carham in 1018 when the British king Owen fought in alliance with Malcolm II.

The following is a list of kings whose names are mentioned in the chronicles:—

Rhydderch Hen	d. 603
Constantine son of Rhydderch (?)	—
Iudruis (?)	d. 633
Owain (Eugein)	d. 642
Gwraid (Gureit)	d. 658
Dyfnwal (Domhnall), son of Owain	d. 694
Beli, son of Elphin	d. 722
Tewdwr (Teudubr), son of Beli	d. 750
Dyfnwal (Dannagual), son of Tewdwr	d. 760
Cynan, son of Ruadrach	d. 816
Artgha	d. 872
Run, son of Artgha	d. before 878 (?)
Dyfnwal (Donevaldus)	d. 908
Dyfnwal (Donevaldus), son of Ede (Aedh) Owain	d. 934
Dyfnwal (Domhnall), son of Eoghain (on pilgrimage)	d. 975
Malcolm, son of Dyfnwal	d. 997
Owain (Eugenius)	1018

See *Chronicles of the Picts and Scots*, edited by W. F. Skene (Edinburgh, 1867); W. F. Skene, *Celtic Scotland* (Edinburgh, 1876); and Sir John Rhys, *Celtic Britain* (London, 1904).

(F. G. M. B.)

STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, BARON (1820–), Canadian statesman and financier, was born at Forres, Scotland, on the 6th of August 1820, the second son of Alexander Smith (d. 1850), a Highland merchant. His mother, Barbara Stewart, of Abernethy, was the sister of John Stewart (d. 1847), a famous fur trader in the Canadian North-West, who gave his name to Stewart Lake and Stewart river. Through him Donald Smith was appointed in 1838 a junior clerk in the Hudson's Bay Company, which at that time controlled the greater part of what is now the Dominion of Canada. Smith was sent to Labrador, and stationed at Hamilton Inlet. For thirteen years he roughed it there, mastering the work of the fur trade, introducing various improvements into the conditions of life, being the first to prove that potatoes and other vegetables could be grown with success on that bleak coast, and varying his business routine with much reading and letter-writing. Then he was for ten years on Hudson Bay, rising in the company's service to be a chief trader and then a chief factor. In 1868 he was appointed to the post of resident governor, with headquarters at Montreal. In the next year Louis Riel's (*q.v.*) rebellion broke out on the Red river, caused chiefly by the transfer of territorial rights from the company to the Dominion of Canada, and in December Smith was sent by the Canadian government with wide powers as special commissioner to endeavour to check the rebellion, and to report "on the best mode of quieting and removing such discontent and dissatisfaction." On arriving at Fort Garry (now Winnipeg) he advised the government that it would be necessary to send troops; in the meanwhile he kept cool in face of a very ugly situation, and it was largely owing to his tact and diplomacy that the lives of the numerous prisoners were saved, that Riel's position was gradually undermined and that the relief expedition under Colonel (afterwards Lord) Wolseley had no fighting to do. Apart from the rebellion, there was difficulty with the company's traders. The company's control over the North-West was to be surrendered to Canada for £300,000, certain grants of lands and certain trading privileges, and the traders on the spot feared that in the distribution of the money their rights might not be guarded, but Smith succeeded in persuading them to trust him to secure their share, and asserted their claims so effectually that £107,000 was paid to them. During these complications in the North-West he occupied for a time the position of acting governor: in December 1870, on the first election to the legislative assembly of the new province of Manitoba, he was returned for Winnipeg; and in March 1871, after a very bitter contest, he was elected as one of the four Manitoba representatives to the Dominion House of Commons, as member for Selkirk. The reorganization of the Hudson's Bay Company in 1871—involving the loss of its administrative functions and its restriction to questions of trade only—made it necessary to appoint a chief commissioner for the North-West, and in 1871 Smith received the appointment when in London, after his championship of the claims of the local traders. At Ottawa he at once became the spokesman of the new territories, though for a time subject to the suspicion of those who thought that the company had done too little to assist the Canadian government against Riel, and he was frequently attacked in parliament and out of it on various charges. In 1872 he became one of the original members of the first North-West council under the act providing for the government of the territories by the lieutenant-governor of Manitoba and a council of eleven.

It was at this time that the construction of the Canadian Pacific railway became a practical question. The terms of the entrance of British Columbia into the Dominion in 1871 included a stipulation for the immediate beginning of a railway from the Pacific towards the Rocky Mountains, and from a point to be selected east of the Rockies towards the Pacific; this line, connecting the Pacific seaboard with eastern Canada, was to be completed within ten years from the date of union. After a controversy on the merits of private or government construction, in 1872 a charter was given by Sir John Macdonald's government to a company, with Sir Hugh Allan at its head, for the construction of the line, with a subsidy in land grants and money, but in 1873 disclosures of corrupt practices in relation to this charter (the so-called Pacific Scandal) led to the fall of the government, and the company was soon afterwards dissolved. In the great debate which ended in the resignation of the government, one of the chief causes of its downfall was a moderate but powerful speech by Smith, which led to a temporary estrangement between him and Macdonald. The Liberal government which came into power early in 1874 reverted, though timidly, to the policy of government ownership.

Meanwhile Donald Smith, together with his cousin Mr George Stephen (afterwards Lord Mountstephen), and other Canadian and American financiers, had bought out the Dutch bondholders of the insolvent St Paul & Pacific railway, an American line, which by 1873 had been completed from St Paul to Breckenridge, but which lacked funds to proceed farther. After long negotiations the new owners persuaded the government of Manitoba to build a line from Winnipeg to Pembina on the American frontier. This done, in 1879 the partners formed the St Paul, Minneapolis & Manitoba Railway Company, and by continuing the line from Breckenridge to Pembina united Manitoba with the south and west.

In 1878 the Liberal party was defeated, and Sir John Macdonald returned to office with the support of Smith, who had been driven to rejoin the Conservatives by the over-cautious railway policy of the Liberals. In 1880 the new government made a contract for building the railway with a syndicate of which Stephen was the chief director, and in which Smith, from the first largely interested, came more and more to the front. Both were prominent directors of the Bank of Montreal, and employed its resources in the work without hesitation. Smith also embarked in the work the whole of his private fortune, and it was his dogged perseverance which more than anything else enabled the company to bring its work to a successful conclusion. The contract allowed ten years for the completion of the line, but such energy was shown that on the 7th of November 1885, at Craigellachie in the Rocky Mountains, Donald Smith drove home the last spike of the first Canadian transcontinental railway. In 1882 he left parliament, but returned to it in 1887, and represented Montreal West till 1896, when he was appointed to succeed Sir Charles Tupper in London as high commissioner for Canada. In that year he was made G.C.M.G.; in 1897 he was raised to the peerage and in 1909 made G.C.V.O. In 1889 he became governor of the Hudson's Bay

Company. On the 21st of March 1896 he was appointed government commissioner to Manitoba and the Territories to endeavour to lessen the bitterness in the discussion as to Roman Catholic rights in the public schools, and the compromise of 1897 followed the lines which he suggested (see CANADA).

In January 1900, during the war in South Africa, he raised, equipped and presented to the British government a regiment of irregular cavalry 600 strong. Strathcona's Horse, as it was called, was recruited in the Canadian West, and did good service during the war. Though this was perhaps the most striking of the many services which his great wealth enabled him to do for Canada and the British Empire, he left no side of Canadian life untouched. With his cousin, Lord Mountstephen, he founded and endowed the Royal Victoria Hospital in Montreal, and both in Canada and in Scotland gave largely and wisely to university work. He was the backbone of the emigration policy which from 1896 on did much to increase the population and the prosperity of Canada. He helped in the improvement of the waterways of the Canadian West, and in placing steamers on them, and gave much assistance to the proposed All Red Route of British-owned steamers, encircling the world. From the first he was a member of the Pacific Cable Board, controlling the cable laid in 1902 by the combined governments of Great Britain, Canada and Australia. No man did more to tighten the ties which bind Canada to the British Empire.

The *Life* by Beckles Willson contains some useful information. The Histories of the Hudson's Bay Company by Beckles Willson, Rev. George Bryce and Miss Agnes C. Laut tell his early struggles. *Sir Wilfrid Laurier* (2 vols.), by J. S. Willison, describes the financial dealings between the Canadian government and the Canadian Pacific railway. His parliamentary speeches are in the Canadian *Hansard*. (W. L. G.)

STRATHNAIRN, HUGH HENRY ROSE, 1st BARON (1801–1885), British field-marshal, third son of the Right Hon. Sir George Henry Rose of Sandhills, Christchurch, Hampshire (minister plenipotentiary at the Prussian court), was born at Berlin on the 6th of April 1801. He was educated at Berlin, and received military instruction at the cadet school. He entered the 93rd Sutherland Highlanders as an ensign on the 8th of June 1820, but was transferred to the 19th Foot, then quartered in Ireland, and took part in preserving order during the "Ribbon" outrages. He was promoted rapidly, to a lieutenancy in 1821, a captaincy in 1824, and an unattached majority at the end of 1826. He was brought into the 92nd Highlanders as a regimental major in 1829, and the following year was appointed equerry to H.R.H. the duke of Cambridge. The 92nd Highlanders were in Ireland, and Rose again found himself employed in maintaining law and order. He rendered important services in suppressing disaffected meetings, but his conduct was so courteous to the ringleaders that he incurred no personal hostility. In 1833 he accompanied his regiment to Gibraltar, and three years later to Malta, where he exerted himself with so much zeal during a serious outbreak of cholera in attending to the sick soldiers that his conduct elicited an official approval from the governor and commander-in-chief. In 1839 he was promoted, by purchase, to an unattached lieutenant-colonelcy. In the following year Rose was selected, with other officers and detachments of Royal Artillery and Royal Engineers, for special service in Syria under the orders of the foreign office. They were to co-operate on shore, under Brigadier-General Michell, R.A.—in conjunction with the Turkish troops—with the British fleet on the coast, for the expulsion of Mehemet Ali's Egyptian army from Syria. Sir Stratford Canning sent Rose from Constantinople on a diplomatic mission to Ibrahim Pasha, commanding the Egyptian army in Syria, and after its execution he was attached, as deputy adjutant-general, to the staff of Omar Pasha, who landed at Jaffa with a large Turkish force from the British fleet. Rose distinguished himself in several engagements, and was twice wounded at El Mesden in January 1841. He was mentioned in despatches, and received from the sultan the order of Nishan Iftihar in diamonds, the war medal and a sabre of honour. The king of Prussia sent him the order of St John, and expressed his pleasure that "an early acquaintance" had so gallantly distinguished himself. Shortly after he succeeded to the command of the British detachment in Syria with the local rank of colonel, and in April 1841 he was appointed British consul-general for Syria. For seven years, amidst political complications and intrigues, Rose, by his energy and force of character, did much to arrest the horrors of civil war, to prevent the feuds between the Maronites and Druses coming to a head, and to administer justice impartially. On one occasion in 1841, when he found the Maronites and Druses drawn up in two lines and firing at each other, he rode between them at imminent risk to his life, and by the sheer force of a stronger will stopped the conflict. In the first year of his appointment his action saved the lives of several hundred Christians at Deir el Khama, in the Lebanon, and his services were warmly recognized by Lord Aberdeen in the House of Lords, and he was made C.B. In 1845, by his promptness and energy, at great personal risk, he rescued 600 Christians belonging to the American mission at Abaye, in the Lebanon, from the hands of the Druses, and brought them to Beirut. In 1848, during the outbreak of cholera at Beirut, he was most devoted in his attention to the sick and dying.

At the end of this year he left Syria on leave of absence, and did not return, as Lord Palmerston appointed him secretary of embassy at Constantinople in January 1851. In the following year he was chargé d'affaires in the absence of Sir Stratford Canning during the crisis of the question of the "holy places," and he so strengthened the hands of the Porte by his determined action that the Russian attempt to force a secret treaty upon Turkey was foiled. During the war with Russia in 1854–56 Rose was the British commissioner at the headquarters of the French army, with the local rank of brigadier-general. At Varna he succeeded in quenching a fire which threatened the French small-arm ammunition stores, and received the thanks of Marshal St Arnaud, who recommended him for the Legion of Honour. He was present at the battle of the Alma, and was wounded on the following day. At Inkerman he reconnoitred the ground between the British and French armies with great *sang-froid* under a withering fire from the Russian pickets, and his horse was shot under him. He distinguished himself on several other occasions in maintaining verbal communication between the allied forces, and by his tact and judgment contributed to the good feeling that existed between the two armies. His services were brought to notice by the commanders-in-chief of both armies, and he received the medal with three clasps and the thanks of parliament, was promoted to be major-general, and was made K.C.B. and commander of the Legion of Honour. On the outbreak of the Indian Mutiny in 1857 Rose was given command of the Poona division. He arrived in September, and shortly after took command of the Central India force. In January 1858 he marched from Mhow, captured Rathgarh after a short siege, and defeated the raja of Banpur near Barodia in the same month. He then relieved Saugor, captured Garhakota and the fort of Barodia, and early in March defeated the rebels in the Madanpur Pass and captured Madanpur and Chanderi. He arrived before Jhansi on the 20th of March, and during its investment defeated a relieving force under Tantia Topi at the Betwa on the 1st of April. Most of Rose's force was locked up in the investment, and to Tantia Topi's army of 20,000 he could only oppose 1500 men; yet with this small force he routed the enemy with a loss of 1500 men and all their stores. Jhansi was stormed and the greater part of the city taken on the 3rd, and the rest the following day, and the fort occupied on the 5th. Kunch was captured, after severe fighting in a temperature of 110° in the shade, on the 7th of May. Rose himself was only able to hold out by medical treatment, and many casualties occurred from the great heat. Under the same conditions the march was made on Kalpi. The rebels came out in multitudes on the 22nd of May to attack his small force, exhausted by hard marching and weakened by sickness, but after a severe fight under a burning sun, and in a suffocating hot wind, were utterly routed and Kalpi occupied the following day. Having completed his programme, Rose obtained sick leave, and Sir Robert Napier (*q.v.*) was appointed to succeed him, when news came of the defection of Sindhia's troops and the occupation of Gwalior by Tantia Topi. Rose at once resumed command and moved on Gwalior by forced marches, and on the 16th of June won the battle of Morar. Leaving Napier there, he attacked Gwalior on the 19th, when the city was captured. The fortress was stormed and won the following day, and Napier gained a signal victory over the flying enemy at Jaora-Alipur on the 22nd. Rose then made over the command to Napier and returned to Poona. It was to Rose's military genius that the suppression of the Indian Mutiny was largely due; but owing to official jealousy his outstanding merit was not fully recognized at the time. For his services he received the medal with clasp, the thanks of both houses of parliament, the regimental colonelcy of the 45th Foot, and was created G.C.B. By a legal quibble the Central India force, after protracted litigation, was not allowed its share of prize-money, a loss to Rose of £30,000. Rose was promoted lieutenant-general for his "eminent services" in February 1860, and the next month was appointed commander-in-chief of the Bombay army, and on the departure of Lord Clyde from India in the following June he succeeded him as commander-in-chief in India. During his tenure of the command-in-chief Rose improved the discipline of the army, while his powerful assistance enabled the changes consequent upon the amalgamation of the East India Company's army with the Queen's army to be carried out without friction. He was created K.C.S.I. in 1861 and G.C.S.I. on the enlargement of the order. On his return home he was made an honorary D.C.L. of Oxford University.

Rose held the Irish command from 1865 until 1870, was raised to the peerage in 1866 as Baron Strathnairn of Strathnairn and Jhansi, transferred to the colonelcy of the 92nd Foot, and appointed president of the army transport committee. By a good organization and disposition of the troops under his command in 1866 and 1867 he enabled the Irish government to deal successfully with the Fenian conspiracy. He was promoted general in 1867. On relinquishing the Irish command he was made an honorary LL.D. of Trinity College, Dublin. For the rest of his days he lived generally in London. He was gazetted to the colonelcy of the Royal Horse Guards in 1869, and promoted to be field marshal in June 1877. He died in Paris on the 16th of October 1885, and was buried with military honours in the graveyard of the Priory Church, Christchurch, Hampshire. An equestrian bronze statue, by E. Onslow Ford, R.A., was erected to his memory at Knightsbridge, London. He was never married.

See Sir Owen Tudor Burne, *Clyde and Strathnairn*, "Rulers of India Series" (1891). (R. H. V.)

STRATHPEFFER, a village and spa of the county of Ross and Cromarty, Scotland, 5 m. W. of Dingwall by a branch of the Highland railway. Pop. (1901), 354. It lies in a valley of varying elevation (200 to 400 ft. above the sea), but is sheltered on the west and north and has a comparatively dry and warm climate. There are several sulphurous springs—one saline, another strongly impregnated with sulphuretted hydrogen—in great repute for gout, rheumatism, skin diseases and affections of the liver and kidneys. The well of effervescent chalybeate water is largely resorted to for anaemia and as a tonic. A peat bath, similar to those at Franzensbad in Bohemia, has also been established. The season runs from May to October, and during the past few years Strathpeffer has become a very popular resort. The pump-room (1829) and pavilion (1881) are situated in the middle of the village. Castle Leod (pron. *Loud*), a seat of the countess of Cromartie, upon whose property Strathpeffer is built, lies a mile to the north and is an example of the Scots Baronial style dating from 1660. The village was the scene of the fight between the Mackenzies and Macdonalds in 1478, and later between the Mackenzies and the Munros. The Mackenzies prevailed in both encounters. The ascent of Ben Wyvis (3429 ft.) is commonly made from Strathpeffer.

STRAUBING, a town of Germany, in the kingdom of Bavaria, pleasantly situated in a fertile plain, on the right bank of the Danube, here crossed by two bridges, 25 m. S.E. of Regensburg, on the railway to Passau. Pop. (1905), 20,856, nearly all of whom are Roman Catholics. Its oldest and most characteristic building is the tall square tower with its five pointed turrets, dating from 1208. It has eight Roman Catholic churches. among them being the church of St James, a handsome Late Gothic edifice, with some paintings ascribed to Wohlgemuth; the old Carmelite church containing a monument to Duke Albert II. of Bavaria; and that of St Peter with the tomb of Agnes Bernauer. It has also a Gothic town-hall, a castle, now used as barracks, and two fine squares. The numerous educational establishments include a gymnasium, an episcopal seminary for boys and a normal school. The industries of Straubing are tanning and brewing, the manufacture of bricks and cement, and trade in grain and cattle. Straubing is a town of remote origin, believed to be identical with the Roman station of *Sorbiodurum*. In definite history, however, it is known only as a Bavarian town, and from 1353 to 1425 it was the seat of the ducal line of Bavaria-Straubing. Its chief historical interest attaches to its connexion with the unfortunate Agnes Bernauer (*q.v.*), who lived at the château here with her husband Duke Albert III.

See Wimmer, *Sammelblätter zur Geschichte der Stadt Straubing* (Straubing, 1882–1884), and Ortner, *Straubing in seiner Vergangenheit und Gegenwart* (Straubing, 1902).

STRAUS, LUDWIG (1835–1899), Austrian violinist, was born at Pressburg on the 28th of March 1835. He studied at the Vienna Conservatorium from 1843 to 1848, as a pupil of Böhm; made his first appearance in 1850, and five years afterwards made a tour in Italy; in 1857 he became acquainted with his lifelong friend, the 'cellist Piatti, and toured with him in Germany and Sweden. From 1860 to 1864 he was concert-meister at Frankfort, and during these years he visited England frequently, in the year 1864 taking up his residence there. He was for many years leader of Hallé's orchestra in Manchester, and a familiar figure at the Popular Concerts in London. He was first violin in the Queen's Band. He retired, owing to ill health, in 1893, and from that time till his death, on the 23rd of October 1899, lived at Cambridge. His playing, whether of violin or viola, had very great qualities; he was perfect in ensemble, and his power of self-effacement was of a piece with his gentle disposition and with the pure love of art which distinguished him through life. A more lovable nature never existed, and his quiet influence on the art of his time was very great.

STRAUSS, DAVID FRIEDRICH (1808–1874), German theologian and man of letters, was born at Ludwigsburg, near Stuttgart, on the 27th of January 1808. In his thirteenth year he was sent to the evangelical seminary at Blaubeuren, near Ulm, to be prepared for the study of theology. Amongst the principal masters in the school were Professors Kern and F. C. Baur, who infused into their pupils above all a deep love of the ancient classics. In 1825 Strauss passed from school to the university of Tübingen. The professors of philosophy there failed to interest him, but he was strongly attracted by the writings of Schleiermacher, which awoke his keen dialectical faculty and delivered him from the vagueness and exaggerations of romantic and somnambulistic mysticism. In 1830 he became assistant to a country clergyman, and nine months later accepted the post of professor in the high school at Maulbronn, having to teach Latin, history and Hebrew. In October 1831 he resigned his office in order to study under Schleiermacher and Hegel in Berlin. Hegel died just as he arrived, and, though he regularly attended Schleiermacher's lectures, it was only those on the life of Jesus which exercised a very powerful influence upon him. It was amongst the followers of Hegel that he found kindred spirits. Under the leading of Hegel's distinction, between *Vorstellung* and *Begriff*, he had already conceived the idea of his two principal theological works—the *Leben Jesu* and the *Christliche Dogmatik*. In 1832 he returned to Tübingen and became repetent in the university, lecturing on logic, history of philosophy, Plato, and history of ethics, with great success. But in the autumn of 1833 he resigned this position in order to devote all his time to the completion of his projected

Leben Jesu (1835). The work produced an immense sensation and created a new epoch in the treatment of the rise of Christianity. In 1837 Strauss replied to his critics (*Streitschriften zur Verteidigung meiner Schrift über das Leben Jesu*). In the third edition of the work (1839), and in *Zwei friedliche Blätter*, he made important concessions to his critics, which he withdrew, however, in the fourth edition (1840; translated into English by George Eliot, with Latin preface by Strauss, 1846). In 1840 and the following year he published his *Christliche Glaubenslehre* (2 vols.), the principle of which is that the history of Christian doctrines is their disintegration. Between the publication of this work and that of the *Friedliche Blätter* he had been elected to a chair of theology in the university of Zürich. But the appointment provoked such a storm of popular ill will in the canton that the authorities considered it wise to pension him before he entered upon his duties, although this concession came too late to save the government. With his *Glaubenslehre* he took leave of theology for upwards of twenty years. In August 1841 he married Agnes Schebest, a cultivated and beautiful opera singer of high repute, but not adapted to be the wife of a scholar and literary man like Strauss. Five years afterwards, when two children had been born, a separation by arrangement was made. Strauss resumed his literary activity by the publication of *Der Romantiker auf dem Thron der Cäsaren*, in which he drew a satirical parallel between Julian the Apostate and Frederick William IV. of Prussia (1847). In 1848 he was nominated as member of the Frankfort parliament, but was defeated. He was elected for the Württemberg chamber, but his action was so conservative that his constituents requested him to resign his seat. He forgot his political disappointments in the production of a series of biographical works, which secured for him a permanent place in German literature (*Schubarts Leben*, 2 vols., 1849; *Christian Märklin*, 1851; *Nikodemus Frischlin*, 1855; *Ulrich von Hutten*, 3 vols., 1858–1860, 6th ed. 1895; *H. S. Reimarus*, 1862). With this last-named work he returned to theology, and two years afterwards (1864) published his *Leben Jesu für das deutsche Volk* (13th ed., 1904). It failed to produce an effect comparable with that of the first *Life*, but the replies to it were many, and Strauss answered them in his pamphlet *Die Halben und die Ganzen* (1865), directed specially against Schenkel and Hengstenberg. His *Christus des Glaubens und der Jesus der Geschichte* (1865) is a severe criticism of Schleiermacher's lectures on the life of Jesus, which were then first published. From 1865 to 1872 Strauss resided in Darmstadt, and in 1870 published his lectures on *Voltaire* (9th ed., 1907). His last work, *Der alte und der neue Glaube* (1872; 16th ed., 1904; English translation by M. Blind, 1873), produced almost as great a sensation as his *Life of Jesus*, and not least amongst Strauss's own friends, who wondered at his one-sided view of Christianity and his professed abandonment of spiritual philosophy for the materialism of modern science. To the fourth edition of the book he added a *Nachwort als Vorwort* (1873). The same year symptoms of a fatal malady appeared, and death followed on the 8th of February 1874.

Strauss's mind was almost exclusively analytical and critical, without depth of religious feeling or philosophical penetration, or historical sympathy; his work was accordingly rarely constructive. His *Life of Jesus* was directed against not only the traditional orthodox view of the Gospel narratives, but likewise the rationalistic treatment of them, whether after the manner of Reimarus or that of Paulus. The mythical theory that the Christ of the Gospels, excepting the most meagre outline of personal history, was the unintentional creation of the early Christian Messianic expectation he applied with merciless rigour to the narratives. But his operations were based upon fatal defects, positive and negative. He held a narrow theory as to the miraculous, a still narrower as to the relation of the divine to the human, and he had no true idea of the nature of historical tradition, while, as F. C. Baur complained, his critique of the Gospel history had not been preceded by the essential preliminary critique of the Gospels themselves.

AUTHORITIES.—Strauss's works were published in a collected edition in 12 vols., by E. Zeller (1876–1878), without his *Christliche Dogmatik*. His *Ausgewählte Briefe* appeared in 1895. On his life and works, see E. Zeller, *David Friedrich Strauss in seinem Leben und seinen Schriften* (1874); A. Hausrath, *D. F. Strauss und die Theologie seiner Zeit* (2 vols., 1876–1878); F. J. Vischer, *Kritische Gänge* (1844), vol. i., and by the same writer, *Altes und Neues* (1882), vol. iii.; R. Gottschall, *Literarische Charakterköpfe* (1896), vol. iv.; S. Eck, *D. F. Strauss* (1899); K. Harraeus, *D. F. Strauss, sein Leben und seine Schriften* (1901); and T. Ziegler, *D. F. Strauss* (2 vols., 1908–1909).

STRAUSS, JOHANN (1804–1849), Austrian orchestral conductor and composer of dance-music, was born at Vienna on the 14th of March 1804. In 1819 he obtained his first engagement as a violinist in a small band then playing at the Sperl, in the Leopoldstadt, and after acting as deputy-conductor in another orchestra, he organized in 1825 a little band of fourteen performers on his own account. It was during the carnival of 1826 that Strauss inaugurated a long line of triumphs by introducing his band to the public of Vienna at the Schwan, in the Rossau suburb, where his famous *Täuberl-Walzer* (op. 1) at once established his reputation as the best composer of dance-music then living. Upon the strength of this success he was invited back to the Sperl, where he accepted an engagement, with an increased orchestra, for six years. Soon after this he was appointed kapellmeister to the 1st Bürger regiment, and entrusted with the duty of providing the music for the court balls; while the number of his private engagements was so great that he found it necessary to enlarge his band from time to time until it consisted of more than two hundred performers. In 1833 he began a long and extended series of tours throughout northern Europe, eventually visiting England in 1838. In Paris he associated himself with Musard, whose quadrilles became not much less popular than his own waltzes; but his greatest successes were achieved in London, where he arrived in time for the coronation of Queen Victoria, and played at seventy-two public concerts, besides innumerable balls and other private entertainments. The fatigue of these long journeys seriously injured Strauss's health; but he soon resumed his duties at the Sperl; and on the 5th of May 1840 he removed with his band to the Imperial "Volksgarten," which thenceforth became the scene of his most memorable successes, his conducting being marked by a quiet power which ensured the perfection of every minutest *nuance*. In 1844 Strauss began another extensive series of tours. In 1849 he revisited London, and, after his farewell concert, was escorted down the Thames by a squadron of boats, in one of which a band played tunes in his honour. This was his last public triumph. On his return to Vienna he was attacked with scarlet fever, of which he died on the 25th of September 1849.

Strauss was survived by three sons—Johann (1825–1899), Joseph (1827–1870) and Eduard (b. 1835), all of whom distinguished themselves as composers of dance-music, and assisted in recruiting the ranks and perpetuating the traditions of the still famous band.

STRAUSS, RICHARD (1864–   ), German composer, was born at Munich on the 11th of June 1864, the son of Franz Strauss, an eminent hornist. To some extent a prodigy, Strauss was something of a pianist at four, a composer at six, and at ten he was already seriously studying music under F. W. Meyer, the Munich Hofkapellmeister. Soon the result of this study began to make itself apparent. Singers sang Strauss's songs; the Walter Quartet played his *Quartet in A* (op. 2); Hermann Levi performed his *D minor Symphony*—a work that does not figure in the composer's list; and Bülow took the composer under his wing and introduced his early *Serenade* for wind instruments to the Meiningen public. For obvious reasons Strauss had not yet found himself. He had passed through the gymnasium and the university, and his music studies had been thorough. But all this had made of the youth merely an excellent technical musician, who in his *Eight Songs* (op. 10) and in his *Pianoforte Quartet* (op. 13) showed how strongly he was influenced by predecessors, Liszt in the one case, Mendelssohn in the other. Bülow's efforts to kindle in Strauss something of the fire of his own enthusiasm for Brahms's work ultimately proved fruitless. But to Bülow, and even more to Alexander Ritter, Strauss owed the awakening in his own mind of the interest in the modern development of music that eventually in its ripeness placed Strauss at the very top of the composers' tree of his time. In

1885 Strauss succeeded Bülow as conductor of the Meiningen orchestra, but the appointment was held only for a few months, since in April of this year Strauss resigned his post in order to travel in Italy, and on his return in the early autumn he became 3rd conductor of the Munich Opera under Hermann Levi. Four years later he was installed in Weimar as Hofkapellmeister, but once again he held his post only for a brief period, for in 1894, the year of his marriage to Pauline de Ahna, the eminent singer, he was promoted to be 1st conductor at Munich. Between these various appointments and that of Hofkapellmeister in Berlin (1899) Strauss travelled considerably in the near East and over Europe, now in search of health, anon in propagandism. His first professional visit to London was in 1897, and laid the foundation of a local English cult that culminated six years later in a Strauss festival. From that time Strauss's path lay in pleasant places. He frequently returned to London, notably to conduct a performance of *Elektra*, in Beecham's season at Covent Garden in the spring of 1910, and a part of a concert at Queen's Hall, when he achieved a genuine triumph by his conducting of Mozart's music.

Of the early period of Strauss the composer there is little of importance to be said. His early works were neither better nor worse than those of scores of talented students of an advanced skill in matters of technique. Indeed it has often been said, with some show of authority, that the ultimate development of Strauss is seen to any appreciable extent first in the symphonic poem *Macbeth* (op. 23). Here, in spite of the earlier *Don Juan* (op. 20), Strauss is himself, thematically and orchestrally, for the first time, for *Aus Italien* (op. 16) is a comparatively poor and quite unrepresentative effusion apart altogether from the *faux pas* contained in it by the mistaking of a popular song composed in St John's Wood, London, for a Neapolitan folk-song. A year only divides *Macbeth* (1887) from *Don Juan* (1888)—" Tondramen ohne Worte," as they have been called. But there is an age between them and *Tod und Verklärung* (1889)—the bridge from one part to the other and the opening of the second section of which are amongst Strauss's most glorious inspirations. Between the last-named work and *Till Eulenspiegels lustigen Streiche* (1894), Strauss's first opera, *Guntram* finds place (first performance, Weimar, 1894), the latter a work that in spite of much *réclame* for the composer failed to maintain a position upon the stage. In *Till Eulenspiegel* is to be found a sense of fun that is worthy of note (as of emulation), and it is perhaps worth recording that no more noteworthy example of the Rondo form exists in modern music, while its approximate successor, *Don Quixote* (1897), is an absolutely outstanding example of the Variation form. Further, Strauss reached in *Don Quixote* his zenith as a musical realist. In between there occurred the Nietzschean poem *Also sprach Zarathustra* (1895), which stirred up more temporary strife than any of its predecessors, if not so much perhaps as was engineered later on by the production of *Ein Heldenleben* (1898), or by the comparatively ingenuous *Symphonia domestica* (1904). For various reasons these compositions roused the somewhat sleepy academics of musical Europe from their lethargy. They revived, with the usual negative results, the ancient fight as to the legitimacy or otherwise of programme music. But though performances were comparatively rare in England up to the middle of 1910, those that had occurred proved undoubtedly attractive, while their rareness might quite reasonably be attributed to the very large fees demanded for their performance.

Up to 1910 Strauss had composed four operas. Of these, *Guntram* was on frankly Wagnerian lines. *Feuersnot*, on the other hand, a satirical, purely Munich work—a page out of the Munich annals, as it were, so closely is it identified with the Bavarian capital in its musical and personal reference, though produced at Dresden in 1901, remained sufficiently alive to have merited performance at His Majesty's theatre, London, again under Thomas Beecham's direction in July 1910. The same enthusiastic musician had previously produced *Elektra* with immense yet equal success in London (Covent Garden) in the early spring of 1910. Perhaps none of these operas enjoyed the *réclame* of *Salome* (Dresden 1905), which in England was originally barred by the censor of plays, but was performed several times at Covent Garden under Thomas Beecham in the autumn of 1910.

As a composer of songs Strauss enjoys the widest popularity in the conventional sense of the word. Many an example could be given from the hundred and more of his " Lieder " of Strauss's lawful right to be considered a lineal descendant of the royal line of German song writers. Some are transcendently beautiful. But this very fact has been thought to militate against his supreme greatness as a composer in the widest sense. The question, indeed, though in itself ridiculous, has been asked: which is the true Richard Strauss, the composer of the cacophonous *Ein Heldenleben* or of the exquisite *Morgen* or *Traum durch die Dämmerung?* But by 1910 he had at any rate won his place in the musical Walhalla. Whether the composer's name will survive by means of his many exquisite " Lieder," by means of his satire and grim humour, by means of his realism or his original classicism, remains to be seen. That his position is assured among the immortals is clear if only on account of his absolute independence of thought and of expression, of his prodigious breadth of artistic view and of his capacity to say his say in the musical language of his own day. His heartiest detractors admit that Strauss has enlarged the means of musical expression even if they cavil at his somewhat realistic utterance on occasion. To put it no higher, he must rank as a 20th-century Berlioz with a vastly wider musical knowledge and equipment. (R. H. L.)

STRAW and STRAW MANUFACTURES. Straw (from strew, as being used for strewing), is the general term applied to the stalky residue of grain-plants (especially wheat, rye, oats, barley). It forms the raw material of some important industries. It serves for the thatching of roofs, for a paper-making material, for ornamenting small surfaces as a " straw-mosaic," for plaiting into door and table mats, mattresses, &c., and for weaving and plaiting into light baskets, artificial flowers, &c. These applications, however, are insignificant in comparison with the place occupied by straw as a raw material for the straw bonnets and hats worn by both sexes. Of the various materials which go to the fabrication of plaited head-gear the most important is wheaten straw. It is only in certain areas that straw suitable for making plaits is produced. The straw must have a certain length of " pipe " between the knots, must possess a clear delicate golden colour and must not be brittle. The most valuable straw for plaits is grown in Tuscany, and from it the well-known Tuscan plaits and Leghorn hats are made. The straw of Tuscany, specially grown for plaiting, is distinguished into three qualities—*Pontederas Semone* being the finest, *Mazzuolo* the second quality, from which the bulk of the plaits are made, while from the third quality, *Santa Fioro*, only " Tuscan pedals " and braids are plaited. The wheat-seed for these straws is sown very thickly on comparatively elevated and arid land, and it sends up long attenuated stalks. When the grain in the ear is about half developed the straw is pulled up by the roots, dried in the sun, and subsequently spread out for several successive days to be bleached under the influence of alternate sunlight and night-dews. The pipe of the upper joint alone is selected for plaiting, the remainder of the straw being used for other purposes. These pipes are made up in small bundles, bleached in sulphur fumes in a closed chest, assorted into sizes, and so prepared for the plaiters. Straw-plaiting is a domestic industry among the women and young children of Tuscany and some parts of Emilia. Tuscan plaits and hats vary enormously in quality and value; the plait of a hat of good quality may represent the work of four or five days, while hats of the highest quality may each occupy six to nine months in making. The finest work is excessively trying to the eyes of the plaiters, who can at most give to it two or three hours' labour daily.

The districts around Luton in Bedfordshire and the neighbouring counties have, since the beginning of the 17th century, been the British home of the straw-plait industry. The straw of certain varieties of wheat cultivated in that region is, in favourable seasons, possessed of a fine bright colour and due tenacity and strength. The straw is cut as in ordinary harvesting, but is allowed to dry in the sun before binding. Subsequently straws are selected from the sheaves, and of these the pipes of the two upper joints are taken for plaiting. The pipes are assorted into sizes by passing them through graduated openings in a grilled wire frame, and those of good colour are bleached by the fumes of sulphur. Spotted and discoloured straws are dyed either in pipe or in plait. The plaiters work up the material in a damp state, either into whole straw or split straw plaits. Split straws are prepared with the aid of a small instrument having a projecting point which enters the straw pipe, and from which radiate the number of knife-edged cutters into which the straw is to be split. The plaiting of straw in the counties of Bucks., Beds., Berks. and Herts. formerly gave employment to many thousands of women and young children; but now vast quantities of plaits are imported at a very cheap rate from Italy, China and Japan. The result is that, while the Luton trade in the manufacture of straw and fancy hats of every description has largely extended, the number of English plaiters, all told, was not more than a few hundreds in 1907, as compared with 30,000 in 1871. The plaits are sewed partly by hand and in a special sewing-machine, and the hats or bonnets are finished by stiffening with gelatin size and blocking into shape with the aid of heat and powerful pressure, according to the dictates of fashion.

In the United States straw-plait work is principally centred in the state of Massachusetts.

Many substances besides straw are worked into plaits and braids for bonnets. Among these may be noticed thin strips of willow and cane and the fronds of numerous palms. "Brazilian" hats made from the fronds of the palmetto palms, *Sabal palmetto* and *S. mexicana*, are now largely made at St Albans. The famous Panama hats, fine qualities of which were at one time worth £20 to £30 each, are made from the leaves of the screw pine, *Carludovica palmata*. They are now manufactured at Dresden, Strassburg and Nancy, and can be purchased at 30s. or £2.

STRAWBERRY (*Fragaria*).—Apart from its interest as a dessert fruit, the strawberry has claims to attention by reason of the peculiarities of its structure and the excellent illustrations it offers of the inherent power of variation possessed by the plant and of the success of the gardener in availing himself of this tendency. The genus *Fragaria* consists of about eight species, native of the north temperate regions of both hemispheres, as well as of mountain districts in warmer climes; one species is found in Chile. The tufted character of the plant, and its habit of sending out long slender branches (runners) which produce a new bud at the extremity, are well known. The leaves have usually three leaflets palmately arranged, but the number of leaflets may be increased to five or reduced to one. While the flower has the typical Rosaceous structure, the so-called fruit is very peculiar, but it may be understood by the contrast it presents with the "hip" of the rose. In the last-named plant the top of the flower-stalk expands as it grows into a vase-shaped cavity, the "hip," within which are concealed the true fruits or seed-vessels. In the rose the extremity of the floral axis is concave and bears the carpels in its interior. In the strawberry the floral axis, instead of becoming concave, swells out into a fleshy, dome-shaped or flattened mass in which the carpels or true fruits, commonly called pips or seeds, are more or less embedded but never wholly concealed. A ripe strawberry in fact may be aptly compared to the "fruit" of a rose turned inside out.

The common wild strawberry of Great Britain (fig. 1), which indeed is found throughout Europe and great part of temperate Asia and North America, is *Fragaria vesca*, and this was the first species brought under cultivation in the early part of the 17th century. Later on other species were introduced, such as *F. elatior*, a European species, the parent stock of the hautbois strawberries, and especially *F. virginiana* from the United States and *F. chiloensis* from Chile. From these species, crossed and recrossed in various manners, have sprung the vast number of different varieties now enumerated in catalogues, whose characteristics are so inextricably blended that the attempt to trace their exact parentage or to follow out their lineage has become impossible. The varieties at present cultivated vary in the most remarkable degree in size, colour, flavour, shape, degree of fertility, season of ripening, liability to disease and constitution of plant. Some, as previously stated, vary in foliage; others produce no runners, and some vary materially in the relative development of their sexual organs, for, while in most cases the flowers are in appearance hermaphrodite, at least in structure, there is a very general tendency towards a separation of the sexes, so that the flowers are males or females only

FIG. 1.—Wild Strawberry (*Fragaria vesca*). In flower and fruit, and bearing a runner.

as to function, even although they may be perfect in construction. This tendency to dioecism is a common characteristic among Rosaceae, and sometimes proves a source of disappointment to the cultivator, who finds his plants barren where he had hoped to gather a crop. This happens in the United States more frequently than in Britain, but when recognized can readily be obviated by planting male varieties in the vicinity of the barren kinds. Darwin, in alluding to the vast amount of variability in the so-called "fruit"—a change effected by the art of the horticulturist in less than three centuries—contrasts with this variability the fixity and permanence of character presented by the true fruits, or pips, which are distributed over the surface of the swollen axis. The will and art of the gardener have been directed to the improvement of the one organ, while he has devoted no attention to the other, which consequently remains in the same condition as in the wild plant. Too much stress is not, however, to be laid on this point, for it must be remembered that the foliage, which is not specially an object of the gardener's "selection," nevertheless varies considerably.

The larger-fruited sorts are obtained by crossing from *F. chiloensis* and *F. virginiana*, and the smaller alpines from *F. vesca*. The alpine varieties should be raised from seeds; while the other sorts are continued true to their kinds by runners. If new varieties are desired, these are obtained by judicious crossing and seeding.

The seeds of the alpines should be saved from the finest fruit ripened early in the summer. They may at once be sown, either in a sheltered border outdoors or in pots, or better in March under glass, when they will produce fruits in June of the same year. The soil should be rich and light, and the seeds very slightly covered by sifting over them some leaf-mould or old decomposed cow dung. When the plants appear and have made five or six leaves, they are transplanted to where they are to remain for bearing. The seeds sown in pots may be helped on by gentle heat, and when the plants are large enough they are pricked out in fine rich soil, and in June transferred to the open ground for bearing; they will produce a partial crop in the autumn, and a full one in the following season. The same treatment may be applied to the choicer seedlings of the larger-fruited sorts from which new varieties are expected. Amongst the best alpine strawberries, to which the name of "perpetual" has now been given, are those known as St Joseph and St Anthony of Padua.

The runners of established sorts should be allowed to root in the soil adjoining the plants, which should, therefore, be kept light and fine, or layered into small pots as for forcing. As soon as a few leaves are produced on each the secondary runners should be stopped. When the plants have become well-rooted they should at once be planted out. They do best in a rather strong loam, and should be kept tolerably moist. The scarlet section prefers a rich sandy loam. The ground should be trenched 2 or 3 ft. deep, and supplied with plenty of manure, a good proportion of which should lie just below the roots, 10 or 12 in. from the surface. The plants may be put in on an average about 2 ft. apart.

A mulching of strawy manure put between the rows in spring serves to keep the ground moist and the fruit clean, as well as to afford nourishment to the plants. Unless required, the runners are cut off early, in order to promote the swelling of the fruit. The plants are watered during dry weather after the fruit is set, and occasionally till it begins to colour. As soon as the fruit season is over, the runners are again removed, and the ground hoed and raked. The plantation should be renewed every second or third year, or less frequently if kept free of runners, if the old leaves are cut away after the fruit has been gathered, and if a good top-dressing of rotten dung or leaf-mould is applied. A top-dressing of loam is beneficial if applied before the plants begin to grow in spring, but after that period they should not be disturbed during the summer either at root or at top. If the plants produce a large number of flower-scapes, each should, if fine large fruit is desired, have them reduced to about four of the strongest. The lowest blossoms on the scape will be found to produce the largest, earliest and best fruits. The fruit should not be gathered till it is quite ripe, and then, if possible, it should be quite dry, but not heated by the sun. Those intended for preserving are best taken without the stalk and the calyx.

Forcing.—The runners propagated for forcing are layered into 3-in. pots, filled with rich soil, and held firm by a piece of raffia, a peg or stone. If kept duly watered they will soon form independent plants. The earlier they are secured the better. When firmly rooted they are removed and transferred into well-drained 6-in. pots, of strong well-enriched loam, the soil being rammed firmly into the pots, which are to be set in an open airy place. In severe frosts they should be covered with dry litter or bracken, but do not necessarily require to be placed under glass. They are moved into the forcing houses as required. The main points to be kept in view in forcing strawberries are, first, to have strong stocky plants, the leaves of which have grown sturdily from being well exposed to light, and secondly, to grow them on slowly till fruit is set. When they are first introduced into heat, the temperature should not exceed 45° or 50° by fire heat, and air must be freely admitted; should the leaves appear to grow up thin and delicate, less fire heat and more air must be given, but an average temperature of 55° by day may be allowed and continued while the plants are in flower. When the fruit is set the heat may be gradually increased, till at the ripening period it stands at 65°, and occasionally at 75° by sun heat. While the fruit is swelling the plants should never be allowed to get dry, but when it begins to colour no more water should be given than is absolutely requisite to keep the leaves from flagging. The plants should be removed from the house as soon as the crop is gathered. The forced plants properly hardened make first-rate outdoor plantations, and if put out early in summer, in good ground, will often produce a useful autumnal crop.

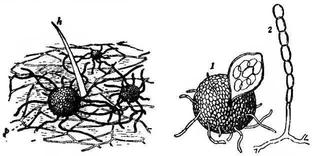


FIG. 2.—*Sphaerotheca humuli*, Hop and Strawberry Mildew.

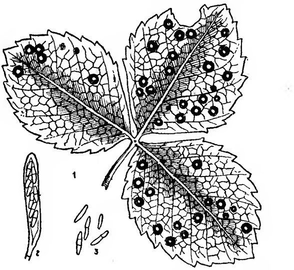
Small portion of surface of hop leaf showing the fructification or perithecia (p) of the fungus attached to the surface; h, a hair of the leaf surface. 1, A single perithecium bursting; 2, a chain of spores or conidia. (1 and 2 × 400.)

Diseases.—The most troublesome fungoid attacks to which the strawberry is subject are mildew and leaf-spot. The former, like all mildews, attacks the leaves and spreads to the fruit, these being covered with the white mycelium. The fungus is identical with that causing mildew in hops (*Sphaerotheca humuli*), and its development is greatly furthered by exposure of its host to cold draughts or low night temperatures. Spraying the foliage with potassium sulphide (½ oz. to 1 gallon of water) should hold it in check, but the plants should not be sprayed when the fruit is developing. The "leaf-spot" is caused by the fungus *Sphaerella fragoriae*. The first symptom of this attack is the appearance of small, circular, white spots on the leaves, having a broad, definite, dark reddish margin.



(From George Massee's *Textbook of Plant Diseases*, by permission of Duckworth & Co.)

FIG. 3.—*Sphaerella fragariae.*

1, Strawberry leaf showing diseased spots.
2, Ascus with eight spores from a perithecium.
3, Spores or conidia of the *Ramularia* stage.

On these spots a whitish mould (formerly considered to be a distinct species under the name *Ramularia tulasnei*) develops, and this is followed later by the perfect form of the fungus, the fruits of which appear to the naked eye as small black spots seated on the white dead spot on the leaf. Potassium sulphide may be used as for the mildew, or, perhaps better, Bordeaux mixture. It has been recommended to cut off the leaves after fruiting and burn the beds over so as to destroy the fungus in the leaves.

The grubs of the cockchafer (*Melolontha vulgaris*) and the rose-chafer (*Cetonia aurata*) frequently feed upon the roots of the strawberry and do considerable damage, while the larvae of the garden swift moth (*Hepialus*) behave in a similar way. The imago of *Cetonia aurata* also frequently damages the flowers of the strawberry by devouring their centres, and is often troublesome in this way in forcing-houses particularly. The carnivorous ground beetles, particularly *Pterostichus nigra* and *Harpalus rufimanus*, when the fruit is ripe attack it at night, returning to the soil in the daytime. They are to be caught by placing jars containing some attractive matter, such as meat and water, at intervals about the beds with their mouths sunk level with the surface of the soil. Millepedes also are often found in the ripe fruit, but occur mostly where the soil is very rich in organic matter and poor in lime.

STREATHAM, a large residential district in the south of London, England, within the municipal borough of Wandsworth. The name appears to indicate its position on an ancient "street" or highway. According to Domesday, Streatham included several manors, two of which, Tooting and Balham (to follow the modern nomenclature), belonged to the abbot of St Mary de Bec in Normandy. One of several public grounds in the neighbourhood of Streatham is called Tooting Bec Common. The parish church of St Leonard, Streatham, contains among its memorials that of Henry Thrale (d. 1781), with an inscription by Samuel Johnson, who was a constant visitor at Thrale's house, Streatham Park, which is no longer standing.

STREATOR, a city of La Salle county, Illinois, U.S.A., on the Vermilion river, in the N. part of the state, about 95 m. S.W. of Chicago. Pop. (1890), 11,414; (1900), 14,079, of whom 3740 were foreign-born; (1910 census) 14,253; land area, 2·97 sq. m. It is served by the Atchison, Topeka & Santa Fé, the Chicago, Burlington & Quincy, the Chicago & Alton, the Chicago, Indiana & Southern and the Wabash railways. Streator has a public library and a Chautauqua auditorium. It is in the Vermilion coal region, and clay for brick and tile is abundant in its vicinity. The city's manufactures include glass, brick, tile, foundry and machine-shop products, &c. In 1905 the factory product was valued at $1,888,894, being 51·4% greater than in 1900. Streator was laid out in 1868, was incorporated as a village in 1870 and was chartered as a city in 1882.

STREET, GEORGE EDMUND (1824–1881), English architect, was born at Woodford in Essex on the 20th of June 1824. He was the third son of Thomas Street, solicitor, by his second wife, Mary Anne Millington. George went to school at Mitcham in about 1830, and later to the Camberwell collegiate school, which he left in 1839. For a few months he was in his father's business in Philpot Lane, but on his father's death he went to live with his mother and sister at Exeter. There his thoughts first turned to architecture, and in 1841 his mother obtained a place for him as pupil in the office of Mr Owen Carter at Winchester. Afterwards he worked for five years as an "improver" with Sir George Gilbert Scott in London. At an early age Street became deeply interested in the principles of Gothic architecture, and devoted an unsparing amount of time and labour to studying and sketching the finest examples of medieval buildings in England and on the Continent. His first commission was for the designing of Biscoray Church, Cornwall. In 1849 he took an office of his own. He was a draughtsman of a very high order; his sketches are masterpieces of spirit and brilliant touch. In 1855 he published a very careful and well-illustrated work on *The Brick and Marble Architecture of Northern Italy*, and in 1865 a book on *The Gothic Architecture of Spain*, with very beautiful drawings by his own hand. Street's personal taste led him in most cases to select for his design the 13th-century Gothic of England or France, his knowledge of which was very great, especially in the skilful use of rich mouldings. By far the majority of the buildings erected by him were for ecclesiastical uses, the chief being the convent of East Grinstead, the theological college at Cuddesden and a very large number of churches, such as St Philip and St James's at Oxford, St John's at Torquay, All Saints' at Clifton, St Saviour's at Eastbourne, St Margaret's at Liverpool and St Mary Magdalene, Paddington. His largest works were the nave of Bristol Cathedral, the choir of the cathedral of Christ Church in Dublin, and, above all, the new courts of justice in London. The competition for this was prolonged and much diversity of opinion was expressed. Thus, the judges wanted Street to make the exterior arrangements and Barry the interior, while a special committee of lawyers recommended the designs of Alfred Waterhouse. In June 1868, however, Street was appointed sole architect; but the building was not complete at the time of his death in December 1881. Street was elected an associate of the Royal Academy in 1866, and R.A. in 1871; at the time of his death he was professor of architecture to the Royal Academy, where he had delivered a very interesting course of lectures on the development of medieval architecture. He was also president of the Royal Institute of British Architects. He was a member of the Royal Academy of Vienna, and in 1878, in reward for drawings sent to the Paris Exhibition, he was made a knight of the Legion of Honour. Street was twice married, first on the 17th of June 1852 to Mariquita, second daughter of Robert Proctor, who died in 1874, and secondly on the 11th of January 1876 to Jessie, second daughter of William Holland, who died in the same year. The architect's own death, on the 18th of December 1881, was hastened by overwork and professional worries connected with the erection of the law courts. He was buried on the 29th of December in the nave of Westminster Abbey.

STRELITZ (*Strjeltsi*), a body of Russian household troops originally raised by the tsar Ivan the Terrible in the middle of the 16th century. They numbered 40,000 to 50,000 infantry, and formed the greater part of the Russian armies in the wars of the 16th and 17th centuries. They were a fierce and ill-disciplined force, individually brave and cruel in war, and almost ungovernable in peace. Their mutinies were frequent and dangerous, and at last, in 1682, an unusually serious outbreak led Peter the Great to compass the abolition of the force. The Strelitz were gradually drawn to the western frontier of Russia, and in 1698 they rose in mutiny for the last time. Crushed in battle by Peter's general, Patrick Gordon, they ceased to exist as a military force, and about 2000 of them who fell into the hands of the tsar were barbarously tortured and put to death.

STRENGTH OF MATERIALS, that part of the theory of engineering which deals with the nature and effects of stresses in the parts of engineering structures. Its principal object is to determine the proper size and form of pieces which have to bear given loads, or, conversely, to determine the loads which can be safely applied to pieces whose dimensions and arrangement are already given. It also treats of the relation between the applied loads and the changes of form which they cause. The subject comprises experimental investigation of the properties of materials as to strength and elasticity, and mathematical discussion of the stresses in ties, struts, beams, shafts and other elements of structures and machines.

Stress is the mutual action between two bodies, or between two parts of a body, whereby each of the two exerts a force upon the other. Thus, when a stone lies on the ground there is at the surface of contact a stress, one aspect of which is the force directed downwards with which the stone pushes the ground, and the other aspect is the equal force directed upwards with which the ground pushes the stone. A body is said to be in a state of stress when there is a stress between the two parts which lie on opposite sides of an imaginary surface of section. A pillar or block supporting a weight is in a state of stress because at any cross section the part above the section pushes down against the part below, and the part below pushes up against the part above. A stretched rope is in a state of stress, because at any cross section the part on each side is pulling the part on the other side with a force in the direction of the rope's length. A plate of metal that is being cut in a shearing machine is in a state of stress, because at the place where it is about to give way the portion of metal on either side of the plane of shear is tending to drag the portion on the other side with a force in that plane.

Normal and Tangential Stress.—In a solid body which is in a state of stress the direction of stress at an imaginary surface of division may be normal, oblique or tangential to the surface. When oblique it is conveniently treated as consisting of a normal and a tangential component. Normal stress may be either push (compressive stress) or pull (tensile stress). Stress which is tangential to the surface is called shearing stress. Oblique stress may be regarded as so much push or pull along with so much shearing stress. The amount of stress per unit of surface is called the intensity of stress. Stress is said to be uniformly distributed over a surface when each fraction of the area of surface bears a corresponding fraction of the whole stress. If a stress P is uniformly distributed over a plane surface of area S, the intensity is P/S. If the stress is not uniformly distributed, the intensity at any point is $\delta P/\delta S$, where δP is the amount of stress on an indefinitely small area δS at the point considered. For practical purposes intensity of stress is usually expressed in tons weight per square inch, pounds weight per square inch, or kilogrammes weight per square millimetre or per square centimetre.

Simple Longitudinal Stress.—The simplest possible state of stress is that of a short pillar or block compressed by opposite forces applied at its ends, or that of a stretched rope or other tie. In these cases the stress is wholly in one direction, that of the length. These states may be distinguished as simple longitudinal push and simple longitudinal pull. In them there is no stress on planes parallel to the direction of the applied forces.

Compound Stress.—A more complex state of stress occurs if the block is compressed or extended by forces applied to a pair of opposite sides, as well as by forces applied to its ends—that is to say, if two simple longitudinal stresses in different directions act together. A still more complex state occurs if a third stress be applied to the remaining pair of sides. It may be shown (see ELASTICITY) that any state of stress which can possibly exist at any point of a body may be produced by the joint action of three simple pull or push stresses in three suitably chosen directions at right angles to each other. These three are called principal stresses, and their directions are called the axes of principal stress. These axes have the important property that the intensity of stress along one of them is greater, and along another it is less, than in any other direction. These are called respectively the axes of greatest and least principal stress.

Resolution of Stress.—Returning now to the case of a single simple longitudinal stress, let AB (fig. 1) be a portion of a tie or a strut which is being pulled or pushed in the direction of the axis AB with a total stress P. On any plane CD taken at right angles to the axis we have a normal pull or push of intensity $p = P/S$, S being the area of the normal cross-section. On a plane EF whose normal is inclined to the axis at an angle θ we have a stress still in the direction of the axis, and therefore oblique to the plane EF, of intensity P/S', where S' is the area of the surface EF, or $S/\cos\theta$. The whole stress P on EF may be resolved into two components, one normal to EF, and the other a shearing stress tangential to EF. The normal component (P_n, fig. 2) is $P\cos\theta$: the tangential component (P_t) is $P\sin\theta$. Hence the intensity of normal pull or push on EF, or p_n, is $p\cos^2\theta$, and the intensity of shearing stress EF, or p_t, is $p\sin\theta\cos\theta$. This expression makes p_t a maximum when $\theta = 45°$: surfaces inclined at 45° to the axis are called surfaces of maximum shearing stress; the intensity of shearing stress on them is $\frac{1}{2}p$.

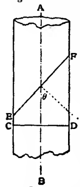


FIG. 1.

FIG. 2.

Combination of Two Simple Pull or Push Stresses at Right Angles to One Another.—Suppose next that there are two principal stresses: in other words that in addition to the simple pull or push stress of fig. 1 there is a second pull or push stress acting at right angles to it as in fig. 3. Call these P_x and P_y respectively. On any inclined surface EF there will be an intensity of stress whose normal component p_n and tangential component p_t are found by summing up the effects due to P_x and P_y separately. Let p_x and p_y be the intensities of stress produced by P_x and P_y respectively on planes perpendicular to their own directions. Then

$$p_n = (P_x\cos^2\theta + p_y\sin^2\theta,$$
$$p_t = (p_x - p_y)\sin\theta\cos\theta,$$

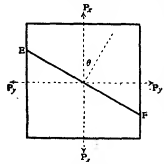

FIG. 3.

θ being the angle which the normal to the surface makes with the direction of P_x.

The tangential stress p_t becomes a maximum when θ is 45°, and its value then is

$$\text{Max. } p_t = \tfrac{1}{2}(p_x - p_y).$$

If in addition there is a third principal stress P_z, it will not produce any tangential component on planes perpendicular to the plane of the figure. Hence the above expression for the maximum tangential stress will still apply, and it is easy to extend this result so as to reach the important general proposition that in any condition of stress whatever the maximum intensity of shearing stress is equal to one-half the difference between the greatest and least principal stresses and occurs on surfaces inclined at 45° to them.

State of Simple Shear.—A special case of great importance occurs when there are two principal stresses only, equal in magnitude and opposite in sign; in other words, when one is a simple push and the other a simple pull. Then on surfaces inclined at 45° to the axes of pull and push there is nothing but tangential stress, for $p_n = 0$; and this intensity of tangential stress is numerically equal to p_x or to p_y. This condition of stress is called a state of simple shear.

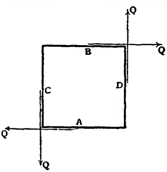

FIG. 4.

The state of simple shear may also be arrived at in another way. Let an elementary cubical part of any solid body (fig. 4) have tangential stresses QQ applied to one pair of opposite faces, A and B, and equal tangential stresses applied to a second pair of faces C and D, as in the figure. The effect is to set up a state of simple shear. On all planes parallel to A and B there is nothing but tangential stress, and the same is true of all planes parallel to C and D. The intensity of the stress on both systems of planes is equal throughout to the intensity of the stress which was applied to the face of the block.

To see the connexion between these two ways of specifying a state of simple shear consider the equilibrium of the parts into which the block may be divided by ideal diagonal planes of section. To balance the forces QQ (fig. 5), there must be normal pull on the diagonal plane, the amount of which is $P = Q\sqrt{2}$. But the area of the surface over which P acts is greater than that of the surface over which Q acts in the proportion which P bears to Q, and hence the intensity of P is the same as the intensity of Q.

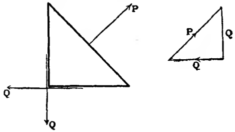

FIG. 5.

Again, taking the other diagonal plane (fig. 6), the same argument applies except that here the normal force P required for equilibrium is a push instead of a pull. Thus the state of stress represented in fig. 4 admits of analysis into two equal principal stresses, one of push and one of pull, acting in directions at right angles to one another and inclined at 45° to the planes of shear stress.

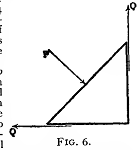

FIG. 6.

Equality of Shearing Stress in Two Directions.—No tangential stress can exist in one direction without an equal intensity of tangential stress existing in another direction at right angles to the first. To prove this it is sufficient to consider the equilibrium of the elementary cube of fig. 4. The tangential forces acting on two sides A and B produce a couple which tends to rotate the cube. No arrangement of normal stresses on any of the three pairs of sides of the cube can balance this couple; that can be done only by equal tangential forces on C and D.

Fluid Stress.—Another important case occurs when there are three principal stresses all of the same sign and of equal intensity p. The tangential components on any planes cancel each other: the stress on every plane is wholly normal and its intensity is p. This is the only state of stress that can exist in a fluid at rest because a fluid exerts no statical resistance to shear. For this reason the state is often spoken of as a fluid stress.

Strain is the change of shape produced by stress. If the stress is a simple longitudinal pull, the strain consists of lengthening in the direction of the pull, accompanied by contraction in both directions at right angles to the pull. If the stress is a simple push, the strain consists of shortening in the direction of the push and expansion in both directions at right angles to that; the stress and the strain are then exactly the reverse of what they are in the case of simple pull. If the stress is one of simple shearing, the strain consists of a distortion such as would be produced by the sliding of layers in the direction of the shearing stresses.

A material is elastic with regard to any applied stress if the strain disappears when the stress is removed. Strain which persists after the stress that produced it is removed is called permanent set. For brevity, it is convenient to speak of strain which disappears when the stress is removed as elastic strain.

Limits of Elasticity.—Actual materials are generally very perfectly elastic with regard to small stresses, and very imperfectly elastic with regard to great stresses. If the applied stress is less than a certain limit, the strain is in general small in amount, and disappears wholly, or almost wholly, when the stress is removed. If the applied stress exceeds this limit, the strain is, in general, much greater than before, and most of it is found, when the stress is removed, to consist of permanent set. The

Figs. 3, 4, 5, 6, 15, 16, 17, 18, 19, 20, 23, 24 and 25 are from Ewing's *Strength of Materials*, by permission of the Cambridge University Press.

limits of stress within which strain is wholly or almost wholly elastic are called limits of elasticity.

For any particular mode of stress the limit of elasticity is much more sharply defined in some materials than in others. When well defined it may readily be recognized in the testing of a sample from the fact that after the stress exceeds the limit of elasticity the strain begins to increase in a much more rapid ratio to the stress than before. This characteristic goes along with the one already mentioned, that up to the limit the strain is wholly or almost wholly elastic.

Hooke's Law.—Within the limits of elasticity the strain produced by a stress of any one kind is proportional to the stress producing it. This is Hooke's law, enunciated by him in 1676.

In applying Hooke's law to the case of simple longitudinal stress —such as the case of a bar stretched by simple longitudinal pull— we may measure the state of strain by the change of length per unit of original length which the bar undergoes when stressed. Let the original length be l, and let the whole change of length be δl when a stress is applied whose intensity p is within the elastic limit. Then the strain is measured by $\delta l/l$, and this by Hooke's law is proportional to p. This may be written

$$\delta l/l = p/\mathrm{E},$$

where E is a constant for the particular material considered. The same value of E applies to push and to pull, these modes of stress being essentially continuous, and differing only in sign.

Young's Modulus.—This constant E is called the modulus of longitudinal extensibility, or Young's modulus. Its value, which is expressed in the same units as are used to express intensity of stress, may be measured directly by exposing a sample of the material to longitudinal pull and noting the extension, or indirectly by measuring the flexure of a loaded beam of the material, or by experiments on the frequency of vibrations. It is frequently spoken of by engineers simply as the modulus of elasticity, but this name is too general, as there are other moduli applicable to other modes of stress. Since $\mathrm{E} = pl/\delta l$, the modulus may be defined as the ratio of the intensity of stress p to the longitudinal strain $\delta l/l$.

Modulus of Rigidity.—In the case of simple shearing stress, the strain may be measured by the angle by which each of the four originally right angles in the square prism of fig. 3 is altered by the distortion of the prism. Let this angle be ϕ in radians; then by Hooke's law $p/\phi = \mathrm{C}$, where p is the intensity of shearing stress and C is a constant which measures the rigidity of the material. C is called the modulus of rigidity, and is usually determined by experiments on torsion.

Modulus of Cubic Compressibility.—When three simple stresses of equal intensity p and of the same sign (all pulls or all pushes) are applied in three directions, the material (provided it be isotropic, that is to say, provided its properties are the same in all directions) suffers change of volume only, without distortion of form. If the volume is V and the change of volume δV, the ratio of the stress p to the strain δV/V is called the modulus of cubic compressibility, and will be denoted by K.

Of these three moduli the one of most importance in engineering applications is Young's modulus E. When a simple longitudinal pull or push of intensity p is applied to a piece, the longitudinal strain of extension or compression is p/E. This is accompanied by a lateral contraction or expansion, in each transverse direction, whose amount may be written $p/\sigma\mathrm{E}$, where σ is the ratio of longitudinal to lateral strain. It is shown in the article ELASTICITY, that for an isotropic material

$$\mathrm{E} = \frac{9\mathrm{CK}}{3\mathrm{K}+\mathrm{C}} \text{ and } \sigma = \frac{2(3\mathrm{K}+\mathrm{C})}{3\mathrm{K}-2\mathrm{C}}.$$

Plastic Strain.—Beyond the limits of elasticity the relation of strain to stress becomes very indefinite. Materials then exhibit, to a greater or less degree, the property of plasticity. The strain is much affected by the length of time during which the stress has been in operation, and reaches its maximum, for any assigned stress, only after a long (perhaps an indefinitely long) time. Finally, when the stress is sufficiently increased, the ratio of the increment of strain to the increment of stress becomes indefinitely great if time is given for the stress to take effect. In other words, the substance then assumes what may be called a completely plastic state; it *flows* under the applied stress like a viscous liquid.

Ultimate Strength.—The ultimate strength of a material with regard to any stated mode of stress is the stress required to produce rupture. In reckoning ultimate strength, however, engineers take, not the actual intensity of stress at which rupture occurs, but the value which this intensity would have reached had rupture ensued without previous alteration of shape. Thus, if a bar whose original cross-section is 2 sq. in. breaks under a uniformly distributed pull of 60 tons, the ultimate tensile strength of the material is reckoned to be 30 tons per square inch, although the actual intensity of stress which produced rupture may have been much greater than this, owing to the contraction of the section previous to fracture. The convenience of this usage will be obvious from an example. Suppose that a piece of material of the same quality be used in a structure under conditions which cause it to bear a simple pull of 6 tons per square inch; we conclude at once that the actual load is one-fifth of that which would cause rupture, irrespective of the extent to which the material might contract in section if overstrained. The stresses which occur in engineering practice are, or ought to be, in all cases within the limits of elasticity, and within these limits the change of cross-section caused by longitudinal pull or push is so small that it may be neglected in reckoning the intensity of stress.

Ultimate tensile strength and ultimate shearing strength are well defined, since these modes of stress (simple pull and simple shearing stress) lead to distinct fracture if the stress is sufficiently increased. Under compression some materials yield so continuously that their ultimate strength to resist compression can scarcely be specified; others show so distinct a fracture by crushing that their compressive strength may be determined with some precision.

Some of the materials used in engineering, notably timber and wrought iron, are so far from being isotropic that their strength is widely different for stresses in different directions. In the case of wrought iron the process of rolling develops a fibrous structure on account of the presence of streaks of slag which become interspersed with the metal in puddling; and the tensile strength of a rolled plate is found to be considerably greater in the direction of rolling than across the plate. Steel plates, being rolled from a nearly homogeneous ingot, have nearly the same strength in both directions, provided the process of rolling is completed at a temperature high enough to allow recrystallization to take place in cooling. Cold-rolled or cold-drawn metal is not isotropic because the crystals of which it is made up have been elongated in one direction by the process: but isotropy may be restored by heating the piece sufficiently to allow the crystals to re-form.

Permissible Working Stress.—In applying a knowledge of the strength of materials to determine the proper sizes of parts in an engineering structure we have to estimate a permissible working stress. This is based partly on special tests and partly on experience of the behaviour of the material when used in similar structures. The working stress is rarely so much as one-third of the ultimate strength; it is more commonly one-fourth or one-fifth and in some cases, especially where the loads to be borne are liable to reversal or to much change, it may be prudent to make the working stress even less than this.

Factor of Safety.—The ratio of the ultimate strength to the working stress is called the factor of safety. The factor should in general be such as to bring the working stress within the limit of elasticity and even to leave within that limit a margin which will be ample enough to cover such contingencies as imperfection in the theory on which the calculation of the working stress is founded, lack of uniformity in the material itself, uncertainty in the estimation of loads, imperfections of workmanship which may cause the actual dimensions to fall short of those that have been specified, alterations arising from wear, rust and so forth. An important distinction has to be drawn in this connexion between steady or "dead" loads and loads which are subject to variation and especially to reversal. With the former the working stress may reach or pass the elastic limit without destroying the structure; but in a piece subject to reversals a stress of the same magnitude would lead inevitably to rupture, and hence a larger margin should be left to ensure that in the latter case the elastic limit shall not even be approached.

It is in fact the elastic limit rather than the ultimate strength of the material on which the question mainly depends of how high the working stress may safely be allowed to rise in any particular conditions as to mode of loading, and accordingly it becomes a matter of much practical importance to determine by tests the amount of stress which can be borne without permanent strain. From an engineering point of view the structural merit of a material, especially when variable loads and possible shocks have to be sustained, depends not only on the strength but also on the extent to which the material will bear deformation without rupture. This characteristic is shown in tests made to determine tensile strength by the amount of ultimate elongation, and also by the contraction of the cross-section which occurs through the flow of the metal before rupture. It is often, tested in other ways, such as by bending and unbending bars in a circle of specified radius, or by examining the effect of repeated blows. Tests by impact are generally made by causing a weight to fall through a regulated distance on a piece of the material supported as a beam.

Tests of Strength.—Ordinary tests of strength are made by submitting the piece to direct pull, direct compression, bending or torsion. Testing machines are frequently arranged so that they may apply any of these four modes of stress; tests by direct tension are the most common, and next to them come tests by bending. When the samples to be tested for tensile strength are mere wires, the stress may be applied directly by weights; for pieces of larger section some mechanical multiplication of force becomes necessary. Owing to the plasticity of the materials to be tested, the applied loads must be able to follow considerable change of form in the test-piece: thus in testing the tensile strength of wrought iron or steel provision must be made for taking up the large extension of length which occurs before fracture. In most modern forms of large testing machines the loads are applied by means of hydraulic pressure acting on a piston or plunger to which one end of the specimen is secured, and the stress is measured by connecting lever. The lower holder is jointed to a cross-head C, which is connected by two vertical screws to a lower cross-head B, upon which the hydraulic plunger shown in section in fig. 7 exerts its thrust. G is a counterpoise which pushes up the plunger when the water is allowed to escape. Hydraulic pressure may be applied to the plunger by pumps or by an accumulator. In the present instance it is applied by means of an auxiliary plunger Q, which is pressed by screw gearing into an auxiliary cylinder. Q is driven by a belt on the pulley D. This puts stress on the specimen, and the weight W is then run out along the lever so that the lever is just kept floating between the stops E, E. Before the test-piece is put in the distance between the holders is regulated by means of the screws connecting the upper and lower cross-heads C and B, these screws being turned by a handle applied at F. The knife edges are made long enough to prevent the load on them from ever exceeding 5 tons to the linear inch. To adapt a machine of this class for tests in compression, a small platform is suspended like a stirrup by four rods from the weigh-beam, and hangs below the cross-head, which is pulled

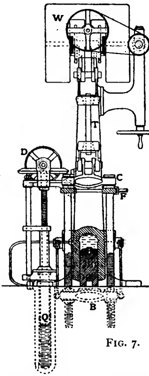

FIG. 7.

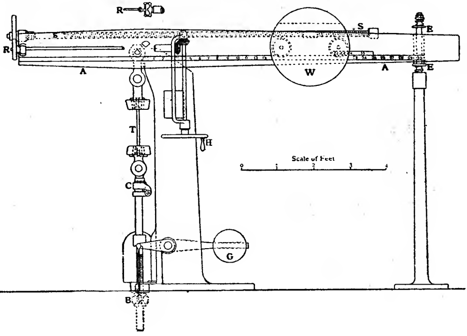

FIG. 8.

the other end to a lever or system of levers provided with adjustable weights. In small machines, and also in some large ones, the stress is applied by screw gearing instead of by hydraulic pressure. Springs are sometimes used instead of weights to measure the stress, and another plan is to make one end of the specimen act on a diaphragm forming part of a hydrostatic pressure gauge.

Single-lever Testing Machine.—Figs. 7 and 8 show an excellent form of single-lever testing machine designed by J. H. Wicksteed (*Proc. Inst. Mech. Eng.*, August 1882) in which the stress is applied by an hydraulic plunger and is measured by a lever or steelyard and a movable weight. The illustration shows a 30-ton machine, but machines of similar design are in common use which exert a force of 100 tons or more. AA is the lever, on which there is a graduated scale. The stress on the test-piece T is measured by a weight W of 1 ton (with an attached vernier scale), which is moved along the lever by a screw-shaft S; this screw-shaft is driven by a belt from a parallel shaft R, which takes its motion, through bevel-wheels and a Hooke's joint in the axis of the fulcrum, from the hand-wheel H. (The Hooke's joint in the shaft R is shown in a separate sketch above the lever in fig. 8.) The holder for the upper end of the sample hangs from a knife-edge 3 in. from the fulcrum of the down when the hydraulic cylinder is put in action. The arrangement is that of two stirrups linked with one another, so that when the two pull against each other a block of material placed between them becomes compressed. For tests in bending one of the stirrups, namely, the platform which hangs from the weigh-beam, is made some 4 or 5 ft. long, and carries two knife-edge supports at its ends on which the ends of the piece that is to be bent rest, while the cross-head presses down upon the middle of the piece. In both cases the force which is exerted is measured by means of the weigh-beam and travelling weight, just as in the tension tests. To apply the force continuously, without shock, and either quickly or slowly at will, a very convenient plan is to use an hydraulic intensifier, consisting of a large hydraulic piston operating a much smaller one. By gradually admitting water to the large piston from any convenient source under moderate pressure, such as the town water mains, a progressively increased pressure is produced in the fluid on which the small piston acts, and this fluid is admitted to the straining cylinder of the machine. One of the advantages of the vertical type of machine, with its single horizontal lever, is the facility with which the correctness of its readings may be verified. The two things to be tested are (1) the distance between the knife-edges, one of which forms the fulcrum of the weigh-beam and from the other of which the shackle holding the upper end of the specimen is hung, and (2) the weight of the travelling poise. The weight of the poise is readily ascertained by using a supplementary known weight to apply a known moment to the beam, and measuring how far the poise has to be moved to restore equilibrium. The distance between the knife-edges is then found by hanging a known heavy weight from the shackle, and again observing how far the poise has to be moved. Another example of the single-lever type is the Werder testing machine, much used on the continent of Europe. In it the specimen is horizontal; one end is fixed, the other is attached to the short vertical arm of a bell-crank lever, whose fulcrum is pushed out horizontally by an hydraulic ram.[1]

Multiple-lever Testing Machines.— In many other testing machines a system of two, three or more levers is employed to reduce the force between the specimen and the measuring weight. In most cases the fulcrums are fixed, and the stress is applied to one end of the specimen by hydraulic power or by screw gearing, which takes up the stretch, as in the single-lever machines already described. David Kirkaldy, who was one of the earliest as well as one of the most assiduous workers in this field, applied in his 1,000,000 lb machine a horizontal hydraulic press directly to one end of the horizontal test-piece. The other end of the piece was connected to the short vertical arm of a bell-crank lever; the long arm of this lever was horizontal, and was connected to a second lever to which weights were applied.

Machines have been employed in which one end of the specimen is held in a fixed support; an hydraulic press acts on the other end, and the stress is calculated from the pressure of fluid in the press, this being observed by a pressure-gauge. Machines of this class are open to the obvious objection that the friction of the hydraulic plunger causes a large and very uncertain difference between the force exerted by the fluid on the plunger and the force exerted by the plunger on the specimen. It appears, however, that in the ordinary conditions of packing the friction is very nearly proportional to the fluid pressure, and its effect may therefore be allowed for with some exactness. The method is not to be recommended for work requiring precision, unless the plunger be kept in constant rotation on its own axis during the test, in which case the effects of friction are almost entirely eliminated.

Diaphragm Testing Machines.—In another class of testing machines the stress (applied as before to one end of the piece, by gearing or by hydraulic pressure) is measured by connecting the other end to a flexible diaphragm, on which a liquid acts whose pressure is determined by a gauge. Fig. 9 shows

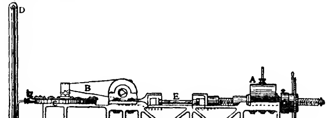

FIG. 9.

Thomasset's testing machine, in which one end of the specimen is pulled by an hydraulic press A. The other end acts through a bell-crank lever B on a horizontal diaphragm C, consisting of a metallic plate and a flexible ring of india-rubber. The pressure on the diaphragm causes a column of mercury to rise in the gauge-tube D. The same principle is applied in the remarkable testing machine of Watertown arsenal, built in 1879 by the U.S. government to the designs of A. H. Emery. This is a horizontal machine, taking specimens of any length up to 30 ft., and exerting a pull of 360 tons or a push of 480 tons by an hydraulic press at one end. The stress is taken at the other end by a group of four large vertical diaphragm presses, which communicate by small tubes with four similar small diaphragm presses in the scale case. The pressure of these acts on a system of levers which terminates in the scale beam. The joints and bearings of all the levers are made frictionless by using flexible steel connecting-plates instead of knife-edges. The total multiplication at the end of the scale beam is 420,000.[2]

Stress-strain Diagrams.—The results of tests are very commonly exhibited by means of stress-strain diagrams, or diagrams showing the relation of strain to stress. A few typical diagrams for wrought iron and steel in tension are given in fig. 10, the data for which are taken from tests of long rods by Kirkaldy.[3] Up to the elastic limit these diagrams show sensibly the same rate of extension for all the materials to which they refer. Soon after the limit of elasticity is passed, a point, which has been called by Sir A. B. W. Kennedy the yield-point, is reached,

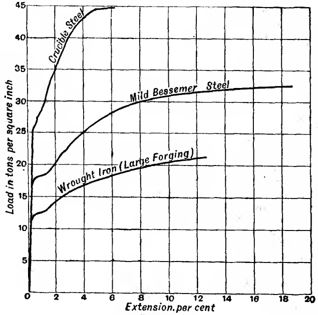

FIG. 10.

which is marked by a very sudden extension of the specimen. After this the extension becomes less rapid; then it continues at a fairly regular and gradually increasing rate; near the point of rupture the metal again begins to draw out rapidly. When this stage is reached rupture will occur through the flow of the metal, even if the load be somewhat decreased. The diagram may in this way be made to come back towards the line of no load, by withdrawing a part of the load as the end of the test is approached.

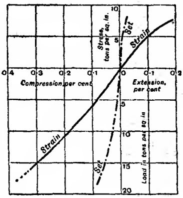

FIG. 11.

Fig. 11 is a stress-strain diagram for cast iron in extension and compression, taken from Eaton Hodgkinson's experiments.[4] The extension was measured on a rod 50 ft. long; the compression was also measured on a long rod, which

was prevented from buckling by being supported in a trough with partitions. The full line gives the strain produced by loading; it is continuous through the origin, showing that Young's modulus is the same for pull and push. (Similar experiments on wrought iron and steel in extension and compression have given the same result.) The broken line shows the set produced by each load. Hodgkinson found that some set could be detected after even the smallest loads had been applied. This is probably due to the existence of initial internal stress in the metal, produced by unequally rapid cooling in different portions of the cast bar. A second loading of the same piece showed a much closer approach to perfect elasticity. The elastic limit is, at the best, ill defined; but by the time the ultimate load is reached the set has become a more considerable part of the whole strain. The pull curves in the diagram extend to the point of rupture; the compression curves are drawn only up to a stage at which the bar buckled (between the partitions) so much as to affect the results.

Autographic Recorders.—Testing machines are sometimes fitted with autographic appliances for drawing strain diagrams. When the load is measured by a weight travelling on a steelyard, the diagram may be drawn by connecting the weight with a drum by means of a wire or cord, so that the drum is made to revolve through angles proportional to the travel of the weight. At the same time another wire, fastened to a clip near one end of the specimen, and passing over a pulley near the other end, draws a pencil through distances proportional to the strain, and so traces a diagram of stress and strain on a sheet of paper stretched round the drum.[1] In Wicksteed's autographic recorder the stress is determined by reference, not to the load on the lever, but to the pressure in the hydraulic cylinder by which stress is applied. The main cylinder is in communication with a small auxiliary hydraulic cylinder, the plunger of which is kept rotating to avoid friction at its packing. This plunger abuts against a spring, so that the distance through which it is pushed out varies with the pressure in the main cylinder. A drum covered with paper moves with the plunger under a fixed pencil, and is also caused to rotate by a wire from the specimen through distances proportional to the strain. The scale of loads is calibrated by occasional reference to the weighted lever.[2] In Kennedy's apparatus autographic diagrams are drawn by applying the stress to the test-piece through an elastic master-bar of larger section. The master-bar is never strained beyond its elastic limit, and within that limit its extension furnishes an accurage measure of the stress; this gives motion to a pencil, which writes on a paper moved by the extension of the test-piece.[3] In R. H. Thurston's pendulum machine for torsion tests, a cam attached to the pendulum moves a pencil through distances proportional to the stress, while a paper drum attached to the other end of the test-piece turns under the pencil through distances proportional to the angle of twist.[4]

Strain beyond the Elastic Limit: Influence of Time.—In testing a plastic material such as wrought-iron or mild steel it is found that the behaviour of the metal depends very materially on the time rate at which stress is applied. When once the elastic limit is passed the full strain corresponding to a given load is reached only after a perceptible time, sometimes even a long time. If the load be increased to a value exceeding the elastic limit, and then kept constant, the metal will be seen to draw out (if the stress be one of pull), at first rapidly and then more slowly. When the applied load is considerably less than the ultimate strength of the piece (as tested in the ordinary way by steady increment of load) it appears that this process of slow extension comes at last to an end. On the other hand, when the applied load is nearly equal to the ultimate strength, the flow of the metal continues until rupture occurs. Then, as in the former case, extension goes on at first quickly, then slowly, but finally, instead of approaching an asymptotic limit, it quickens again as the piece approaches rupture. The same phenomena are observed in the bending of timber and other materials when in the form of beams. If, instead of being subjected to a constant load, a test-piece is set in a constant condition of strain, it is found that the stress required to maintain this constant strain gradually decreases.

The gradual flow which goes on under constant stress—approaching a limit if the stress is moderate in amount, and continuing without limit if the stress is sufficiently great—will still go on at a diminished rate if the amount of stress be reduced. Thus, in the testing of soft iron or mild steel by a machine in which the stress is applied by hydraulic power, a stage is reached soon after the limit of elasticity is passed at which the metal begins to flow with great rapidity. The pumps often do not keep pace with this, and the result is that, if the lever is to be kept floating, the weight on it must be run back. Under this reduced stress the flow continues, more slowly than before, until presently the pumps recover their lost ground and the increase of stress is resumed. Again, near the point of rupture, the flow again becomes specially rapid; the weight on the lever has again to be run back, and the specimen finally breaks under a diminished load. These features are well shown by fig. 12, which is copied from the autographic diagram of a test of mild steel.

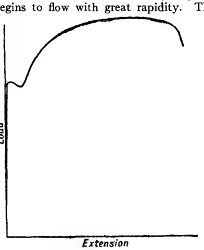

Fig. 12.

Hardening Effect of Permanent Set.—But it is not only through what we may call the viscosity of materials that the time rate of loading affects their behaviour under test. In iron and steel, and probably in some other metals, time has another effect of a very remarkable kind. Let the test be carried to any point a (fig. 13) past the original limit of elasticity. Let the load then be removed; during the first stages of this removal the material continues to stretch slightly, as has been explained above. Let the load then be at once replaced and loading continued. It will then be found that there is a new yield-point b at or near the value of the load formerly reached. The full line bc in fig. 13 shows the subsequent behaviour of the piece. But now let the experiment be repeated on another sample, with this difference, that an interval of time, of a few hours or more, is allowed to elapse after the load is removed and before it is replaced. It will then be found that a process of hardening has been going on during this interval of rest; for when the loading is continued the new yield-point appears, not at b as formerly, but at a higher load d. Other evidence that a change has taken place is afforded by the fact that the ultimate extension is reduced and the ultimate strength is increased (e, fig. 13).

A similar and even more marked hardening occurs when a load (exceeding the original elastic limit), instead of being removed and replaced, is kept on for a sufficient length of time without change. When loading is resumed a new yield-point

[1] For descriptions of these and other types of autographic recorder, see a paper by Professor W. C. Unwin, "On the Employment of Autographic Records in Testing Materials," *Journ. Soc. Arts* (Feb., 1886); also Sir A. B. W. Kennedy's paper, "On the Use and Equipment of Engineering Laboratories," *Proc. Inst. Civ. Eng.* (1886), which contains much valuable information on the whole subject of testing and testing machines. On the general subject of tests see also Adolf Martens's *Handbook of Testing Materials*, trans. by G. C. Henning.

[2] *Proc. Inst. Mech. Eng.* (1886). An interesting feature of this apparatus is a device for preventing error in the diagram through motion of the test-piece as a whole.

is found only after a considerable addition has been made to the load. The result is, as in the former case, to give greater ultimate strength and less ultimate elongation. Fig. 14 exhibits two experiments of this kind, made with annealed iron wire. A

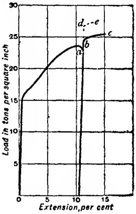

FIG. 13.

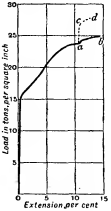

FIG. 14.

load of $23\frac{1}{2}$ tons per square inch was reached in both cases; *ab* shows the result of continuing to load after an interval of five minutes, and *acd* after an interval of $45\frac{1}{2}$ hours, the stress of $23\frac{1}{2}$ tons being maintained during the interval in both cases.[1]

It may be concluded that, when a piece of metal has in any way been overstrained by stress exceeding its limits of clasticity, it is hardened, and (in some cases at least) its physical properties go on slowly changing for days or even months. Instances of the hardening effect of permanent set occur when plates or bars are rolled cold, hammered cold, or bent cold, or when wire is drawn. When a hole is punched in a plate the material contiguous to the hole is severely distorted by shear, and is so much hardened in consequence that when a strip containing the punched hole is broken by tensile stress the hardened portion, being unable to extend so much as the rest, receives an undue proportion of the stress, and the strip breaks with a smaller load than it would have borne had the stress been uniformly distributed. This bad effect of punching is especially noticeable in thick plates of mild steel. It disappears when a narrow ring of material surrounding the hole is removed by means of a rimer, so that the material that is left is homogeneous. Another remarkable instance of the same kind of action is seen when a mild-steel plate which is to be tested by bending has a piece cut from its edge by a shearing machine. The result of the shear is that the metal close to the edge is hardened, and, when the plate is bent, this part, being unable to stretch like the rest, starts a crack or tear which quickly spreads across the plate on account of the fact that in the metal at the end of the crack there is an enormously high local intensity of stress. By the simple expedient of planing off the hardened edge before bending the plate homogeneity is restored, and the plate will then bend without damage.

Annealing.—The hardening effect of overstrain is removed by the process of annealing, that is, by heating to redness and cooling slowly. In the ordinary process of rolling plates or bars of iron or mild steel the metal leaves the rolls at so high a temperature that it is virtually annealed, or pretty nearly so. The case is different with plates and bars that are rolled cold: they, like wire supplied in the hard-drawn state (that is, without being annealed after it leaves the draw-plate), exhibit the higher strength and greatly reduced plasticity which result from permanent set.

Extensometers.—Much attention has been paid to the design of extensometers, or apparatus for observing the small deformation which a test-piece in tension or compression undergoes before its limit of elasticity is reached. Such observations afford the most direct means of measuring the modulus of longitudinal elasticity of the material, and they serve also to determine the limits within which the material is elastic. In such a material as wrought iron the elastic extension is only about $\frac{1}{12000}$ of the length for each ton per square inch of load, and the whole amount up to the elastic limit is perhaps $\frac{1}{1000}$ of the length; with a length of 8 in., which is usual in tensile tests, it is desirable to read the extension to, say, $\frac{1}{50000}$ in. if the modulus of elasticity is to be found with fair accuracy, or if the limits of proportionality between strain to stress are under examination. Measurements taken between marks on one side of the bar only are liable to be affected by bending of the piece, and it is essential either to make independent measurements on both sides or to measure the displacement between two pieces which are attached to the bar in such a manner as to share equally the strain on both sides.

In experiments carried out by Bauschinger, independent measurements of the strains on both sides of the bar were made by using mirror micrometers of the type illustrated diagrammatically in fig. 15. Two clips *a* and *b* clasp the test-piece at the place between

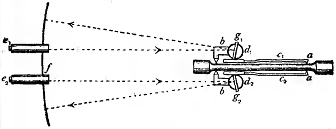

FIG. 15.

which the extension is to be measured. The clip *b* carries two small rollers d_1 d_2 which are free to rotate on centres fixed in the clip. These rollers press on two plane strips c_1 c_2 attached to the other clip. When the specimen is stretched the rollers consequently turn through angles proportional to the strain, and the amount of turning is read by means of small mirrors g_1 and g_2, fixed to the rollers, which reflect the divisions of a fixed scale *f* into the reading telescopes e_1 e_2. In Martens's extensometer each of the rollers is replaced by a rhombic piece of steel with sharp edges, one of which bears against the test-piece, while the other rests in a groove formed in the spring projecting parallel to the test-piece from the distant clip. Much

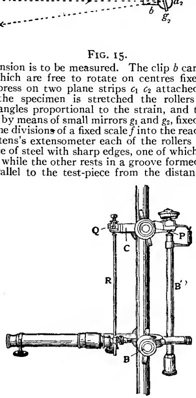

FIG. 16.

excellent work has been done by extensometers of this class, but in point of convenience of manipulation it is of great advantage to have the apparatus self-contained. J. A. Ewing has introduced a microscope extensometer of the self-contained type which is shown in fig. 16; its action will be seen by reference to the diagram fig. 17. Two clips B and C are secured on the bar, each by means of a pair of opposed set-screws. Between the two is a rod B′ which is hinged to B and has a blunt pointed upper end which makes a ball-and-socket joint with C at P. Another bar R hangs from C, and carries a mark which is read by a microscope attached to B. Hence, when the specimen stretches, the length of B′ being fixed, the bar R is pulled up relatively to the microscope, and the amount of the movement is measured by a micrometer scale in the eyepiece. A screw at P serves to bring the mark on R into

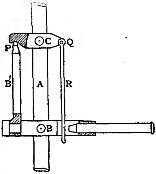

FIG. 17.

[1] J. A. Ewing, *Proc. Roy. Soc.* (June, 1880).

the field of view, and also to calibrate the readings of the micrometer scale. The scale allows readings to be taken to $\frac{1}{50000}$ in., by estimating tenths of the actual divisions. The arms CP and CQ are equal, and hence the movement of Q represents twice the extension of the bar under test. In another form of the instrument adapted to measure the elastic compression of short blocks the arm CQ is four times the length of CP, and consequently there is a mechanical magnification of five besides the magnification afforded by the microscope.

When the behaviour of specimens of iron, steel, or other materials possessing plasticity, is watched by means of a sensitive extensometer during the progress of a tensile test, it is in general observed that a very close proportionality between the load and the extension holds during the first stages of the loading, and that during these stages there is little or no "creeping" or supplementary extension when any particular load is left in action for a long time. The strain is a linear function of the stress, almost exactly, and disappears when the stress is removed. In other words, the material obeys Hooke's law. This is the stage of approximately perfect elasticity, and the elastic limit is the point rather vaguely defined by observations of the strain, at which a tendency to creep is first seen, or a want of proportionality between strain and stress. "Creeping" is usually the first indication that it has been reached. As the load is further augmented, there is in general a clearly marked yield-point, at which a sudden large extension ensues. In metals which have been annealed or in any way brought into a condition which is independent of the effects of earlier applications of stress, this elastic stage is well marked, and the limit of elasticity is as a rule sharply defined. But if the metal has been previously overstrained, without having had its elasticity restored by annealing or other appropriate treatment, a very different

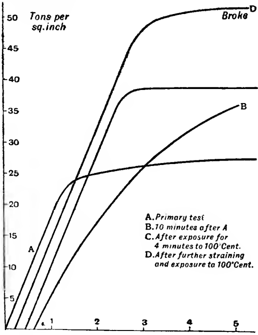

FIG. 18.

behaviour is exhibited. The yield-point may be raised, as, for instance, in wire which has been hardened by stretching, but the elasticity is much impaired, and it is only within very narrow limits, if at all, that proportionality between stress and strain is found. Subsequent prolonged rest gradually restores the elasticity. and after a sufficient number of weeks or months the metal is found to be elastic up to a point which may be much higher than the original elastic limit.[1] It has been shown by J. Muir [2] that the rate at which this recovery of elasticity occurs depends on the temperature at which the piece is kept, and that complete recovery may be produced in iron or steel by exposure of the overstrained specimen for a few minutes to the temperature of boiling water. Figs. 18 and 19 illustrate interesting points in Muir's experiments. In these figures the geometrical device is adopted of shearing back the curves which show extension in relation to load by reducing each of the observed extensions by an amount proportional to the load, namely, by one unit of extension for each 4 tons per square inch of load. The effect is to contract the width of the diagrams, and to make any want of straightness in the curves more evident than it would otherwise be. To escape confusion, curves showing successive operations are drawn from separate origins. In the experiment of figs. 18 and 19 the material under test was a medium steel, containing about 0·4% of carbon, which when tested in the usual way showed a breaking strength of 39 tons per square inch with a well-marked elastic limit at about 22 tons. In fig. 18 the line A relates to a test of this material in its primitive condition; the loading was raised to 35 tons so as to produce a condition of severe overstrain. The load was then removed, and in a few minutes it was reapplied. The line B exhibits the effect of this application. Its curved form shows plainly that all approach to perfect elasticity has disappeared, as a consequence of the overstraining. There is now no elastic limit, no range of stress within which Hooke's law applies. With the lapse of time the curve gradually recovers its straightness, and the material, if kept at ordinary atmospheric temperature, would show almost complete recovery in a month or two. But in this instance the recovery was hastened by immersing the piece for four minutes in boiling water, and line C shows that this treatment restored practically perfect elasticity up to a limit as high as the load by which the previous overstraining had been effected. The loading in C was continued past a new yield-point; this made the elasticity again disappear, but it was restored in the same way as before, namely, by a few minutes' exposure to 100° C., and the line D shows the final test, in which the elastic limit has been raised in this manner to 45 tons. Other tests have shown that a temperature of even 50° C. has a considerable influence in hastening the recovery of elasticity after overstrain.

In the non-elastic condition which follows immediately on overstrain the metal shows much hysteresis in the relation of

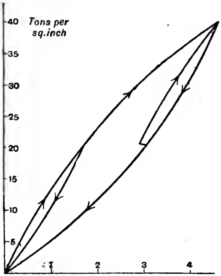

FIG. 19.

strain to stress during any cyclic repetition of a process of loading. This is illustrated in fig. 19, where the arrows indicate the sequence of the operations.

When a piece of iron or steel which has been overstrained in tension is submitted to compression, it shows, as might

[1] See experiments by Johann Bauschinger, *Mitt. aus dem mech-tech. Lab. in München* (1886), and by the writer, *Proc. Roy. Soc.*, vol. xlviii. (1895). A summary of Bauschinger's conclusions will be found in Martens's book, cited above, and in Unwin's *Testing of Materials.*

[2] Muir, "On the Recovery of Iron from Overstrain," *Phil. Trans.* A, vol. 193 (1900).

be expected, no appreach to conformity with Hooke's law until recovery has been brought about either by prolonged rest at ordinary temperature or by exposure for a short time to some higher temperature. After recovery has taken place the elastic limit in compression is found to have been lowered; that is to say, it occurs at a lower load than in a normal piece of the same metal. But it appears from Muir's experiments that the amount of this lowering is not at all equal to the amount by which the elastic limit has been raised in tension. In other words, the general effect of hardening by overstrain, followed by recovery of elasticity, is to widen the range within which a practically complete proportionality between strain and stress holds good.

Contraction of Section at Rupture.—The extension which occurs when a bar of uniform section is pulled is at first general, and is distributed with some approach to uniformity over the length of the bar. Before the bar breaks, however, a large additional amount of local extension occurs at and near the place of rupture. The material flows in that neighbourhood much more than in other parts of the bar, and the section is much more contracted there than elsewhere. The contraction of area at fracture is frequently stated as one of the results of a test, and is a useful

Fig. 20.

index to the quality of materials. If a flaw is present sufficient to determine the section at which rupture shall occur the contraction of area will in general be distinctly diminished as compared with the contraction in a specimen free from flaws, although little reduction may be noted in the total extension of the piece. Local extension and contraction of area are almost absent in cast iron and hard steel; on the other hand, they are specially prominent in wrought iron, mild steel and other metals that combine plasticity with high tensile strength. An example is shown in fig. 20, which is copied from a photograph of a broken test-piece of Whitworth mild fluid-compressed steel. The piece was of uniform diameter before the test.

Experiments with long rods show that the general extension which occurs in parts of the bar not near the break is somewhat irregular;[1] it exhibits here and there incipient local stretching, which has stopped without leading to rupture. This is, of course, due in the first instance to want of homogeneity. It may be supposed that when local stretching begins at any point in the earlier stages of the test it is checked by the hardening effect of the strain, until, finally, under greater load, a stage is reached in which the extension at one place goes on so fast that the hardening effect cannot keep pace with the increase in intensity of stress which results from diminution of area; the local extension is then unstable, and rupture ensues. Even at this stage a pause in the loading, and an interval of relief from stress, may harden the locally stretched part enough to make rupture occur somewhere else when the loading is continued.

Influence of Local Stretching on Total Elongation.—Local stretching causes the percentage of elongation which a test-piece exhibits before rupture (an important quantity in engineers' specifications) to vary greatly with the length and section of the piece tested. It is very usual to specify the length which is to exhibit an assigned percentage of elongation. This, however, is not enough; the percentage obviously depends on the relation of the transverse dimensions to the length. A fine wire 8 in. long will stretch little more in proportion to its length than a very long wire of the same quality. An 8-in. bar, say 1 in. in diameter, will show something like twice as much the percentage of elongation as a very long rod. The experiments of Barba[2] show that, in material of uniform quality, the percentage of extension is constant for test-pieces of similar form, that is to say, for pieces of various size in which the transverse dimensions are varied in the same proportion as the length. It is to be regretted that in ordinary testing it is not practicable to reduce the pieces to a standard form with one proportion of transverse dimensions to length, since tests in which the relation of length to cross-section differ give results which are incapable of direct comparison with one another.

Influence on Strength.—The form chosen for test-pieces in tension tests affects not only the extension but also the ultimate strength. In the first place, if there is a sudden or rapid change in the area of cross-section at any part of the length under tension (as at AB, fig. 21), the stress will not be uniformly distributed there. The intensity will be greatest at the edges A and B, and the piece will, in consequence, pass its elastic limit at a less value of the total load than would be the case if the change from the larger to the smaller section were gradual. In a non-ductile material rupture will for the same reason take place at AB, with a less total load than would otherwise be borne. On the other hand, with a sufficiently ductile material, although the section AB is the first to be permanently deformed, rupture will preferably take place at some section not near AB, because at and near AB the contraction of sectional area which precedes rupture is partly prevented by the presence of the projecting portions C and D. Hence, too, with a ductile material samples such as those of fig. 22, in

Fig. 21.

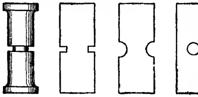

Fig. 22.

which the part of smallest section between the shoulders or enlarged ends of the piece is short, will break with a greater load than could be borne by long uniform rods of the same section. In good wrought iron and mild steel the flow of metal preceding rupture and causing local contraction of section extends over a length six or eight times the width of the piece; and, if the length throughout which the section is uniform be materially less than this, the process of flow will be rendered more difficult and the breaking load of the sample will be raised.[3]

These considerations have, of course, a wider application than to the mere interpretation of special tests. An important practical case is that of riveted joints, in which the metal left between the rivet holes is subjected to tensile stress. It is found to bear, per square inch, a greater pull than would be borne by a strip of the same plate if the strip were tested in the usual way with uniform section throughout a length great enough to allow complete freedom of local flow.[4]

Fracture by Tension.—In tension tests rupture may occur by direct separation over a surface which is nearly plane and normal to the line of stress. This is not uncommon in hard steel and other comparatively non-ductile materials. But in ductile materials under tension the piece generally gives way by shearing on an inclined surface. Very often the effect is a more or less perfect ring-shaped crater on one side of the break and a truncated cone on the other.

[1] See Kirkaldy's *Experiments on Fagersta Steel* (London, 1873).

[2] *Mém. de la soc. des ing. civ.* (1880); see also a paper by W. Hackney, "On the Adoption of Standard Forms of Test-Pieces," *Proc. Inst. Civ. Eng.* (1884).

[3] The greater strength of nicked or grooved specimens seems to have been first remarked by Kirkaldy (*Experiments on Wrought Iron and Steel*, p. 74, also *Experiments on Fagersta Steel*, p. 27). See also a paper by E. Richards, on tests of mild steel, *Journ. Iron and Steel Inst.* (1882).

[4] See Kennedy's "Reports on Rivetted Joints," *Proc. Inst. Mech. Eng.* (1881–1885). In the case of mild-steel plates a drilled strip may have as much as 12% more tensile strength per square inch than an undrilled strip. With punched holes, on the other hand, the remaining metal is much weakened, for the reason referred to in the text.

Fracture by Compression.—In compression tests of a plastic material, such as mild steel, a process of flow may go on without limit; the piece (which must of course be short, to avoid buckling) shortens and bulges out in the form of a cask. This is illustrated by fig. 23 (from one of Sir W. Fairbairn's experiments), which shows the compression of a round block of steel (the original height and diameter of which are shown by the dotted lines) by a load equal to 100 tons per sq. in. of original sectional area. The surface over which the stress is distributed becomes enlarged, and the total load must be increased in a corresponding degree to maintain the process of flow.[1] The bulging often produces longitudinal cracks, as in the figure, especially when the material is fibrous as well as plastic (as in the case of wrought iron). A brittle material, such as cast iron, brick or stone, yields by shearing on inclined planes as in figs. 24 and 25, which are taken from Hodgkinson's experiments on cast iron.[2] The simplest fracture of this kind is exemplified by fig. 24, where a single surface (approximately a plane) of shear divides the compressed block into two wedges. With cast iron the slope of the plane is such that this simplest mode of fracture can take place only if the height of the block is not less than about $\frac{3}{2}$ the width of the base. When the height is less the action is more complex. Shearing must then take place over more than one plane, as in fig. 25, so that cones or wedges are formed by which the surrounding portions of the block are split off. The stress required to crush the block is consequently greater than if the height were sufficient for shearing in a single plane.

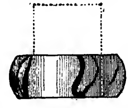

FIG. 23.

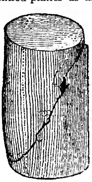

FIG. 24.

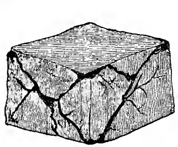

FIG. 25.

Plane of Shear.—The inclination of the surfaces of shear, when fracture takes place by shearing under a simple stress of pull or push, is a matter of much interest, throwing some light on the question of how the resistance which a material exerts to stress of one kind is affected by the presence of stress of another kind—a question scarcely touched by direct experiment. At the shorn surface there is, in the case of tension tests, a normal pull as well as a shearing stress, and in the case of compression tests a normal push as well as shearing stress. If this normal component were absent the material (assuming it to be isotropic) would shear in the surface of greatest shearing stress, which, as has already been shown, is a surface inclined at 45° to the axis. In fact, however, it does not shear on this surface. Hodgkinson's experiments on the compression of cast iron give surfaces of shear whose normal is inclined at about 55° to the axis of stress, and Kirkaldy's, on the tension of steel, show that when rupture of a rod under tension takes place by shear the normal to the surface is inclined at about 25° to the axis. These results show that normal pull diminishes resistance to shearing and normal push increases resistance to shearing. In the case of cast iron under compression, the material prefers to shear on a section where the intensity of shearing stress is only 0·94 of its value on the surface of maximum shearing stress (inclined at 45°), but where the normal push is reduced to 0·66 of the value which it has on the surface of maximum shearing stress.

Lüders's Lines.—It is interesting to refer in this connexion to the phenomenon observed in 1859 by W. Lüders[3] of Magdeburg and afterwards studied more fully by L. Hartmann.[4] When a bar of plastic metal such as mild steel, preferably flat and with a polished surface, is extended a little beyond its elastic limit, markings appear on the surface in the form of narrow bands running transversely across it. These bands are regions within which a shearing deformation has taken place, resulting from the tension, as has been explained with reference to fig. 1, and they are distinguished from the remainder of the bar because in the early stages of plastic strain the yielding is local. For the reason that has just been explained in speaking of surfaces of rupture, Lüders's lines in a rod strained by direct pull are found to be inclined, not at 45°, but at an angle more nearly normal to the axis of pull (making about 65° with it). Their inclination shows that the metal prefers to elongate by shearing on a section where p_t the shearing stress is not at its maximum, because p_n the normal component—which is a pull—is greater there, and this can only mean that the presence of a normal component of the nature of a pull at any section reduces the resistance to yielding under the shearing stress which acts at that section, while similarly the presence of a normal component of the nature of a push increases the resistance to shear.

Yielding under Compound Stress.—A question of much theoretical interest and also of some practical importance is, what determines the yielding of a piece when it is subjected not to a simple pull or push alone but to a stress combined of two or of three principal stresses? According to one view, which in the absence of experimental data appears to have been taken by W. J. M. Rankine, the material yields when the greatest principal stress reaches a certain limit, irrespective of the existence of the other principal stresses. According to another view (Barré de Saint-Venant), it yields when the maximum strain reaches a certain limit, and as the strain depends in part on each of the three principal stresses this gives a different criterion. Neither the maximum stress theory nor the maximum strain theory can be regarded as satisfactory, and probably a much sounder view is that the material yields when the greatest shearing stress reaches a certain limit. Even this, however, requires some qualification in the light of what has just been said about the inclination of surfaces of shear and Lüders's lines, for it is clear from these experimental indications that resistance to shear is affected by the presence of normal stress on the plane of shear, and consequently a theory which takes account of shearing stress only as the criterion of yielding cannot be completely correct. According to the greatest shearing stress theory the yielding under compound stress depends directly on the difference between the greatest and least principal stress. In such cases of compound stress as have to be dealt with in engineering design this furnishes a criterion which though imperfect is certainly to be preferred to the criterion furnished by calculating the greatest principal stress.

Experiments on Compound Stress.—In experiments carried out by J. J. Guest (*Phil. Mag.*, 1900, vol. 50) the action of combined stresses in causing yielding was investigated by subjecting thin tubes to (1) tension alone, (2) tension and torque, (3) tension and internal (fluid) pressure, and (4) torque and internal pressure, while measurements were made of the axial strain and the twist so as to detect the first failure of elasticity. The general result of the experiments, so far as they went, was to support the view that yielding depends primarily on the greatest shearing stress, that is to say, on the difference between the greatest and least principal stresses.

Fatigue of Metals.—A matter of great practical as well as scientific interest is the destructive action which materials

[1] For examples, see Fairbairn's experiments on steel, *Brit. Assoc. Rep.* (1867).

[2] *Report of the Royal Commissioners on the Application of Iron to Railway Structures* (1849); see also *Brit. Assoc. Rep.* (1837).

[3] *Dingler's Polytech. Journ.* (1860), 155, p. 18.

[4] *Bulletin de la société d'encouragement* (1896 and 1897).

may suffer through repeated changes in their state of stress. It appears that in some if not in all materials a limited amount of stress-variation may be repeated time after time without appreciable deterioration in the strength of the piece; in the balance-spring of a watch, for instance, tension and compression succeed each other some 150 millions of times in a year, and the spring works for years without apparent injury. In such cases the stresses lie well within the elastic limits. On the other hand, the toughest bar breaks after a small number of bendings to and fro, when these pass the elastic limits, although the stress may have a value greatly short of the normal ultimate strength. A laborious research by A. Wöhler,[1] extending over twelve years, gave much important information regarding the effects on iron and steel of very numerous repeated alternations of stress from positive to negative, or between a higher and a lower value without change of sign. By means of ingeniously-contrived machines he submitted test-pieces to direct pull, alternated with complete or partial relaxation from pull, to repeated bending in one direction and also in opposite directions, and to repeated twisting towards one side and towards opposite sides. The results show that a stress greatly less than the ultimate strength (as tested in the usual way by a single application of load continued to rupture) is sufficient to break a piece if it be often enough removed and restored, or even alternated with a less stress of the same kind. In that case, however, the variation of stress being less, the number of repetitions required to produce rupture is greater. In general, the number of repetitions required to produce rupture is increased by reducing the range through which the stress is varied, or by lowering the upper limit of that range. If the greatest stress be chosen small enough, it may be reduced, removed, or even reversed many million times without destroying the piece. Wöhler's results are best shown by quoting a few figures selected from his experiments. The stresses are stated in centners per square zoll;[2] in the case of bars subjected to bending they refer to the top and bottom sides, which are the most stressed parts of the bar.

I. Iron bar in direct tension:—

Stress. Max.	Stress. Min.	Number of Applications causing Rupture.	Stress. Max.	Stress. Min.	Number of Applications causing Rupture.
480	0	800	320	0	10,141,645
440	0	106,901			
400	0	340,853	440	200	2.373,424
360	0	480,852	440	240	Not broken with 4 millions.

II. Iron bar bent by transverse load:—

Stress. Max.	Stress. Min.	Number of Bendings causing Rupture.	Stress. Max.	Stress. Min.	Number of Bendings causing Rupture.
550	0	169.750	400	0	1,320,000
500	0	420,000	350	0	4,035,400
450	0	481,950	300	0	Not broken with 48 millions.

III. Steel bar bent by transverse load:—

Stress. Max.	Stress. Min.	Number of Bendings causing Rupture.	Stress. Max.	Stress. Min.	Number of Bendings causing Rupture.
900	0	72,450	900	400	225,300
900	200	81,200	900	500	764,900—mean of two trials.
900	300	156,200	900	600	Not broken with 33½ millions.

IV. Iron bar bent by supporting at one end, the other end being loaded; alternations of stress from pull to push caused by rotating the bar:—

Stress. From + to −	Number of Rotations causing Rupture.	Stress. From + to −	Number of Rotations causing Rupture.
320	56,430	220	3,632,588
300	99,000	200	4,917,992
280	183,145	180	19,186,791
260	479,490	160	Not broken with 132¼ millions.
240	909,810		

From these and other experiments Wöhler concluded that the wrought iron to which the tests refer could probably bear an indefinite number of stress changes between the limits stated (in round numbers) in the following table (the ultimate tensile strength was about 19½ tons per sq. in.):—

	Stress in Tons per Sq. In.
From pull to push	+7 to −7
From pull to no stress	13 to 0
From pull to less pull	19 to 10½

[1] *Die Festigkeits-Versuche mit Eisen und Stahl* (Berlin, 1870), or *Zeitschr. für Bauwesen* (1860–1870); see also *Engineering* (1871), vol. xi. For early experiments by Fairbairn on the same subject, see *Phil. Trans.* (1864).

[2] According to Bauschinger the centner per square zoll in which Wöhler gives his results is equivalent to 6·837 kilos per sq. cm., or 0·0434 ton per sq. in.

Hence it appears that the actual strength of this material varies in a ratio which may be roughly given as 3 : 2 : 1 in the three cases of (*a*) steady pull, (*b*) pull alternating with no stress, very many times repeated, and (*c*) pull alternating with push, very many times repeated. For steel Wöhler obtained results of a generally similar kind. His experiments were repeated by L. Spangenberg, who extended the inquiry to brass, gun-metal and phosphor-bronze.[3] A considerable amount of light has been thrown on the nature of fatigue in metals by miscroscopic investigations, which will be referred to presently.

Resilience.—A useful application of diagrams showing the relation of strain to stress is to determine the amount of work done in straining a piece in any assigned way. The term "resilience" is conveniently used to specify the amount of work done when the strain just reaches the corresponding elastic limit. Thus a rod in simple tension or simple compression has a resilience per unit of volume $= f^2/2E$, where f is the greatest elastic pull or push. A blow whose energy exceeds the resilience (reckoned for the kind of stress to which the blow gives rise) must in the most favourable case produce a permanent set; in less favourable cases local permanent set will be produced although the energy of the blow is less than the resilience, in consequence of the strain being unequally distributed. In a plastic material a strain exceeding the limit of elasticity absorbs a relatively large amount of energy, and generally increases the resilience for subsequent strains. Fracture under successive blows, as in the testing of rails by placing them as beams on two supports, and allowing a weight to fall in the middle from a given height, results from the accumulated set which is brought about by the energy of each blow exceeding the resilience.

Internal Stress.—Professor James Thomson[4] pointed out that the effect of any externally applied load depends, to a very material extent, on whether there is or is not initial internal stress, or, in other words, whether the loaded piece is initially in what Professor Karl Pearson has called a state of ease. Internal stress existing without the application of force from without the piece must satisfy the condition that its resultant vanishes over any complete cross-section. It may exist in consequence of set caused by previously applied forces (a case of which instances are given below), or in consequence of previous temperature changes, as in cast iron, which is thrown into a state of internal stress by unequally rapid cooling of the mass. Thus in (say) a spherical casting an outside shell solidifies first, and has become partially contracted by cooling by the time the inside has become solid. The inside then contracts, and its contraction is resisted by the shell, which is thereby compressed in a tangential direction, while the metal in the interior is pulled in the direction of the radius. Allusion has already been made to the fact, pointed out by J. Thomson, that the defect of elasticity under small loads which Hodgkinson discovered in cast iron is probably due to initial stress. In plastic metal a nearly complete state of ease is brought about by annealing; even annealed pieces, however, sometimes show, in the first loading, small defects of elasticity, which are probably due to initial stress, as they disappear when the load is reapplied.

Microscopic Examination.—Of all recent aids to a knowledge of the structure of metals, of their behaviour under stress, and of the nature of plastic strain, perhaps the most important is microscopic examination. The microscopic study of metals was initiated by H. C. Sorby as early as 1864 (see *Brit. Assoc. Rep.*

[3] *Ueber das Verhalten der Metalle bei wiederholten Anstrengungen* (Berlin, 1875). For interesting notices of the fatigue of metals in railway axles, bridge ties, &c., and results of experiments showing reduced plasticity in fatigued metal, see Sir B. Baker's address to the Mechanical Section of the British Association (1885). In many of the cases where the fatigue of metals occurs in engineering practice the phenomenon is complicated by the occurrence of blows or shocks whose energy is absorbed in producing strains often exceeding the elastic limits, sometimes of a very local character in consequence of the inertia of the strained pieces. Such shocks may cause an accumulation of set which finally leads to rupture in a way that is not to be confused with ordinary fatigue of strength. The effects of the accumulation may be removed by annealing.

[4] *Camb. and Dub. Math. Journ.* (Nov. 1848).

for that year). After a period of neglect, it has been pursued with much energy by a large number of observers, and has yielded results which are of fundamental importance in relation to the strength of materials. For the purpose of microscopic examination it is usually necessary to bring a small piece of the metal to a state of high surface polish, the final stage of which is performed by rubbing on a surface of wash-leather charged with a thin paste of rouge and water (see also METALLOGRAPHY). The specimen is then lightly etched in dilute acid or treated with a staining medium, such as liquorice or cocoa, to make the structure visible. When the surface is examined under a lens of suitable power it is seen to be made up of irregular areas with well-defined boundaries. The areas into which the surface is divided differ in apparent texture, and when illuminated obliquely it is found that some of them shine out brightly while others are dark; by changing the direction of the incident light other areas become bright and those previously bright become dark. These areas are the sections of crystalline grains which constitute the mass of the metal. Each grain is a crystal, the elementary portions of which are all oriented one way, but the orientation changes as we pass from grain to grain. The irregular boundaries are the chance surfaces in which one grain meets another during the progress of its crystalline growth. Etching a polished surface develops a multitude of facets which have the same orientation over any one grain, and therefore give it a uniform texture and a uniform brightness in reflecting light of any particular incidence. The size of the grains depends very much upon the previous thermal treatment to which the metal has been subjected. Sudden cooling from a high temperature tends to make the grains small, slow cooling tends to keep them large; and protracted exposure to moderately high temperature has been observed in some cases to favour the growth of very large grains.

When the metal is strained in any manner beyond its limit of elasticity the grains are found to have altered their shape, becoming lengthened in the direction in which stretch has occurred. Subsequent exposure to a temperature which is high enough to remove the mechanical hardness produced by overstraining is found to bring about a reconstruction of the grains; the original pattern is not reproduced, but the reformed grains show no direction of predominating length. Researches by J. A. Ewing and W. Rosenhain ("The Crystalline Structure of Metals," *Phil. Trans.*, 1900) showed that metals retain their crystalline character even when so severely strained as to exhibit qualities of plasticity which are at first sight inconsistent with the idea of crystalline structure. The manner in which a metal yields when the strain exceeds the elastic limit is by slips which occur in the cleavage or "gliding" planes of the individual crystals. These slips are seen under the microscope as sharply defined lines which appear on the polished surface of each grain as soon as the yield-point in any process of straining has been

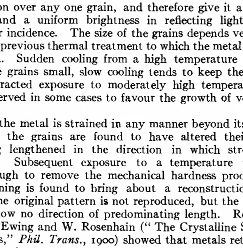

FIG. 26.

reached. Seen under normal illumination the lines are dark; seen under oblique illumination they may be made to appear as bright lines on a dark ground. The appearance of each line shows that it is a narrow step produced by the slipping of one part of the crystalline grain over another part. The diagram fig. 26 represents a section between two contiguous surface grains, having cleavage or gliding planes as indicated by the dotted lines, AB being a part of the polished surface. When straining beyond the elastic limit takes place, as by a pull in the direction of the arrows, yielding occurs by finite amounts of slip at a limited number of places, as at *a*, *b*, *c*, *d*, *e*. This exposes short steps, which are portions of cleavage surfaces, and which, when viewed under normally incident light, appear black because they return no light to the microscope. They consequently appear as dark lines or narrow bands extending over the polished surface in directions which depend on the intersection of that surface with the planes of slip. Many such lines appear as the process of straining goes on; they are spaced at more or less regular intervals, and in general three systems of them may be observed intersecting one another. With three independent systems of slips it is clear that the grain may take any shape in the process of straining; in many cases four systems of slips are seen. In this way severe deformations occur without affecting the crystalline character of the structure, although the shape of each crystal undergoes much change. A bar of iron which has been rolled cold from a large to a small section shows, when it is polished and etched, a structure in which each grain has all the characteristics of a crystal, although the grains have been distorted into forms very different from those which are found in bars which are rolled at a red heat or are annealed after rolling. It appears that the process of straining has occurred through movements which preserve the parallelism of all the portions of each individual grain so long as continuity of the parts of the grain is preserved. In many metals, however, a further effect of severe strain is to develop twin crystals, and this implies a rotation of one group of elements through a definite angle with respect to the other elements of the same grain. Excessively severe straining, as, for instance, the squeezing of a block of lead into a thin flat plate, is found to produce a crystalline structure in which the grains have a greatly reduced size; the slips have in that case gone so far as to cause divisions and interpenetrations of the crystals.

Growth of Crystals.—Microscopic examination further shows that after severe straining the structure of a metal is far from stable, a fact which connects itself with what is observed in respect to mechanical quality. In some metals at least, and notably in lead, severe straining is followed, even at atmospheric temperatures, by a protracted crystalline growth which results in the formation of crystals which are relatively very large. A piece of ordinary sheet lead shows the effects of this growth well; it will be found, when etched, to consist in general of crystals enormously larger than any that could have survived the process of manufacture by rolling. A similar growth may readily be traced from day to day or week to week in a piece of lead which is kept under observation after being severely strained. The process of growth is greatly accelerated by raising the temperature. That some process more or less analogous to this goes on in iron and steel during the change which occurs when elastic recovery takes place after overstraining may be conjectured, though there is as yet no direct evidence on the point. The growth of large crystals which is seen to occur in lead at very moderate temperatures has perhaps a more direct relation to the changes which occur in iron or steel at temperatures high enough to produce annealing. The structure of steel as exhibited by the microscope has received much attention, notably at the hands of F. Osmond and J. O. Arnold. Microscopic examination of the low or medium carbon steel used for structural purposes shows it to consist of grains of iron (ferrite), interspersed with grains which have in general a laminated structure and are composed of alternate bands of two constituents, namely, iron and carbide of iron (Fe_3C). To these laminated grains the name of pearlite has been given. In steel such as is used for rails, containing about 0·4 or 0·5% of carbon, the grains of pearlite occupy about as large a volume of the specimen as the grains of unlaminated ferrite; but when the proportion of carbon is increased to about 0·9% the whole is a mass of pearlite having an exceedingly intimate mixture of the two constituents. This appears to be a eutectic alloy, and the same intimately blended structure is characteristic of eutectic alloys generally. Important variations in the visible structure result from quenching, annealing, and other varieties of thermal treatment, as well as from the presence of other constituents in the steel, but to discuss these would be beyond the scope of the present article.

In experiments by Ewing and J. C. W. Humfrey ("The Fracture of Metals under repeated Alternations of Stress," *Phil. Trans.*, 1903) the microscope was employed to examine the process by which metals break through "fatigue" when subjected to repeated reversals of stress. The test-pieces were short rods overhanging from a revolving mandrel and loaded at the end so as to produce a bending moment. A part near the support, where the stresses due to bending were greatest, was polished beforehand for observation in the microscope. After a certain number of reversals the surface was examined, and the examination was repeated at intervals as the process continued. The material was Swedish iron following Hooke's law (in tension) up to 13 tons per sq. in. and having a well-marked yield-point at 14·1 tons per sq. in. It was found that the material suffered no damage from repeated reversals of a stress of 5 tons per sq. in., but that when the greatest stress was raised to 7 tons per sq. in. incipient signs of fatigue began to be apparent after many reversals, though the piece was still intact after the number of reversals had reached three millions. With a stress of 9 tons per sq. in., or more, repeated reversals brought about fracture. The first sign of fatigue as detected in the microscope was that slip lines began to appear on one or more of the crystals in the region of greatest stress: as the process went on these became more distinct and tended to broaden, and at length some of them developed into cracks which were identified as such because they did not disappear when the surface was repolished. Once a crack had formed it quickly spread, and finally the piece broke with a sharp fracture, showing practically no plastic change of form before rupture.

It may be concluded that under repeated alternations of stress fatigue, leading to fracture, is liable to occur if, and only if, the stress is such as to produce slips in some of the crystals: in other words if, and only if, the limit of elasticity is *locally* exceeded; but the limit for particular crystals may be considerably lower than what is usually taken as the limit for the metal as a whole. The resistance to slip in any one crystal depends on three things: (1) the inherent strength of its own substance, (2) the amount of support it receives from its neighbours, and (3) the orientation of the crystal with respect to the surfaces of maximum shearing stress. It may be inferred that even in the most homogeneous metal some crystals have a liability to develop slips more readily than others, and that it is with them we are concerned in dealing with the safe limits of alternating stress. The same considerations have a bearing on certain effects of heat treatment. It is well known that in steel which has been overheated (by unnecessarily prolonged exposure to a high temperature) a somewhat gross crystalline structure is developed, showing large ferrite areas not broken up by intermixture with pearlite. The resistance to slip in the large ferrite crystals is comparatively small, and hence the overheated metal has a low elastic limit and shows but little power of resisting alternating stress. By suitable heat treatment, on the other hand, it is possible to bring the metal into a state in which the crystals are small and the ferrite and pearlite are so intimately blended that there is much mutual support: the elastic limit is high and the metal is well adapted to endure stresses which would otherwise cause fatigue.

It may be asked, How is the crystal constituted to admit of elastic and plastic strain? How can slip take place without destroying the adhesion between the faces until that is destroyed by many back and forth rubbings at the surface of slip? J. A. Ewing has endeavoured to picture a molecular constitution in which the molecules are assumed to possess polar quality along three axes, and to be free to turn except in so far as they are constrained by the mutual forces between the pole of each molecule and those of its neighbours. This theory, which was developed by its author in his presidential address to the engineering section of the British Association in 1906, accords well with many of the obscure phenomena of elastic and plastic strain, with what is known of fatigue, and with the loss of elasticity after overstrain and its subsequent recovery.

Influence of Foreign Matter.—It is a well-known characteristic of metals that small quantities of foreign matter may produce an altogether disproportionately large influence on their mechanical and other properties. The effect of small quantities of carbon in iron, of nickel in iron, of aluminium in copper, are important practical instances where a highly beneficial effect, in respect of strength and ductility, is produced. The wide and varied range of qualities possessed in steel from pure iron at one end to tool steel at the other is due to quantities of carbon which lie, for the most part, under 1%. The addition of about 3 or 4% of nickel to mild steel has given an important new structural material possessing increased strength and a high elastic limit, and retaining ample capacity for plastic strain. The presence of manganese in small quantities is known to be an essential condition of strength in mild steel. The addition of from $1\frac{1}{2}$ to 3% of chromium enables steel to acquire, under suitable heat treatment, the excessive hardness desirable in armour plate and armour-piercing shell. Small quantities of vanadium added to steel improve it sufficiently to be advantageous in certain applications where saving of weight is important, notably in steel for motor carriage engines, notwithstanding the extra cost.

Data as to Strength of Steel.—A few figures may be quoted as to the strength and plasticity of steel, some of which are taken from the reports of the Engineering Standards Committee (1906–1907) specifying tests to which the material should conform.

Ordinary plates and bars of mild steel for structural purposes (bridges, ships, &c.), containing as a rule not more than 2% of carbon, have a tensile strength of 28 to 32 tons per sq. in., and an 8-in. specimen with a cross-section of from $\frac{3}{4}$ to $1\frac{1}{2}$ sq. in. should stretch at least 20%. They should stand being bent cold through 180° on a radius $1\frac{1}{2}$ times the thickness of the specimen, the test-piece for bending being not less than $1\frac{1}{2}$ in. wide. Rivet bars, of somewhat softer steel, have a tensile strength of 26 to 30 tons, with 25% of elongation on 8 in. Steel rails, containing 0·4 or 0·5% of carbon, have a tensile strength of 38 to 48 tons and stretch 15% on a 2-in. length, the area of section of the test-piece being $\frac{1}{4}$ sq. in. Steel for axles has a tensile strength of 35 to 40 tons and stretches 25 to 30% on the 2-in. length. The elastic limit should be at least 50% of the breaking load. Steel for tires may in some cases have a tensile strength as high as 60 tons with about 8 to 10% extension in 2 in. Steel castings commonly range in tensile strength from 26 to 35 tons, with about 15% extension in 2 in. The strength of steel wire is considerably higher than that of bar or plates: 70 to 100 tons per sq. in. is not unusual, and in steel pianoforte wire it may be as high as 150 tons per sq. in.

Steel for guns, containing generally 0·3 to 0·4% of carbon, has a tensile strength of 33 to 44 tons per sq. in., with at least 17% extension in 2 in., the test-piece having the usual cross-section of $\frac{1}{4}$ sq. in. Nickel steel for guns, containing 0·4% of carbon and 4% nickel, has a strength of 45 to 55 tons and an extension of at least 16% in 2 in. Much the same figures apply to nickel-chrome steel for the same purpose, with 1% of chromium, 4% of nickel and 0·3% of carbon. Flat specimens of gun steel $\frac{3}{4}$ in. wide and 0·375 in. thick stand bending cold through 180° on a radius of $1\frac{1}{2}$ in. All these tests of gun steel are made after forging and after the normal heat treatment, which consists first of oil-hardening by plunging the steel at a temperature not lower than 1500° F. into a bath of oil, and then tempering, by reheating to a temperature generally about 900° to 1000° F. This heat treatment brings the metal into a condition in which the granular structure is minute and the constituents are very thoroughly intermixed, with the result of giving a high elastic limit. Tests made on gun steel containing about 0·35% of carbon show that the yield-point occurred at 18 tons per sq. in. before the heat treatment, and at 25 tons after it, the extension remaining practically unchanged at 30% in 2 in. In nickel steel the yield-point is initially higher, but in it too the heat treatment effects a considerable improvement in this respect without reducing the extension.

It is remarkable that though the strength of wrought iron and steel may range from 20 tons per sq. in., or even less, up to 150 tons, the moduli which measure its elastic quality are nearly the same in all grades. Young's modulus E ranges from about 12,500 to 14,000 tons per sq. in., and the modulus of rigidity C from 5000 to 5700 tons per sq. in.

Graphic Representation of Distributed Stress.—Space admits of no more than a short and elementary account of some of the more simple straining actions that occur in machines and engineering structures.

The stress which acts on any plane surface AB (fig. 27), such as an imaginary cross-section of a strained piece, may be represented by a figure formed by setting up ordinates Aa, Bb, &c., from points on the surface, the length of these being made proportional to the intensity of stress at each point. This gives an ideal solid, which may be called the stress figure, whose height shows the distribution of stress over the surface which forms its base. A line drawn from g, the centre of gravity of the stress figure, parallel to the ordinates Aa, &c., determines the point c, which is called the centre of stress, and is the point through which the resultant of the distributed stress acts. In the case of a uniformly distributed stress, ab is a plane surface parallel to AB, and c is the centre of gravity of the surface AB. When a bar is subjected to simple pull applied axially—that is to say, so that the resultant stress passes through the centre of gravity of every cross-section—the stress may be taken as (sensibly) uniformly distributed over any section not near a place where the form of the cross-section changes, provided the bar is homogeneous in respect of elastic quality and is initially in a state of ease and the stress is within the limits of elasticity.

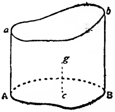

FIG. 27.

Uniformly Varying Stress.—Uniformly varying stress is illustrated by fig. 28. It occurs (in each case for stresses within the elastic limit) in a bent beam, in a tie subjected to non-axial pull, and in a long strut or column where buckling makes the stress become non-axial. In uniformly varying stress the intensity p at any point P is proportional to the distance of P from a line MN, called the neutral axis, which lies in the plane of the stressed surface and at right angles to the direction AB, which is assumed to be that in which the intensity of stress varies most rapidly. There is no variation of stress along lines parallel to MN. If MN passes through C, the centre of gravity of the surface, as in fig. 29, it may easily be shown that the total pull stress on one side of the neutral axis is equal to the total push stress on the other side, whatever be the form of the surface AB. The resultant of the whole stress on AB is in that case a couple, whose moment may be found as follows. Let dS be an indefinitely small part of the surface at a distance x from the neutral axis through C, and let p be the intensity of stress on dS. The moment of the stress on dS is xpdS. But $p = p_1x/x_1 = p_2x/x_2$ (see fig. 29). The whole moment of the stress on AB is $\int xpd\text{S} = (p_1/x_1)\int x^2d\text{S} = p_1\text{I}/x_1$ or $p_2\text{I}/x_2$, where I is the moment of inertia of the surface AB about the neutral axis through C.

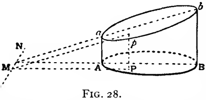

FIG. 28.

FIG. 29.

A stress such as that shown in fig. 28 or fig. 30 may be regarded as a uniformly distributed stress of intensity p_0 (which is the intensity at the centre of gravity of the surface C) and a stress of the kind shown in fig. 29. The resultant is p_0S, where S is the whole area of the surface, and it acts at a distance CD from C such that the moment $p_0\text{S.CD} = (p_2 - p_0)\text{I}/x_1 = (p_1+p_0)\text{I}/x_2$. Hence $p_2 = p_0(1+x_2\text{S.CD/I})$, and $p_1 = p_0(1-x_1\text{S.CD/I})$.

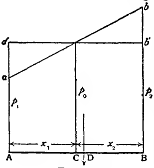

FIG. 30.

Simple bending occurs when a beam is in equilibrium under equal and opposite couples in the plane of the beam. Thus if a beam (fig. 31), supported at its ends, be loaded at two points so that $\text{W}_1l_1 = \text{W}_2l_2$, the portion of the beam lying between W_1 and W_2 is subjected to a simple bending stress. On any section AB the only stress consists of pull and push, and has for its resultant a couple whose moment $\text{M} = \text{W}_1l_1 = \text{W}_2l_2$. This is called the *bending moment* at the section. If the stress be within the elastic limits it will be distributed as in fig. 32, with the neutral axis at the centre of gravity of the section. The greatest intensities of push and of pull, at the top and bottom edge respectively, are $p_1 = \text{M}y_1/\text{I}$ and $p_2 = \text{M}y_2/\text{I}$, and the intensity at any point at a distance y above or below C is $p = \mp \text{M}y/\text{I}$.

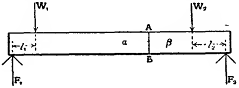

FIG. 31.

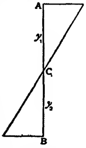

FIG. 32.

Bending beyond Elastic Limits.—Let the bending moment now be increased; non-elastic strain will begin as soon as either p_1 or p_2 exceeds the corresponding limit of elasticity, and the distribution of stress will be changed in consequence of the fact that the outer layers of the beam are taking set while the inner layers are still following Hooke's law. As a simple instance we may consider the case of a material strictly elastic up to a certain stress, and then so plastic that a relatively very large amount of strain is produced without further change of stress, a case not very far from being realized by soft wrought iron and mild steel. The diagram of stress will now take the form sketched in fig. 33. If the elastic limit is (say) less for compression than for tension, the diagram will be as in fig. 34, with the neutral axis shifted towards the tension side. When the beam is relieved from external load it will be left in a state of internal stress, represented, for the case of fig. 33, by the dotted lines in that figure.

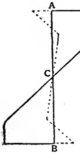

FIG. 33.

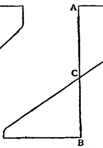

FIG. 34.

In consequence of the action which has been illustrated by these figures, the moment required to break the beam cannot be calculated by taking for f the value of the ultimate tensile or compressive strength of the material in the formula $\text{M} = f\text{I}/y$, because the distribution of stress which is assumed to exist in finding this relation ceases as soon as overstraining begins.

Strain produced by Bending.—The strain produced by bending stress in a bar or beam is, as regards any imaginary filament taken along the length of the piece, sensibly the same as if that filament were directly pulled or compressed by itself. The resulting deformation of the piece consists, in the first place and chiefly, of curvature in the direction of the length, due to the longitudinal extension and compression of the filaments, and, in the second place, of transverse flexure, due to the lateral compression and extension which go along with the longitudinal extension and compression. Let l_1 (fig. 35) be a short portion of the length of a beam strained by a bending moment M (within the limits of elasticity). The beam, which we assume to be originally straight, bends in the direction of its length to a curve of radius R, such that $\text{R}/l = y_1/\delta l$, δl being the change of l by extension or compression at a distance y_1 from the neutral axis. But $\delta l = lp_1/\text{E}$, and $p_1 = \text{M}y_1/\text{I}$. Hence $\text{R} = \text{EI/M}$. The transverse flexure is not, in general, of practical importance. The centre of curvature for it is on the opposite side from the centre for longitudinal flexure, and the radius is Rσ, where σ is the ratio of longitudinal extension to lateral contraction under simple pull.

FIG. 35.

Ordinary Bending of Beams.—Bending combined with shearing is the mode of stress to which beams are ordinarily subject, the loads, or externally applied forces, being applied at right angles to the direction of the length. Let HK (fig. 36) be any cross-section of a beam in equilibrium. The portion B of the beam, which lies on one side of HK, is in equilibrium under the joint action of the external forces F_1, F_2, F_3, &c., and the forces which the other portion A exerts on B in consequence of the state of stress at HK. The forces

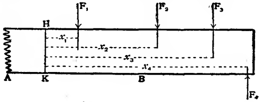

FIG. 36.

F_1, F_2, F_3, &c., may be referred to HK by introducing couples whose moments are F_1x_1, F_2x_2, F_3x_3, &c. Hence the stress at HK must equilibrate, first, a couple whose moment is ΣFx, and, second, a force whose value is ΣF, which tends to shear B from A. In these summations regard must of course be had to the sign of each force; in the diagram the sign of F_4 is opposite to the sign of F_1, F_2 and F_3. Thus the stress at HK may be regarded as that due to a bending moment M equal to the sum of the moments about the section of the externally applied forces on one side of the section (ΣFx), and a shearing force equal to the sum of the forces about one side of the section (ΣF). It is a matter of convenience only whether the forces on B or on A be taken in reckoning the bending moment and the shearing force. The bending moment causes a uniformly varying normal stress on HK of the kind already discussed; the shearing force causes a shearing stress in the plane of the section, the distribution of which will be investigated later. This shearing stress in the plane of the section is necessarily accompanied by an equal intensity of shearing stress in horizontal planes parallel to the length of the beam.

The stress due to the bending moment, consisting of longitudinal push in filaments above the neutral axis and longitudinal pull in filaments below the neutral axis, is the thing chiefly to be considered in practical problems relating to the strength of beams. The general formula $p_1 = My_1/I$ becomes, for a beam of rectangular section of breadth b and depth h, $p_1 = 6M/bh^2 = 6M/Sh$, S being the area of section. For a beam of circular section it becomes $p_1 = 32M/\pi h^3 = 8M/Sh$. The material of a beam is disposed to the greatest advantage as regards resistance to bending when the form is that of a pair of flanges or booms at top and bottom, held apart by a thin but stiff web or by cross-bracing, as in I beams and braced trusses. In such cases sensibly the whole bending moment is taken by the flanges; the intensity of stress over the section of each flange is very nearly uniform, and the areas of section of the tension and compression flanges (S_1 and S_2 respectively) should be proportioned to the value of the ultimate strengths in tension and compression f_t and f_c, so that $S_1f_t = S_2f_c$. Thus for cast-iron beams Hodgkinson recommended that the tension flange should have six times the sectional area of the compression flange. The intensity of longitudinal stress on the two flanges of an I beam is approximately M/S_1h and M/S_2h, h being the depth from centre to centre of the flanges.

Diagrams of Bending Moment and Shearing Force.—In the examination of loaded beams it is convenient to represent graphically the bending moment and the shearing force at various sections by setting up ordinates to represent the values of these quantities, and so drawing curves of bending moment and shearing force.

The area enclosed by the curve of shearing force, up to any ordinate, is equal to the bending moment at the same section. For let x be increased to $x+\delta x$, the bending moment changes to $\Sigma F(x+\delta x)$, or $\delta M = \delta x \Sigma F$. Hence the shearing force at any section is equal to the rate of change of the bending moment there per unit of the length, and the bending moment is the integral of the shearing force with respect to the length. In the case of a continuous distribution of load, it should be observed that, when x is increased to $x+\delta x$, the moment changes by an additional amount which depends on $(\delta x)^2$ and may therefore be neglected.

Distribution of Shearing Stress.—To examine the distribution of shearing stress over any vertical section of a beam, we may consider two closely adjacent sections AB and DE (fig. 37), on which the bending moments are M and $M+\delta M$ respectively. The resultant horizontal force due to the bending stresses on a piece ADHG enclosed between the adjacent sections, and bounded by the horizontal plane GH at a distance y_0 from the neutral axis, is shown by the shaded figure. This must be equilibrated by the horizontal shearing stress on GH, which is the only other horizontal force acting on the piece. At any height y the intensity of resultant horizontal stress due to the difference of the bending moments is $y\delta M/I$, and the whole horizontal force on GH is $\frac{\delta M}{I}\int_{y_0}^{y_1} yzdy$, z being the breadth. If q be the intensity of horizontal shearing stress on the section GH, whose breadth is z_0, we have

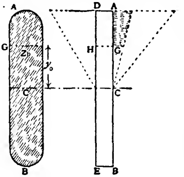

FIG. 37.

$$qz_0\delta x = \frac{\delta M}{I}\int_{y_0}^{y_1} yzdy.$$

But $\delta M/\delta x$ is the whole shearing force Q on the section of the beam. Hence

$$q = \frac{Q}{z_0 I}\int_{y_0}^{y_1} yzdy;$$

and this is also the intensity of vertical shearing stress at the distance y_0 from the neutral axis. This expression may conveniently be written $q = QAy/z_0I$, where A is the area of the surface AG and y the distance of its centre of gravity from the neutral axis. The intensity q is a maximum at the neutral axis and diminishes to zero at the top and bottom of the beam. In a beam of rectangular section the value of the shearing stress at the neutral axis is q max. $= \frac{3}{2}Q/bh$. In other words, the maximum intensity of shearing stress on any section is $\frac{3}{2}$ of the mean intensity. Similarly, in a beam of circular section the maximum is $\frac{4}{3}$ of the mean. This result is of some importance in application to the pins of pin-joints, which may be treated as very short beams liable to give way by shearing.

In the case of an I beam with wide flanges and a thin web, the above expression shows that in any vertical section q is nearly constant in the web and insignificantly small in the flanges. Practically all the shearing stress is borne by the web, and its intensity is very nearly equal to Q divided by the area of section of the web.

Principal Stresses in a Beam.—The foregoing analysis of the stresses in a beam, which resolves them into longitudinal pull and push, due to bending moment, along with shear in longitudinal and transverse planes, is generally sufficient in the treatment of practical cases. If, however, it is desired to find the direction and magnitude of the principal stresses at any point we may proceed thus:—

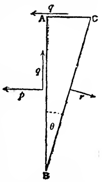

FIG. 38.

Let AC (fig. 38) be an indefinitely small portion of the horizontal section of a beam, on which there is only shearing stress, and let AB be an indefinitely small portion of the vertical section at the same place, on which there is shearing and normal stress. Let q be the intensity of the shearing stress, which is the same on AB and AC, and let p be the intensity of normal stress on AB: it is required to find a third plane BC, such that the stress on it is wholly normal, and to find r, the intensity of that stress. Let θ be the angle (to be determined) which BC makes with AB. Then the equilibrium of the triangular wedge ABC requires that

$$r\text{BC}\cos\theta = p.\text{AB} + q.\text{AC}, \text{ and } r\text{BC}\sin\theta = q.\text{AB};$$

or $\quad (r-p)\cos\theta = q\sin\theta$, and $r\sin\theta = q\cos\theta$.

Hence,

$$q^2 = r(r-p),$$
$$\tan 2\theta = 2q/p,$$
$$r = \tfrac{1}{2}p \pm \sqrt{(q^2 + \tfrac{1}{4}p^2)}.$$

The positive value of r is the greater principal stress, and is of the same sign as p. The negative value is the lesser principal stress which occurs on a plane at right angles to the former. The equation for θ gives two values corresponding to the two planes of principal stress. The greatest intensity of shearing stress occurs on the pair of planes inclined at 45° to the planes of principal stress, and its value is $\sqrt{(q^2 + \frac{1}{4}p^2)}$.

Deflexion of Beams.—The deflexion of beams is due partly to the distortion caused by shearing, but chiefly to the simple bending which occurs at each vertical section. As regards the second, which in most cases is the only important cause of deflexion, we have seen that the radius of curvature R at any section, due to a bending moment M, is EI/M, which may also be written Ey_1/p_1. Thus beams of uniform strength and depth (and, as a particular case, beams of uniform section subjected to a uniform bending moment) bend into a circular arc. In other cases the form of the bent beam, and the resulting slope and deflexion, may be determined by integrating the curvature throughout the span, or by a graphic process, which consists in drawing a curve to represent the beam with its curvature greatly exaggerated, after the radius of curvature has been determined for a sufficient number of sections. In all practical cases the curvature is so small that the arc and chord are of sensibly the same length. Calling i the angle of slope, and u the dip or deflexion from the chord, the equation to the curve into which an originally straight beam bends may be written

$$\frac{du}{dx} = i; \quad \frac{d^2u}{dx^2} = \frac{di}{dx} = \frac{EI}{M}.$$

Integrating this for a beam of uniform section, of span L, supported at its ends and loaded with a weight W at the centre, we have, for the greatest slope and greatest deflexion, respectively, $i_1 = WL^2/16EI$, $u_1 = WL^3/48EI$. If the load W is uniformly distributed over L, $i_1 = WL^2/24EI$ and $u_1 = 5WL^3/384EI$.

The additional slope which shearing stress produces in any originally horizontal layer is q/C, where q is, as before, the intensity of shearing stress and C is the modulus of rigidity. In a round or rectangular bar the additional deflexion due to shearing is scarcely appreciable. In an I beam, with a web only thick enough to resist shear, it may be a somewhat considerable proportion of the whole.

Torsion of Solid and Hollow Shafts.—Torsion occurs in a bar to which equal and opposite couples are applied, the axis of the bar being the axis of the couples, and gives rise to shearing stress in planes perpendicular to the axis. Let AB (fig. 39) be a uniform circular shaft held fast at the end A, and twisted by a couple applied in the plane BB. Assuming the strain to be within the limits of elasticity, a radius CD turns round to CD′, and a line AD drawn at any distance r from the axis, and originally straight, changes into the helix AD′. Let θ be the angle which this helix makes with lines parallel to the axis, or in other words the angle of shear at the distance

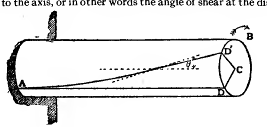

FIG. 39.

r from the axis, and let i be the angle of twist DCD′. Taking two sections at a distance dx from one another, we have the arc $\theta dx = r di$. Hence q, the intensity of shearing stress in a plane of cross-section, varies as r, since $q = C\theta = Cr\ di/dx$. The resultant moment of the whole shearing stress on each plane of cross-section is equal to the twisting moment M. Thus

$$\int 2\pi r^2 q dr = \text{M}.$$

Calling r_1 the outside radius (where the shearing stress is greatest) and q_1 its intensity there, we have $q = rq_1/r_1$, and hence, for a solid shaft, $q_1 = 2\text{M}/\pi r_1^3$. For a hollow shaft with a central hole of radius r_2 the same reasoning applies: the limits of integration are now r_1 and r_2, and

$$q_1 = \frac{2\text{M}r_1}{\pi(r_1^4 - r_2^4)}.$$

The lines of principal stress are obviously helices inclined at 45° to the axis.

If the shaft has any other form of section than a solid or symmetrical hollow circle, an originally straight radial line becomes warped when the shaft is twisted, and the shearing stress is no longer proportional to the distance from the axis. The twisting of shafts of square, triangular and other sections has been investigated by Saint-Venant. In a square shaft (side $= h$) the stress is greatest at the middle of each side, and its intensity there is $q_1 = \text{M}/0{\cdot}281h^3$.

For round sections the angle of twist per unit of length is $i = \dfrac{q_1}{Cr_1} = \dfrac{2\text{M}}{\pi Cr_1^4}$ in solid and $\dfrac{2\text{M}}{\pi C(r_1^4 - r_2^4)}$ in hollow shafts.

In what has been said above it is assumed that the stress is within the limit of elasticity. When the twisting couple is increased so that this limit is passed, plastic yielding begins in the outermost layer, and a larger proportion of the whole stress falls to be borne by layers nearer the centre. The case is similar to that of a beam bent beyond the elastic limit, described above. If we suppose the process of twisting to be continued, and that after passing the limit of elasticity the material is capable of much distortion without further increase of shearing stress, the distribution of stress on any cross section will finally have an approximately uniform value q', and the moment of torsion will be

$$\int_{r_2}^{r_1} 2\pi r^2 q' dr = \tfrac{2}{3}\pi q'(r_1^3 - r_2^3).$$

In the case of a solid shaft this gives for M a value greater than it has when the stress in the outermost layer only reaches the intensity q', in the ratio of 4 to 3. It is obvious from this consideration that the ultimate strength of a shaft to resist torsion is no more deducible from a knowledge of the ultimate shearing strength of the material than the ultimate strength of a beam to resist bending is deducible from a knowledge of the tensile and crushing strength. It should be noticed also that as regards ultimate strength a solid shaft has an important advantage over a hollow shaft of the same elastic strength, or a hollow shaft so proportioned that the greatest working intensity of stress is the same as in the solid shaft.

Twisting Combined with Bending.—This important practical case is realized in a crank-shaft (fig. 40). Let a force P be applied at the crank-pin A at right angles to the plane of the crank. At any section of the shaft C (between the crank and the bearing) there is a twisting moment $\text{M}_1 = \text{P.AB}$ and a bending moment $\text{M}_2 = \text{P.BC}$. There is also a direct shearing force P, but this does not require to be taken into account in calculating the stress at points at the top or bottom of the circumference (where the intensity is greatest), since the direct shearing stress is distributed so that its intensity is zero at these points. The stress there is consequently made up of longitudinal normal stress (due to bending), $p_1 = 4\text{M}_2/\pi r_1^3$, and shearing stress (due to torsion), $q_1 = 2\text{M}_1/\pi r_1^3$. Combining these, as in § 64, we find for the principal stresses $r = 2\{\text{M}_2 \pm \sqrt{(\text{M}_1^2 + \text{M}_2^2)}\}/\pi r_1^3$, or $r = 2\text{P}(\text{BC} \pm \text{AC})/\pi r_1^3$. The greatest shearing stress is $2\text{P. AC}/\pi r_1^3$, and the axes of principal stress are inclined so that $\tan 2\theta = \text{M}_1/\text{M}_2 = \text{AB/BC}$. The axis of greater principal stress bisects the angle ACB.

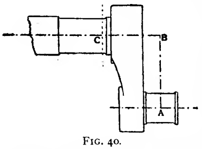

FIG. 40.

Long Columns and Struts: Compression and Bending.—A long strut or pillar, compressed by forces P applied at the ends in the direction of the axis, becomes unstable as regards flexure when P exceeds a certain value. Under no circumstances can this value of P be exceeded in loading a strut. But it may happen that the intensity of stress produced by smaller loads exceeds the safe compressive strength of the material, in which case a lower limit of load must be chosen. If the applied load is not strictly axial, if the strut is not initially straight, if it is subject to any deflexion by transverse forces, or if the modulus of elasticity is not uniform over each cross-section—then loads smaller than the limit which causes instability will produce a certain deflexion which increases with increase of load, and will give rise to a uniformly varying stress of the kind illustrated in figs. 28 and 30. We shall first consider the ideal case in which the forces at the ends are strictly axial, the strut perfectly straight and free from transverse loads and perfectly symmetrical as to elasticity. Two conditions have to be distinguished—that in which the ends are held by pins or sockets which leave them free to rock, and that in which the ends are held fixed. Suppose in the first place that the ends are free to rock. The value of the load which causes instability will be found by considering what force P applied to each end would suffice to hold an originally straight strut in a bent state, supposing it to have received a small amount of elastic curvature in any way. It is shown by Euler that the force required to maintain the strut in its curved state is $\text{P} = \pi^2\text{EI/L}^2$, and is independent of the deflexion. This means that with this particular value of P (which for brevity we shall write P_1) the strut will be in neutral equilibrium when bent; with a value of P less than P_1 it will be stable; with a greater value it will be unstable. Hence a load exceeding P_1 will certainly cause rupture. The value $\pi^2\text{EI/L}^2$ applies to struts with ends free to rock. If the ends are fixed the effective length for bending is reduced by one half, so that P_1 then is $4\pi^2\text{EI/L}^2$. When one end is fixed and the other is free to rock P_1 has an intermediate value, probably about $9\pi^2\text{EI}/4\text{L}^2$.

The above theory assigns P_1 as a limit to the strength of a strut on account of flexural instability; but a stress less than P_1 may cause direct crushing. Let S be the area of section, and f_c the strength of the material to resist crushing. Thus a strut which conforms to the ideal conditions specified above will fail by simple crushing if $f_c\text{S}$ is less than P_1, but by bending if $f_c\text{S}$ is greater than P_1. Hence with a given material and form of section the ideal strut will fail by direct crushing if the length is less than a certain multiple of the least breadth (easily calculated from the expression for P_1), and in that case its strength will be independent of the length; when the length is greater than this the strut will yield by bending, and its strength diminishes rapidly as the length is increased.

But the conditions which the above theory assumes are never realized in practice. The load is never strictly axial, nor the strut absolutely straight to begin with, nor the elasticity uniform. The result is that the strength is in all cases less than either $f_c\text{S}$ or P_1, and the results of experiments are best expressed by means of a formula, which is in part empirical, giving continuous values for struts of any length. For very short struts we have seen that the ideal breaking load is $f_c\text{S}$, and for very long struts it is $\pi^2\text{EI/L}^2$. If we write $\text{P} = f_c\text{S}/(1 + f_c\text{SL}^2/\pi^2\text{EI})$, we have a formula which gives correct values in these two extreme cases, and intermediate values for struts of medium length. By writing this $\text{P} = f\text{S}/(1 + c\text{SL}^2/\text{I})$, and treating f and c as empirical constants, we have a practical formula which fits in well with experimental results and is applicable to struts of any length when the ends are free to rock. For fixed ends $\tfrac{1}{4}c$ is to be taken in place of c.

Bursting Strength of Circular Cylinders and Spheres.—Space remains for the consideration of only one other mode of stress, of great importance from its occurrence in boilers, pipes, hydraulic and steam cylinders and guns. The material of a hollow cylinder, subjected to pressure from within, is thrown into a stress of circumferential pull. When the thickness t is small compared with the radius R, we may treat this stress as uniformly distributed over the thickness. Let p be the intensity of fluid pressure within a hollow circular cylinder, and let f be the intensity of circumferential stress. Consider the forces on a small rectangular plate (fig. 41), with its sides parallel and perpendicular to the direction of the axis, of length l and width $\text{R}\delta\theta$, $\delta\theta$ being the small angle it subtends at the axis. Whatever forces act on this plate in the direction of the axis are equal and opposite. The remaining forces, which are in equilibrium,

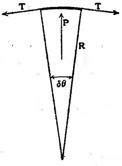

FIG. 41.

are P, the total pressure from within, and a force T at each side due to the circumferential stress. $P=plR\delta\theta$ and $T=flt$. But by the triangle of forces (fig. 42) $P=T\delta\theta$. Hence $f=pR/t$.

The ends of the cylinder may or may not be held together by longitudinal stress in the cylinder sides; if they are, then, whatever be the form of the area of the ends, a transverse section, the area of whch is $2\pi Rt$, has to bear a total force $p\pi R^2$. Hence, if f' be the intensity of longitudinal stress, $f'=pR/2t=\frac{1}{2}f$.

FIG. 42.

A thin hollow sphere under internal pressure has equal circumferential pull in all directions. To find its value consider the plate of fig. 42. There are now four equal forces T, on each of the four sides, to equilibrate the radial force P. Hence $P=2T\delta\theta$ and $f=pR/2t$.

Thick Cylinder.—When the thickness is not small compared with the radius, the radial pressure is transmitted from layer to layer with reduced intensity, and the circumferential pull diminishes towards the outside. In the case of a thick cylinder with free ends[1] we have to deal at any point with two principal stresses, radial and circumferential, which may be denoted by p and p' respectively. Supposing (as we may properly do in dealing with a cylinder which is not very short) that a transverse section originally plane remains plane, the longitudinal strain is uniform. Since there is no longitudinal stress this strain is due entirely to the lateral action of the stresses p and p', and its amount is $(p+p')/\sigma E$. Hence at all points $p+p'=\text{constant}$.[2] Further, by considering the equilibrium of any thin laycr, as we have already considered that of a thin cylinder, we have $\frac{d}{dr}(pr)=p'$.

These two equations give by integration, $p=C+C'/r^2$, and $p'=C-C'/r^2$.

If r_1 be the external and r_2 the internal radius, and p_0 the pressure on the inner surface, the conditions that $p=p_0$ when $r=r_2$ and $p=0$ when $r=r_1$ give $C=-p_0r_2^2/(r_1^2-r_2^2)$ and $C'=-Cr_1^2$. Hence the circumferential stress at any radius r is $p'=-p_0r_2^2(1+r_1^2/r^2)/(r_1^2-r_2^2)$. At the insidc, where this is greatest, its value is $-p_0(r_1^2+r_2^2)/(r_1^2-r_2^2)$—a quantity always greater than p_0, however thick the cylinder is.

In the construction of guns various devices have been used to equalize the circumferential tension. With cast guns a chilled core has been employed to make the inncr layers solidify and cool first, so that they are afterwards compressed by the later contraction of the outer layers. In guns built up of wrought-iron or steel hoops the hoops are bored small by a regulated amount and are shrunk on over the barrel or over the inner hoops. In J. A. Longridge's system, largely used for heavy ordnance, the gun is made by winding steel wire or ribbon, with suitable initial tension, on a central steel tube.

The circumferential stress at any point of a thick hollow sphere exposed to internal fluid pressure is found, by a process like that of the last paragraph, to be $-p_0r_2^3(1+r_1^3/2r^3)/(r_1^3-r_2^3)$, which gives, for the greatest tension, the value

$$-p_0(r_1^3+2r_2^3)/2(r_1^3-r_2^3).$$

(J. A. E.)

STRESA, a village of Piedmont, Italy, in the province of Novara, situated on the west side of Lago Maggiore, on the Simplon railway, 10 m. N. of Arona, 673 ft. above sea-level. Pop. (1901), 1477. It is remarkable for the beauty of its scenery and for its fine villas, and is a favourite resort in spring, summer and autumn.

STRICKLAND, AGNES (1806–1874), English historical writer, was born in 1806, the third daughter of Thomas Strickland, of Reydon Hall, Suffolk. Her first literary efforts were historical romances in verse in the style of Walter Scott—*Worcester Field* (published without date), *Demetrius and other Poems* (1833). From this she passed to prose histories, written in a simple style for thc young. A picturesque sketch of the *Pilgrims of Walsingham* appeared in 1835, two volumes of *Tales and Stories from History* in the following year. Then, with the assistance of her sister, she projected a more ambitious work, *The Lives of the Queens of England*, from Matilda of Flanders to Queen Anne. Thc first volume appcared in 1840, the twelfth and last in 1849. Miss Strickland was a warm partisan on the side of royalty and the church, but she made industrious study of "official records and other public documents," gave copious extracts from them, and drew interesting pictures of manners and customs. While engaged on this work she found time in 1843 to edit the *Letters of Mary, Queen of Scots*, whose innocence she championed with enthusiasm. In 1850 she followed up her *Queens of England* with the *Lives of the Queens of Scotland*, completing the series in eight volumes in 1859. Unresting in her industry, she turned next to the *Bachelor Kings of England*, about whom she published a volume in 1861. The *Lives of the Seven Bishops* followed in 1866—after a longer interval, part of which was employed in producing an abridged version of her *Queens of England*. Her last work was the *Lives of the Last Four Stuart Princesses*, published in 1872. In 1871 she obtained a civil-list pension of £100 in recognition of her merits. She died on the 8th of July 1874.

A *Life* by her sister, Jane Margaret Strickland, appeared in 1887.

STRICKLAND, HUGH EDWIN (1811–1853), English naturalist and geologist, was born at Righton, in the East Riding of Yorkshire, on the 2nd of March 1811, and was grandson of Sir George Strickland, Bart. As a lad he acquired a taste for natural history which dominated his life. He received his early education from private tutors and in 1829 entered Oriel College, Oxford. He attended the anatomical lectures of Dr John Kidd and the geological lectures of Dr W. Buckland and he became greatly interested both in zoology and geology. He graduated B.A. in 1831, and proceeded to M.A. in the following year. Returning to his home at Cracombe House, near Tewkesbury, he began to study the geology of the Vale of Evesham, communicating papers to the Geological Society of London (1833–1834). He also gave much attention to ornithology. Becoming acquainted with Murchison he was introduced to William John Hamilton (1805–1867) and accompanied him in 1835 in a journey through Asia Minor, the Thracian Bosporus and the Island of Zante. Mr Hamilton afterwards published the results of this journey and of a subsequent excursion by himself to Armenia in *Researches in Asia Minor, Pontus and Armenia* (1842). After his return in 1836 Strickland brought before the Geological Society several papers on the geology of the districts he had visited in southern Europe and Asia. He also described in detail the drift deposits in the counties of Worcester and Warwick, drawing particular attention to the fluviatile deposits of Cropthorne in which remains of hippopotamus, &c., were found. With Murchison he read before the Geological Society an important paper "On the Upper Formations of the New Red Sandstone System in Gloucestershire, Worcestershire and Warwickshire" (*Trans. Geol. Soc.*, 1840). In other papers he described the Bristol Bone-bed near Tewkesbury and the Ludlow Bone-bed of Woolhope. He was author likewise of ornithological memoirs communicated to the Zoological Society, the *Annals* and *Magazine of Natural History* and the British Association. He also drew up the report, in 1842, of a committee appointed by the British Association to consider the rules of zoological nomenclature. He was one of the founders of the Ray Society suggested in 1843 and established in 1844, the object being the publication of works on natural history which could not be undertaken by scientific societies or by publishers. For this society Strickland corrected, enlarged and edited the MS. of Agassiz for the *Bibliographia Zoologiae et Geologiae* (1848). In 1845 he edited with J. Buckman a second and enlarged edition of Murchison's *Outline of the Geology of the neighbourhood of Cheltenham.* In 1846 he settled at Oxford, and two years later he issued in conjunction with Dr A. G. Melville a work on *The Dodo and its kindred.* In 1850 he was appointed deputy reader in geology at Oxford during the illness of Buckland, and in 1852 he was elected F.R.S. In the following year, after attending the meeting of the British Association at Hull, he went to examine the cuttings on the Manchester, Sheffield & Lincolnshire railway near Retford, and he was there knocked down and killed by a train on the 14th of September 1853. He was buried at Deerhurst church near Tewkesbury, where a memorial window was erected.

See *Memoirs of H. E. Strickland*, by Sir William Jardine, Bart. (1858).

[1] This condition is realized in practice when the fluid causing internal pressure is held in by a piston, and the stress between this piston and the other end of the cylinder is taken by some other part of the structure than the cylinder sides.

[2] The solution which follows in the text is applicable even when there is longitudinal stress, provided that the longitudinal stress is uniformly distributed over each transverse section. If we call this stress p'', the longitudinal strain is $p''/E+(p+p')/\sigma E$. Since the whole strain is uniform, and p'' is uniform, the sum of p and p' is constant at all points, as in the case where the ends are free.

STRIEGAU, a town of Germany, in the Prussian province of Silesia, on the Striegau Water (*Striegauer Wasser*), 30 m. by rail S.W. of Breslau. Pop. (1905), 13,427. It contains four Roman Catholic churches, among which is that of St Peter and St Paul, with a vaulted roof 100 ft. in height, the highest in Silesia; a Protestant church and numerous educational and charitable institutions. The chief industries of the place are the making of cigars, malt and machinery; also of albums, portfolios and other articles in leather. Granite is quarried in the neighbourhood and there is an extensive trade in grain. It was near Striegau that Frederick the Great gained the important victory usually named after the village of Hohenfriedberg, on the 4th of June 1745. The town rights of Striegau date from 1242.

STRIKES AND LOCK-OUTS. A strike, in the labour sense, is a stoppage of work by common agreement on the part of a body of work-people for the purpose of obtaining or resisting a change in the conditions of employment. The body of work-people may be large or small, and the cessation of work may be simultaneous or gradual; *e.g.* if the notices to cease work happen to expire at different dates, the cessation may nevertheless be a strike, provided it takes place as the result of a common agreement. It will be seen from the above definition that a strike, though the immediate result of an agreement, formal or tacit, on the part of work-people to withhold their labour, may originate in a demand on the part of the employer as well as on the part of the employés. In the former case the stoppage is often (though loosely) termed a "lock-out." It is obvious, however, that to distinguish stoppages as strikes or lock-outs according to the source of the original demand for a change of conditions would lead to a very arbitrary and misleading classification. Frequently it is not easy to say which side made the original demand to which the dispute is to be attributed, and frequently a stoppage is the result of a break-down of negotiations in the course of which demands have been made by both sides. Moreover, in so far as the distinction can be drawn, it would lead to the result that in almost all cases a dispute in times of improving trade would be termed a strike, and in times of declining trade a lock-out. It is not possible to frame an entirely satisfactory definition of a lock-out which shall enable it always to be discriminated from a strike. It may be noticed that the attempt to make this distinction has been abandoned in the board of trade statistics since 1894, both kinds of stoppages being now included under the comprehensive title of "trade disputes."

The only basis of distinction between a "strike" and a "lock-out," which is sufficiently definite for precise or statistical purposes, is the source from which the actual notice to cease work emanates, cessations resulting from notices given by the employers being termed "lock-outs," while those which either result from notices given by the men, or from their withdrawal from work without notice, would be termed "strikes." But whether the term "lock-out" be restricted as above, or applied, as in the popular use of the term, to any dispute in which the employers appear to be the aggressors, the distinction does not afford a sound basis for the statistical classification of disputes. The source of the actual notices to leave work is often quite an unimportant matter; while, on the other hand, if the ordinary current use of the terms be followed, there will be many disputes which, according to the workmen's view, should be termed lock-outs, and, according to the employers, should be termed strikes—a difficulty which was well illustrated in the controversy as to whether the "strike clauses" in admiralty contracts could be invoked in the case of work stopped through the engineering dispute of 1897. In the present article, therefore, no distinction is drawn for statistical purposes between a strike and a lock-out.

Another distinction, perhaps of greater importance than the above, but which in practice it is sometimes difficult to draw, is between a stoppage in pursuance of a trade dispute and a stoppage due to a bona-fide dismissal or change of employment arising from the intention of an employer to cease to employ a particular set of men, or of a group of workmen to cease to work for a particular employer. Generally speaking, a stoppage may rightly be termed a trade dispute if there be an intention on the part of both parties (at least at the beginning) to resume the relations of employer and employed on the satisfaction of certain specified conditions. Where the willingness to resume this relation exists on one side only the question is more difficult, and accordingly it is not uncommon for an employer to deny the existence of a trade dispute, although the men formerly in his employ may be actually drawing "strike pay" from their unions and "picketing" his works to prevent their places being filled. Such cases sometimes arise when the workmen consider that the dismissal of some of their colleagues is due not to personal faults or slackness of employment, but to some collective action which they have taken, or to their membership of some organization. Broadly speaking, however, the distinction is that a trade dispute is a temporary stoppage entered into to obtain or to resist a change of conditions of employment.

The essence of a strike or lock-out is a refusal on the part of a number of workmen collectively or of an employer to renew contracts of employment except on certain changed conditions. This simple situation may be complicated by actual breaches of contract, as when a body of work-people leave work without notice, or by attempts on their part to prevent other persons from entering into contracts of service, or to persuade other persons to terminate or break their contracts. But such features as these, though common to many strikes, are not essential. The question of the legal position of strikes, and of the methods adopted for the conduct of strikes, is discussed below. Here it is only necessary to point out that strikes, as such, are incidents arising out of the modern relationship of free contract as between employers and workmen, and have little real analogy with the revolts of servile or semi-servile labour in ancient or medieval times.

Trade Disputes in the United Kingdom.

Since 1888 the board of trade have kept a record of strikes and lock-outs in the United Kingdom. The following table, based on the official returns published by that department, shows the number and importance of these stoppages in the United Kingdom from 1893 to 1907:—

Year.	Number of Disputes.	Number of Work-people affected.			Aggregate Duration in Working Days.
		Directly.	Indirectly.	Total.	
1893	615	594,149	40,152	634,301	30,467,765
1894	929	257,314	67,934	325,248	9,529,010
1895	745	207,239	55,884	263,123	5,724,670
1896	926	147,950	50,240	198,190	3,746,368
1897	864	167,453	62,814	230,267	10,345,523
1898	711	200,769	53,138	253,907	15,289,478
1899	719	138,058	42,159	180,217	2,516,416
1900	648	135,145	53,393	188,538	3,152,694
1901	642	111,437	68,109	179,546	4,142,287
1902	442	116,824	139,843	256,667	3,479,255
1903	387	93,515	23,386	116,901	2,338,668
1904	355	56,380	30,828	87,208	1,484,220
1905	358	67,653	25,850	93,503	2,470,189
1906	486	157,872	59,901	217,773	3,028,816
1907	601	100,728	46,770	147,498	2,162,151

It should be noted that by "indirectly affected" are meant the work-people employed in the same establishments as those on strike, who are thrown out of employment owing to the strike, but are not themselves engaged in it. The board of trade statistics do not take into account the persons employed in kindred trades who are indirectly affected.

An important thing to note about the above statistics is that in many years they are dominated by a few large disputes. Some of the larger cases are shown on the following page.

In 1907 487 of the recorded disputes (or about four-fifths of the whole number) accounted for less than one-third of the total time lost, and this, it is to be remembered, is after the very small disputes have been excluded.

By "aggregate duration" or "time lost" is meant the product of the number affected multiplied by the duration of the dispute in working days, with some allowance for those who have found work elsewhere or been replaced by others. Though this figure is the best general index of the importance of the disputes of each year, it is but a rough approximation to the time actually lost through disputes.

Year.	Principal Disputes of the Year.			All other Disputes.		
	Trade and Locality.	Number of Work-people affected.	Aggregate Duration in Working Days.	Number of Disputes.	Number of Work-people affected.	Aggregate Duration in Working Days.
1893	Coal Miners (Federated Districts)	300,000	21,137,000	613	244,301	7,830,765
	Coal Miners (South Wales and Monmouth)	90,000	1,500,000			
1894	Coal Miners (Scotland)	70,000	5,600,000	928	255,248	3,929,010
1895	Boot and Shoe Operatives	46,000	1,564,000	744	217,123	4,160,670
1897	Engineers, Machinemen and others.	47,500	5,731,000	863	182,767	4,614,523
1898	Engineers, Machinemen and others—*continued*		1,118,000	710	153,907	2,521,478
	Coal Miners (South Wales and Monmouth)	100,000	11,650,000			

For example, if a strike causes a postponement or accumulation of work, the extra demand for labour, and the overtime worked after its conclusion, may partially compensate for the stoppage. On the other hand, if a dispute should drive away trade or cause the closing of works, it may lessen the field of employment for a long period after its termination, and such lost time cannot be taken into account in the estimates of "aggregate duration."

For these reasons all estimates of wages lost through disputes are somewhat fallacious. The real importance of strikes lies less in the value of the actual time consumed by their duration, than in their indirect effects on the organization and effectiveness of the industry, and on the relations of employer to employed, and also in their reaction on the conditions of allied trades. The comparative insignificance of the actual loss

Group of Trades.	Mean Annual			Percentage of Total Number employed who were affected by Disputes.	Percentage of Aggregate Working Time occupied by Disputes.
	Number of Disputes.	Number of Work-people affected (directly and indirectly).	Aggregate Duration in Working Days.		
Building	43	5,260	234,651	0·5	0·07
Mining and Quarrying	133	87,509	1,348,289	8·7	0·45
Metal, Engineering and Shipbuilding	95	22,470	534,549	1·6	0·13
Textile	90	27,736	326,468	2·3	0·09
Clothing	36	4,992	104,619	0·7	0·05
Other	72	9,047	180,793	0·2	0·01
All Industries, except Agricultural Labourers, Seamen and Domestic Servants	469	157,014	2,729,369	1·6	0·09

to production owing to the mere loss of time caused by strikes will be seen from the fact that the total duration of strikes during the seven years 1901–1907, if spread over the entire adult male working population, would be equivalent to less than the loss of one-third of a day per head per annum. As a matter of fact, however, the loss owing to strikes is very unequally distributed over the industrial population. In large groups of industries, *e.g.* agriculture, strikes are of rare occurrence. In others, such as the building trades, they are frequent, but mostly small and local; while in mining they are not only frequent and often prolonged, but in many cases they involve large numbers of persons and extend over wide areas. Thus on an average of the seven years 1901–1907 there were 43 disputes annually in the building trades, and 133 in mining and quarrying, but the latter disputes have involved nearly seventeen times as many persons and had an aggregate duration nearly six times as great. Intermediate between these groups of trades is the metal, engineering and shipbuilding group, in which, more perhaps than in any other group, the importance of disputes varies according to the state of trade.

The principal facts relating to the distribution of trade disputes among the more important groups of trades are given in the above table for the mean of the seven years 1901–1907.

It would be natural to expect that trade disputes would be most prevalent at or just after a turn in the tide of employment, when there is most room for bona-fide disagreement as to the conditions of the labour market. These are undoubtedly the most critical times in the relations of employers and employed, but the disturbing influence of accidental causes is too great to enable any regular law of variations in disputes to be established by statistical evidence. It is to be remembered that in recent years there has been a great development in the means available for avoiding stoppages by conciliatory action (see Arbitration and Conciliation), and this of itself would greatly complicate the task of tracing any correspondence between the prevalence of actual stoppages and the state of employment. Broadly it may be said that the great majority of upward and downward changes of wages are settled nowadays without strikes, and in many trades actual stoppages, instead of being a normal feature in the relations between employer and employed, are rather to be looked on as cases of accidental breakdown of the recognized machinery of negotiation.

Causes.

The causes of disputes are of course very varied, embracing all the matters relating to conditions of employment on which differences may arise between employers and employed. Experience shows, however, that the great bulk of disputes relate to questions of wages, a much smaller proportion to hours of labour, and the balance to a large number of miscellaneous questions, such as the employment of persons or classes obnoxious to the strikers on the ground that they do not belong to their union, or have worked against its interests, or because they are held to have no "right" to the particular occupation on which they are employed, either on account of not having gone through the recognized training or of belonging to another trade. Among this class of strikes are to be included the so-called "demarcation" disputes between two bodies of workmen as to the limits of their trades, which frequently cause suspension of work by both groups, to the great inconvenience of the employer. Strikes are also not uncommon on the question of trade unionism pure and simple—*i.e.* to obtain or defend freedom to belong to a union, or to act through its agency in negotiations with employers. This question enters more or less as a factor into a large number of disputes, most usually, however, as a secondary cause or object, so that it does not appear prominently in the tabulation of causes in the board of trade statistics, which is based on principal causes only. Thus the formulated demands of the strikers are usually for improved conditions of work, the question of "recognition" of the trade union only arising incidentally when the parties attempt to negotiate as to these demands. The following table, showing the principal causes of disputes for the seven years 1901–1907, is based on the official statistics:—

Percentage Proportion of Work-people directly affected by Disputes in the seven years, 1901–1907, relating to				
Questions of Wages.	Questions of Hours.	Employment of particular Classes or Persons.	Trade Unionism.	Other Causes.
54·5	3·6	9·2	18·2	14·5

Methods of Settlement and Results. The results of trade disputes are nearly as varied as their causes. Sometimes a strike goes on until the employer is ruined or retires from business, and is only ended by the permanent closing of the works; sometimes, especially when trade is slack and the dispute not large, the places of the men are almost immediately filled, and the only economic result of the strike is to replace one body of men by another without perceptible interruption of business. There have been frequent cases of this kind in strikes of unskilled labourers. Sometimes, on the other hand, the demand for labour is so active that the whole of the strikers immediately find work elsewhere, and the only economic result is to transfer a body of men from one set of employers to another with little or no interruption of their employment. In years of active employment the building trades have afforded many examples of this issue of a trade dispute. In other cases, after a more or less prolonged stoppage, the disputes end by the permanent "blocking" of an employer's establishment by a union, or the permanent refusal of the employer to take back any of his former employés. All these, however, are extreme, and on the whole exceptional cases. The vast majority of trade disputes are settled by mutual arrangement, and whether such arrangement is wholly in favour of one or other party, or involves a compromise, its terms provide that the whole or part of the body of work-people whose labour was withheld or excluded shall return on agreed conditions to their former employment.

During the period 1901 to 1907 there were on an average 465 disputes settled annually, affecting directly and indirectly 156,800 work-people, and of these only 44 disputes, involving 15,700 work-people, were ended by the return to work of the strikers on their employers' terms without negotiation of any kind, and 69 disputes involving 5500 persons by replacement of the work-people or by the closing of works. All the remaining disputes, 352 in number, involving 135,600 persons, were concluded by negotiation between the parties either with, or more usually without, the aid of an outside mediator or arbitrator.

The following figures for 1901–1907 (which practically coincide with those of the previous decennial average) show the comparative results of trade disputes. The percentages refer to the proportion of work-people directly involved in disputes which resulted in the manner indicated:—

Year.	In favor of Work-people.	In favor of Employers.	Compromised.[1]	Indefinite.	Total.
1901	27·5	34·7	37·3	0·5	100·0
1902	31·8	31·8	36·1	0·3	100·0
1903	31·2	48·1	20·7	0·0	100·0
1904	27·3	41·7	30·9	0·1	100·0
1905	24·7	34·0	41·2	0·1	100·0
1906	42·5	24·5	33·0	0·0	100·0
1907	32·6	27·0	40·1	0·3	100·0
Mean of 7 years	31·1	34·5	34·2	0·2	100·0

It is, of course, to be understood that the figures in the above table only relate to the *immediate* results, as determined by the relative extent to which one or other of the parties succeed in enforcing their demands. The question of the ultimate effect of the stoppages on the welfare of the parties or of the community generally is an entirely different question.

Organization of Strikes and Lock-outs.

In the great majority of cases strikes are organized and controlled by trade unions. ***Influence of Trade Unions.*** It does not, however, follow from this that the growth of trade unionism has always fostered and encouraged strikes, there being evidence that in many trades the strengthening of organization has had the effect, not only of restraining ill-considered partial stoppages, but also of preventing more serious dislocations of industry by providing a channel for the expression of grievances and a recognized means of negotiating with employers. Much of the evidence given before the Royal Commission on Labour (1891–1894) tended to show that the growth of trade unions has the effect on the whole of lessening the frequency, though of widening the area, of disputes. The commission, moreover, laid down that the stage of industry in which disputes are likely to be most frequent and bitter is that in which it is emerging from the "patriarchal" condition, in which each employer governs his establishment and deals with his own men with no outside interference, but has not fully entered into that other condition in which transactions take place between strong associations fully recognizing each other. In this state of industrial organization bitterness is often caused by the insistence of the work-people on the "recognition" of their unions, and by the treatment of these unions by the employers as outside parties interfering and causing estrangement between them and the work-people actually in their employ.

Probably next to the patriarchal stage, in which each factory is a happy family, the industrial conditions most favourable to peace are when a powerful trade union is face to face with a representative employers' association, both under the guidance of strong but moderate leaders and neither feeling it beneath its dignity to treat on equal terms with the other. When, on the other hand, some or all of these conditions are absent, the growth of combinations may tend to war rather than peace.

Whether, however, trade unionism tends generally to encourage or to restrain strikes, the organization and policy of all trade-unions, as at present constituted, are based on the possibility of a collective withdrawal from work in the last resort. Dispute pay is consequently the one universal form of trade-union benefit. Though, however, in most of the disputes recorded the strikers are financially supported by some trade union, this is by no means always the case. Many strikes have been entirely carried out without the instrumentality of a permanent combination, the work-people affected belonging to no union and merely improvising a more or less representative strike committee to control the movement. It is not uncommon, however, for a permanent union to originate in a strike of non-unionists. In other cases (*e.g.* in the London dock strike of 1889) an insignificant trade union may initiate a strike movement involving several thousands of labourers outside its membership. In the case quoted the membership of the Dockers' Union rose during the few weeks of strike from 800 to over 20,000. A conspicuous case of a widespread strike of workmen not belonging to a trade union was the South Wales coal-miners' dispute of 1898. Of the 100,000 men affected, probably not more than 12,000 belonged at the time to any trade union, but the workmen's representatives on the committee of the sliding scale (against which the movement was directed) formed the nucleus of a strike committee, and one result of the strike was the formation of the "South Wales Miners' Federation," affiliated to the Miners' Federation. In the case of strikes of non-unionists, the strikers, of course, have to depend for their maintenance on their own resources or on the proceeds of public subscriptions. Frequently grants are made in their aid by sympathetic trade unions, and in the case of the South Wales dispute above referred to, several boards of guardians gave outdoor relief illegally to strikers who had exhausted their resources.

The majority of strikers, however, belong to trade unions and receive "dispute benefit," which usually consists of a weekly payment of from 10s. to 15s. In 1906 the sum expended by 100 of the principal trade unions in support of men engaged in disputes was £212,000. In years of big disputes this sum has been largely exceeded.

Although most strikes are controlled by trade unions, cases are comparatively rare in this country in which the central committee of a trade union takes the initiative and directs its members to cease work. More usually a local strike movement is initiated by the local workmen, and the central committee is generally empowered by the rules to refuse its sanction to a strike and to close it at its discretion, but has no authority to order it. In many unions a ballot is taken of the members of the districts affected before a strike is authorized, and a two-thirds (or even greater) majority, either of members or of branches, in favour of a stoppage may be required before the sanction of the central executive is granted. Some unions in their rules draw a distinction between strikes to enforce new conditions (*e.g.* a rise of wages, a restriction of hours or of overtime) and strikes to oppose the introduction of new conditions by the employers, greater freedom being allowed to the local members in the case of "defensive" than of "offensive" strikes.

Sometimes also the executive committee, while refusing their official sanction to a strike, and declining to allow the funds of the society to be used to support the strikers, may tacitly permit a local committee to take what action it pleases and to collect funds for the purpose. Some strong unions, however, especially those which have entered into general agreements with employers' associations, not only refuse financial support to an unauthorized strike, but even expel from their society strikers who refuse to obey their order to return to work. The Boilermakers' and Iron Shipbuilders' Union has more than once taken drastic action of this kind, even to the extent of fining or superseding recalcitrant members and officials. In 1899 the National Union of Boot and Shoe Operatives, which is a party to an agreement with the Employers' Federation (known as the "Terms of Settlement") was fined £300 by the umpire under that agreement for failing to expel or to induce to return to work certain of their members who took part in a strike contrary to the provisions of the agreement. It sometimes happens, however, that the central committee of a trade union is not strong enough to withhold financial support even from an unauthorized strike.[1]

When a strike has been authorized by the executive, the conduct of it is frequently entrusted to a "strike committee," appointed *ad hoc*, one reason being that a strike of any considerable dimensions often affects members of several unions, so that the common action necessary in a conflict with employers can only be attained by a committee representing all the societies involved. A strike committee has often no power to draw on the funds of the unions represented, each of which pays dispute pay in accordance with its rules to its own members, the financial power of the strike committee being limited to the support of non-unionists out of any funds available for the purpose, or the collection and administration of funds in case of the exhaustion of the resources of any of the unions represented.

The financial support of a local or sectional strike imposes but little strain on the resources of a large society, but where a considerable proportion of the members are affected it is usual for a union to replenish its funds by imposing a "levy" or special contribution on members remaining at work. During the engineering dispute of 1897–1898 the levies imposed by the Amalgamated Society of Engineers rose to 2s. 6d. per week, and one of the main objects of the federated employers was to diminish the revenue obtained from this source by enlarging the area of the dispute.

When there is no regular provision for the financial support of strikers, or when this provision is exhausted, the strike leaders have a much more difficult task in preventing the return to work of some of their followers; and it is in these cases that intimidation and violence are most to be apprehended. In all strikes, however, except in the few cases in which the whole of the workmen in the trade are in the union, and the skill required is such that no new labour can enter the trade during the dispute, there is the possibility of the strikers being replaced by other labour, and the efforts of the strike organizers are largely directed to the prevention of this by all means in their power. The chief method employed has generally been that known as "picketing," viz. the placing of members of the union to watch the approaches to the works or factories affected, to give information as to the strike to any workmen who attempt to enter, and to endeavour to dissuade them from accepting employment.

Other methods of preventing workmen from taking the place of strikers may also be adopted or attempted, ranging from the publication of information in leaflets or otherwise as to the existence of a dispute, or appeals to workmen to avoid the works affected, to systematic annoyance or intimidation of workmen who take or retain employment during a stoppage by threats or by actual violence and outrage.

[1] Noteworthy in this respect was the strike of boilermakers on the Tyne in 1910, in defiance of their executive.

The methods adopted by strikers and strike organizers naturally suggest the counter measures adopted by employers. To break down the resistance of a body of work-people supplied with a weekly strike allowance by a powerful trade union employers sometimes have recourse to some method of mutual indemnification by which the financially weaker of their number are temporarily subsidized by the stronger, whether through the machinery of a permanent employers' association or of an emergency committee. Employers' associations being usually composed of much smaller numbers than trade unions, are, as a rule, able to act in concert with greater secrecy and less formality than is possible in a workmen's union. Apart from any financial support which employers may guarantee their colleagues when attacked by a trade union, they have in some cases formed or aided organizations for the systematic provision of a reserve of "free labourers" available to replace men on strike. By "free labourers" is meant not necessarily non-unionist, but labourers pledged to work amicably with others whether members of a union or not. The Shipping Federation, an organization of shipowners and shipowners' associations which was formed in 1890 to combat the strikes than prevalent among seamen, arranged a system of shipping offices at which seamen could be engaged who were prepared to give a pledge that they would work with non-unionists. They also opened similar offices for shore labourers in some ports. Other independent agencies exist for supplying employers with labour during a dispute. It is not uncommon, in disputes in which there is any apprehension of intimidation or violence, for employers to board and lodge the imported work-people. Another method on which employers in recent years showed an increased tendency to rely was the institution of legal proceedings to restrain individual strikers or the union to which they belong from taking wrongful action injurious to their business. This led to the passage of the Trade Disputes Act of 1906 legalizing several forms of action by strikers which the courts had declared illegal (see below). There has been no attempt in England to induce the courts to restrain bodies of work-people from striking by injunction, as has been frequently done in American strikes affecting inter-state commerce. In many disputes the attitude of public opinion is of some importance in determining the results, and accordingly both sides frequently issue statements or manifestoes giving their versions of the difference, and in other ways (*e.g.* by an offer of arbitration) one party or the other endeavours to enlist public opinion on its side.

Free Labour.

Public Action with regard to Strikes and Lock-outs.

Though the majority of labour disputes have little importance for third parties, stoppages of this kind sometimes acquire a special interest for the general public either by reason of the large number of work-people whose livelihood is affected, or of their indirect effects on employment in kindred trades, or of the danger and inconvenience that may be caused to the public, or of the fear that industry may be diverted abroad, or that a breach of the peace may be caused by attempts on the part of the strikers to coerce persons outside their combinations. For these and other reasons, strikes and lock-outs are usually regarded as a class of disputes in which legislative interference has more justification than in the case of other kinds of industrial and commercial differences.

Legislative action, with the view of providing alternative methods of adjusting labour difficulties, is discussed in the article ARBITRATION AND CONCILIATION. It is there shown that in New Zealand, New South Wales, Western Australia, the commonwealth of Australia and Canada (for certain industries) alternative methods have been made compulsory, but there are indications that the great majority of employers and workmen in Great Britain would not be prepared for such measures, involving as they would the surrender by those directly concerned of their freedom to arrange these matters by voluntary agreement or by a trial of strength. Without the provision of some alternative by the state, it would be impossible in a free country to prohibit altogether the termination of labour contracts by collective agreement among work-people or employers.

The law, however, may and does restrict or prohibit the use of some of the methods of promoting or carrying on strikes which interfere with the liberty of other labourers, or inflict a wrong on employers, or injuriously affect the public interest.

Law of the United Kingdom dealing with Strikes.

The relation of the law in the United Kingdom to strikes and lock-outs is briefly as follows. Since the legislation of 1871 and 1875 there has been no question of the legality of a strike as such, viz. of a combined abstention from work in order to influence the conditions of employment, but the method in which the strike is carried out may subject the strikers either to criminal or civil liabilities. In this connexion the chief questions of interest relate to the limits within which strikers may lawfully act for the purpose of inducing other persons not to take their places, and for the purpose of bringing indirect pressure to bear upon the employer by influencing others not to work for or deal with him; and, on the other hand, the limits within which employers may act in inducing other employers to abstain from employing workmen or members of a trade union with whom they have a dispute.

Strikers are necessarily liable to the general criminal law, but the Conspiracy and Protection of Property Act 1875 enacted that an agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy if such act if committed by one person would not be punishable as a crime, namely, on indictment or on summary conviction with the statutory liability of imprisonment either absolutely or alternatively for some other punishment. The Trade Disputes Act 1906 extended the exemption to *civil* liability providing that an act done in pursuance of an agreement or combination in contemplation or furtherance of a trade dispute shall not be actionable unless the act if done without such agreement or combination would be actionable. This act also extended the definition of trade dispute so as to include disputes between workmen and workmen, and also to make it clear that the workmen referred to need not necessarily be in the employment of the employer with whom a trade dispute arises.

The act of 1875 does not affect any conspiracy punishable by statute nor the law relating to riot, unlawful assembly, breach of the peace or sedition, or any offence against the state or sovereign. The act also does not apply to seamen, or to apprentices to the sea service.

Sudden breach of contract of service in gas and water undertakings, or under circumstances likely to endanger human life or cause serious bodily injury, or expose valuable property to destruction or serious injury, are made punishable offences by special sections, but the miscellaneous provisions of the act are the most important in trade disputes. These provisions, as amended by the act of 1906, subject to a penalty of fine or imprisonment every person who, with a view to compel any other person to abstain from doing, or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority,

1. Uses violence to or intimidates such other person, or his wife or children, or injures his property; or
2. Persistently follows such other person about from place to place; or
3. Hides any tools, clothes or other property owned or used by such other person, or deprives him of or hinders him in the use thereof; or
4. Watches or besets the house or other place where such person resides, or works, or carries on business, or happens to be, or the approach to such house or place; or
5. Follows such other person with two or more other persons in a disorderly manner in or through any street or road.

It has, however, expressly provided by § 2 of the act of 1906 that "it shall be lawful for one or more persons, acting on their own behalf or on behalf of a trade union or of an individual employer or firm in contemplation or furtherance of a trade dispute, to attend at or near a house or place where a person resides or works or carries on business or happens to be, if they so attend merely for the purpose of peacefully obtaining or communicating information, or of peacefully persuading any person to work or abstain from working."

The above amendment of the law introduced by the act of 1906 was intended to nullify the effect of a series of recent decisions (of which *Lyons* v. *Wilkins*, 1896 and 1899, was the most important), which interpreted the act of 1875 to mean that all picketing was illegal except such as was merely for the purpose of obtaining or communicating information. Until recently it was supposed that for wrongs committed in strikes only the individual wrong-doers could be made responsible. But the decision of the House of Lords in the Taff Vale railway case (1901) showed that a trade union could be sued in tort for acts done by its agents within the scope of their authority and might be sued in its collective capacity, and execution of any damages recovered could be enforced against its general funds. The effect of this decision was nullified by § 4 (1) of the Trade Disputes Act of 1906, which expressly forbids any court to entertain any action against a trade union on behalf of all the members of the union in respect of any tortious act alleged to have been committed by or on behalf of the union.

Economic Effects.

The question of the effectiveness or otherwise of strikes and lock-outs for the purpose of influencing the conditions of employment is part of the wider question of the economic effect of combinations, the strike or lock-out being only one of many methods adopted by combinations of workmen or employers to enforce their demands. (This matter is discussed in the article TRADE UNIONS.) Apart, however, from the question of the extent of the immediate advantage, if any, which one party or the other is able to obtain from a stoppage, we have to consider generally the economic effects of strikes and lock-outs to the community as a whole. Stoppages of work are in their nature wasteful. Time, which might be employed in work yielding wages to the work-people and profits to the employers, is lost never to be recovered, while many forms of fixed capital deteriorate during idleness. In attempting, however, to estimate the utility or disadvantage of strikes and lock-outs, whether to the parties themselves or to the industrial community as a whole, it is insufficient to take into account the value of the wages and profits foregone during the stoppage, and to balance these against the gains made by one party or the other. Attempts have often been made to measure the loss or gain due to strikes in this way, but even as applied to particular stoppages, looked at purely from the point of view of one or other of the parties involved, the method is unsatisfactory. On the one hand, the time and work apparently lost may be afterwards partially recouped by overtime, or some of the strikers may be replaced by others, or may themselves find work elsewhere, so that the actual interruption of production may be less than would appear from the magnitude of the dispute. On the other hand, the total loss due to the stoppage may be augmented by the diversion of trade for a longer or shorter period after the resumption of work. Again, the ultimate effect of the forced concession of excessive demands may be damaging instead of advantageous to the nominal victors, by contracting the field of employment or by lowering the efficiency of the labour. If, however, the arithmetical computation of the value of the time lost compared with the value of the terms gained is an unsatisfactory test of the benefit or disadvantage of a particular strike to the parties concerned, it is wholly fallacious as a method of estimating the social utility or otherwise of strikes and lock-outs as instruments for effecting changes in the condition of employment. For any satisfactory consideration of this wider question we must look not merely to the actual strike, but to the whole process of free bargaining between employers and organized bodies of work-people, of which, as already shown, the strike may be regarded as merely an untoward incident. The actual cessation of work is a symptom that for the time there is a deadlock, and frequency of such cessations in any trade is a sign of the imperfection of means of negotiation. In many trades in which both employers and workmen are strongly organized various forms of machinery have been brought into existence for the purpose of minimizing the chance of stoppages (see ARBITRATION AND CONCILIATION). But wherever there is free combined negotiation there is always in the background the possibility of combined stoppage. This being understood, the question of the utility of strikes as an industrial method resolves itself into the questions: (1) Whether the process of settling the terms of employment by agreements affecting considerable bodies of work-people and employers is superior to the method of individual settlements of labour contracts, or, at least, whether its advantages are sufficient to outweigh the cost of strikes and lock-outs; (2) whether free collective negotiation could be replaced with advantage by any other method of settling the conditions of employment of bodies of work-people, which would dispense with the necessity of testing the labour market by a suspension of work.

1. The first of these questions is virtually the question of the advantages and disadvantages to the community of combinations of workmen and employers, which is discussed at length in the article TRADE UNIONS. As regards the question of the direct cost of strikes and lock-outs, it is proper to remember that individual bargaining does not do away with stoppages; in fact, the aggregate amount of time lost in the process of adjusting ten thousand separate labour contracts may be considerable—possibly not less than that consumed on an average in effecting a single agreement involving the whole body, even if the chance of a collective stoppage of work occurring during the process of combined bargaining be taken into account.

While, then, the strikes and lock-outs which accompany the system of combined bargaining are rightly to be described as wasteful, this is not so much because of the excessive amount of working time which they consume, as because of the disturbance and damage done to industry by the violent breach of continuity—a breach which may dislocate trade to an extent quite disproportionate to the actual loss of time involved, and the fear of which undoubtedly affects the minds of possible customers and hampers enterprise on the part of employers. The extent of the injury directly inflicted on the consuming public by a strike varies greatly in different cases, being at its maximum in the case of industries having the total or partial monopoly of supplying some commodity or service of prime necessity, *e.g.* gas-works, water-works, railway or tramway service; and least in the case of a local stoppage in some widely-spread manufacturing or constructive industry open to active competition from other districts.

In speaking above of the loss occasioned by strikes and lock-outs attention has only been paid to the effects of the actual stoppage as such, and not to the particular methods adopted by the strikers to make the stoppage effective. The evils arising from the practice of intimidation or violence towards other workmen, or from the increase of class-hatred and bitterness engendered by the strike between employer and employed, are patent to all, though they cannot be estimated from an economic point of view.

2. As to the second question, viz. the possibility of maintaining combined negotiation, but of substituting some better method than strikes of resolving a deadlock, it is hardly necessary to say that so far as such substitution can be voluntarily carried out with the assent of both parties, whether by the establishment of wages boards or joint-committees, or by agreements to refer differences to third parties, the result is an economic as well as a moral advantage.

But the increasing adoption of these voluntary expedients for diminishing the chance of industrial friction lends no countenance to the expectation that a satisfactory universal substitute for strikes and lock-outs can be devised except at the price of economic liberty. Compulsory reference of disputes to a state tribunal cannot be reconciled with freedom of voluntary negotiations.

Unless, then, we are prepared for a scheme of compulsory regulation of industry by the state, strikes and lock-outs must be accepted as necessary evils, but their frequency may be greatly diminished with the improvement of means of information as to the true condition of the labour market, and the influences by which it is determined. Many disputes arising purely from mismanagement and misunderstanding are wholly avoidable. While there is no warrant for expecting the total abolition of strikes and lock-outs, it is not unreasonable to hope that the spread of education and the means of rapidly obtaining information, the improvement of class relations, and the adoption, where practicable, of conciliatory methods, may gradually tend to confine actual stoppages to the comparatively few cases in which there is a genuine and serious difference of principle between the parties.

Important British Strikes and Lock-outs.

Some of the more important labour disputes which have occurred in various groups of trades in the United Kingdom are noted below. With regard to the statistics given, it may here be noted that although for the sake of brevity it is stated in some places that a certain number of men were idle for a specified number of days, it must not be supposed that in all cases the whole number affected were idle for the whole number of days.

Coal-Mining is an industry which has always been more convulsed by labour disputes than any other, probably owing to the violent oscillations of prices and wages, and to the varied and ever-changing conditions under which work is carried on. Several of the earliest recorded disputes among coal-miners, however, referred to the term of engagement rather than the rate of wages. In 1765 the Northumberland miners struck for several weeks unsuccessfully against the system of a yearly bond of service, which was then prevalent. In 1810 a strike of seven weeks in the same district against a variation of the yearly bond ended in a compromise. Turbulent strikes in Northumberland and Durham are also recorded in 1831 and 1832; the former, in which the men were successful, for a general removal of grievances, and the latter, in which they were defeated, for the maintenance of the union. These strikes were attended with violence and destruction of property. In 1844 still another prolonged strike took place in the north of England to enforce alterations in the terms of the yearly bond. From 30,000 to 40,000 men were out for 18 weeks. New men, however, were obtained, and there were many evictions. In 1864 widespread strikes took place in South Yorkshire and South Staffordshire, the one for an advance and the other against a reduction of wages. The Yorkshire strike is said to have affected 37,000 men, and the Staffordshire strike 20,000. The latter lasted over four months.

The rapid fall in the price of coal after the abnormal inflation in 1871–1872 produced a series of obstinate strikes and lock-outs arising out of reductions of wages, in which the men were usually defeated. The South Wales miners, to the number of 70,000, were out for 11 weeks in 1873 and for 19 weeks in 1875, the latter dispute being a combined strike and lock-out, and leading to the formation of the first of the series of sliding scales under which the industry in South Wales was regulated until the end of the year 1902. In 1877 the West Lancashire miners (30,000) were out for 6 weeks, and the Northumberland men (14,000) for 8 weeks. The last-mentioned dispute was terminated by an arbitration award in the miner's favour. In 1879, 70,000 Durham men were out for 6 weeks, the dispute being terminated by an arbitration award giving half the reduction claimed by the coal-owners. The introduction of sliding scales in Durham and Northumberland in 1877 and 1879 did something to preserve peace in those districts, though the Durham scale did not prevent the dispute of 1879 mentioned above. Both scales, however, were terminated by the men in 1889 and 1887 respectively. In 1880–1881 the Lancashire coal-mining industry was stopped for 7 weeks by a strike of 50,000 to 60,000 men against "contracting out" of the Employers' Liability Act of 1880.

The fall of prices after 1890 led to a renewal of disputes. In 1892 there was a prolonged stoppage in the Durham coalfield, 75,000 men being out for about 11 weeks.

In 1893 the greatest dispute took place that has ever been recorded in the coal-mining industry, affecting the whole area covered by the Miners' Federation, viz. Yorkshire, Lancashire and Cheshire, and the Midlands. During the years 1891 and 1892 most of the districts covered by the Miners' Federation submitted to reductions of wages varying from 15% off the standard in Durham to 42½% in South Wales and 50% in Scotland, where the previous rise had been greatest. The Miners' Federation, however, refused to recognize the principle that wages should follow prices, and put forward instead the theory that a minimum or "living wage" should be fixed and prices left to adjust themselves to this rate. They declined altogether to agree to any reduction, and so strong was their combination that the coal-owners deferred any definite action until the middle of 1893, when they considered that some reduction was absolutely necessary to enable the trade to be carried on. On the 30th of June they passed a resolution after a conference with the men, demanding a reduction of 25% off the "standard" (equivalent to about 18% off current rates of wages), and offered arbitration as an alternative; but the federation absolutely refused any reduction, and the contest began. Shortly before the beginning of the dispute Northumberland and Durham had become affiliated to the federation, but these districts were not threatened by a reduction, and they seceded from the federation sooner than strike, as demanded by that body to obtain the return of the reductions sustained since 1891. These districts consequently remained at work throughout the dispute, as well as Scotland and (except for a part of August and September) South Wales, reaping the advantage of the increased prices and wages resulting from the restriction of production due to the stoppage.

Within the federation districts proper there were some localities in which no notices of reduction were posted, but the policy of the Miners' Federation was to make the stoppage as universal as possible, and all its members were required to leave work. The Cumberland miners, however, though members of the federation, were for special reasons permitted to continue at work. By the middle of August nearly 300,000 men were idle, or nearly half the total number of coal-miners in the United Kingdom. The early stages of the dispute were uneventful, but as the funds of the unions affiliated to the federation became exhausted, and the pinch of distress was felt, feeling ran high, and in some districts deplorable acts of violence were committed. At Featherstone, in Yorkshire, an attack was made on a colliery, in the course of which the military fired on the rioters, two of whom were killed.

The decision of the federation requiring all its members to leave work, whether under notice of reduction or not, had from the beginning met with considerable opposition in certain districts, and this opposition naturally grew stronger as the distress caused by the stoppage increased. At the end of August a ballot on the question showed a small majority still in favour of a universal stoppage, but the experience of another month led to a formal reversal of policy in this respect, a meeting of the federation at Chesterfield on the 29th of September deciding to allow all men to return to work who could do so at the old rates of pay, such men to pay a levy of 1s. a day in aid of those still on strike. Up to October no step was taken towards a settlement beyond an offer on the part of the miners on the 22nd of August to pledge themselves not to ask for an advance until prices reached the 1890 level, and also to assist the employers to prevent underselling—an offer which was rejected by the coal-owners. On the 9th of October a meeting of the representatives of the parties was held at Sheffield, at the invitation of the mayors of six important towns affected, but without definite result, beyond leading to an amended proposal on the part of the coal-owners for an immediate 15% reduction, and the regulation of future changes in wages by a conciliation board. The men, however, still refused all reduction, and during October a number of coal-owners, especially in the Midlands, threw open their pits at the old rate of wages.

A further advance towards a compromise was made by the owners on the 25th of October, when they offered that the proposed 15% reduction should be returned to the men in the event of the conciliation board (with an independent chairman) deciding in their favour. In consequence of this offer a meeting was held between the representatives of the owners and the men in London on the 3rd and 4th of November, but without arriving at a settlement. Matters had now reached a deadlock, and accordingly, on the 13th of November, the government addressed an invitation to both parties to be represented at a conference under the presidency (without a casting vote) of Lord Rosebery, who was then foreign secretary. The conference took place at the foreign office on the 17th of November, and resulted in a settlement, the men to resume work at once at the old rate of wages, to be continued until the 1st of February 1894, from which date wages were to be regulated by a conciliation board, consisting of fourteen representatives of the coal-owners' and miners' federations respectively, with a chairman mutually elected, or in default nominated by the Speaker of the House of Commons, the chairman to have a casting vote.

This agreement terminated the dispute. The Speaker appointed Lord Shand as chairman of the board. In the middle of the following year, by mutual arrangement, the constitution of the conciliation board was modified so as to provide for limits below and above which wages should not move during a definite period. These limits have since been modified from time to time, but (with a gap from July 1896 to January 1899) the conciliation board continued to regulate miners' wages in the federated districts, and its formation has been followed by the institution of conciliation boards in most of the other important centres of the mining industry.

During the summer of 1893 there was also a strike of about 90,000 men in South Wales, which lasted about 5 weeks. 1894 saw a prolonged dispute in the Scottish coal-mining industry, the men vainly attempting to resist the fall of wages which followed the fall of coal prices from the abnormal level to which they had risen during the English stoppage of the previous year; 70,000 men were out from 15 to 16 weeks. In 1898 there was an unsuccessful stoppage lasting 25 weeks in South Wales and Monmouth affecting 100,000 men, for the abolition or amendment of the sliding scale agreement. In 1902 the dissatisfaction of the pit-lads with a reduction of wages awarded by the conciliation board threw a large body of miners idle for some time in various parts of the "federated districts." In 1906 a series of local strikes occurred in South Wales in order to compel non-unionists to join the Miners' Union, while in 1910 strikes in the Tonypandy district led to much rioting.

The record of strikes and lock-outs in the *Cotton Trade* goes back to a time before the repeal of the Combination Laws. Thus the year 1810 was marked by lock-outs of spinners in Lancashire and Glasgow, the former caused by a strike in the Stalybridge district to enforce Manchester rates of wages, and the latter having for its object the break-up of the men's union. In both cases the employers were successful. In 1812 there was a stoppage of 40,000 looms in Scotland for some weeks, arising out of a wages dispute, in which the men were beaten, their union broken up, and their leaders imprisoned. Another unsuccessful strike attended with imprisonment of the men's leaders took place among the Manchester spinners in 1818, when 20,000 to 30,000 men were out for three or four months to obtain an advance of wages and reduction of hours. The year 1853 was one of great disturbance in the Lancashire cotton-spinning trade. For seven months 20,000 to 30,000 spinners in the Preston district were engaged in an unsuccessful strike for an advance of wages, and in the same year there was a stoppage of 65,000 spinners in Lancashire generally. The period of bad trade culminating in 1879 was marked by bitter disputes in the cotton trade, the men vainly trying to resist the reductions of wages which marked that period. Partial disputes at Bolton in 1877, and Oldham in 1878 were followed in the latter year by a general stoppage in north and north-east Lancashire affecting 70,000 persons for 9 weeks. The general dispute was attended with violent riots, and 68 persons were tried and convicted. The next important dispute was a strike of 18,000 weavers in north-east Lancashire in 1884 against a reduction of wages, which ended after 8 weeks in a compromise. Next year there was a strike at Oldham against a reduction of wages affecting 24,000 persons in the spinning and weaving branches. The dispute ended in a compromise, half the proposed reduction of 10% being agreed to. In 1892–1893 a great dispute in the cotton-spinning trade took place, 50,000 persons in the Oldham and surrounding districts being out for 20 weeks against a proposed reduction of 5%. The dispute was ended by the so-called "Brooklands Agreement," which provided for a reduction of about 3%, and also contained rules for the settlement of future disputes by conciliatory methods. These rules do not, however, provide for a final appeal in cases of deadlock. A considerable strike in 1910, brought about by a dispute as to the allocation of duties of a single operative, was terminated by the intervention of the board of trade.

The *Building Trades* have in most years been characterized by a large number of local and sectional disputes sometimes affecting comparatively small bodies of men. Often, however, all branches of building trades in a given district have been stopped simultaneously, but few of the building trade stoppages have affected a sufficiently large body of men to be noticed here as important disputes except in London. The years 1810 and 1816 were marked by strikes on the part of the London carpenters, the first being a successful attempt to obtain a rise in wages, the second an unsuccessful resistance to a fall. In 1833 an important dispute laid idle the building trades of Liverpool and Manchester. The dispute arose out of the objection of the men to the contract system, and led to a general lock-out to compel the men to leave their unions, in which the employers were generally successful. In 1859–1860 a partial strike in London against the discharge of a delegate led to a lock-out of 25,000 building operatives for 7 months, and in 1861–1862 a renewed strike for a reduction of hours resulted in a compromise. In 1872 there was a successful strike of 10,000 London building operatives for a rise of wages, a shortening of hours being also obtained. In 1891 there was an unsuccessful strike of carpenters in London for a rise in wages, affecting 9000 men and lasting 24 weeks.

Engineering, Shipbuilding and Metal Trades.—Among the most noteworthy disputes in the engineering trade was that in 1852, soon after the formation of the Amalgamated Society of Engineers by the fusion of a number of local and sectional societies. The dispute originated in Lancashire, and turned on demands from the men for the abolition of piecework and overtime, the dispute being further complicated by questions relating to the employment of labourers in working machines. The men ceased working overtime, and were locked out to the number of over 13,000 for periods ranging from three to nine months. The men were completely beaten, and many engineering shops required the men to leave the union before resuming work. In 1871 a strike of 8000 to 9000 men in the north of England for a reduction of hours from 59 to 54 was successful after a stoppage of 20 weeks, and led to the general introduction of the nine-hour-day throughout the country.

In 1897–1898 there was a widespread and prolonged dispute turning on questions of hours and of freedom of management of works, which lasted 29 weeks and affected 47,500 men. The immediate occasion of the stoppage was a demand on the part of the men for an eight-hour-day in London workshops, but this issue was soon overshadowed in importance by other questions relating to the freedom of employers from interference by the unions in the management of their business, especially in such matters as piecework, overtime, selection and training of workmen to work machines, employment of unionists and non-unionists, and other matters affecting the relations of employer and employed generally throughout the United Kingdom. For some time previous to the general dispute there had been a growing dissatisfaction on the part of the employers with the encroachments of the Amalgamated Society of Engineers and other societies in kindred trades on matters affecting the management of business, which the employers considered to be outside the legitimate functions of trade unions. In the absence of any general combination of employers, the unions were able to bring their whole force to bear on employers in particular localities, with the result that the stringency of the conditions and restrictions enforced varied very greatly in different districts, according to the comparative strength of the unions in those districts. Employers complained of being subject to vexatious restrictions not imposed on their competitors, and they declared that they were severely handicapped as compared with America and other countries, where engineering employers had much more complete control over the management of their business. In 1895 was formed the Federation of Engineering Employers by the coalition of the local associations on the Clyde and in Belfast, and this federation gradually spread to other districts until it finally embraced the United Kingdom generally. The policy of the federation was to defeat the attempts of the unions to put pressure on particular individuals or localities by the counter-threat of a general lock-out of trade unionists over a wide area in support of the employers thus attacked. The lock-out notices were framed in such a way that 25% of the trade unionists employed were to be discharged at the end of each week until the whole were locked out. Lock-out notices of this kind were twice posted—in August of 1896 and in the spring of 1897—before the general dispute, but in each case the dispute was averted before the notices took effect. But the conferences which took place in April 1897 between the representatives of employers and unions led to no agreement except on comparatively unimportant points. When, therefore, in June 1897 the London employers, threatened with a strike for an eight-hour-day, put their case in the hands of the Employers' Federation, and the federation determined to support them by a general lock-out, it was understood that this lock-out was enforced, not only in order to resist the reduction of hours in London, but to obtain a settlement of all the important questions at issue between the federation and the unions as a whole. The engineers replied to the notices of a gradual lock-out by withdrawing the whole of their members from work in federated workshops. At first the lock-out affected some 25,000 men employed in 250 establishments, but by the close of the dispute the number of employers involved had risen to 702, and of work-people to 47,500.

Until November no meeting between the parties took place, but on the 24th of November and following days a conference was held in pursuance of negotiations with the parties by the board of trade, each side having its own chairman. The main point for which the employers contended was freedom on the part of each employer to introduce into his workshop any condition of labour under which any members of the trade unions were working in any of the federated workshops at the beginning of the dispute, except as regards rates of wages and hours of labour. Arising out of this general principle of freedom of management, a number of special points were discussed and subsequently embodied in separate articles of the provisional agreement, and a system of local and general conferences for the settlement and avoidance of future disputes was also included therein. The employers absolutely declined to grant any reduction of hours of labour. The negotiations dragged on for a considerable time, and were at one time broken off owing to the refusal of the men to ratify the provisional agreement. By the end of the year, however, it was evident that the position of the men was very much weakened owing to the depletion of their funds, while that of the employers was stronger than ever. On the 13th of January the London demand for an eight-hour-day was formally withdrawn, and after some further negotiation, and the embodiment in the agreement of the notes and explanations published by the employers, a settlement was arrived at and ratified by more than a two-thirds majority of the men, the final agreement being signed on the 28th of January.

The victory of the employers was complete, but the use made of it was moderate, and the relations between employers and workmen in the engineering trades on the whole improved, all matters likely to cause dispute being now amicably discussed between the representatives of the respective associations.

In 1866 a strike of 3000 shipwrights on the Clyde led to a general lock-out of shipbuilders in the district. In 1877, 25,000 iron shipbuilders on the Clyde struck for 23 weeks for an advance of wages, the dispute being settled by arbitration.

In 1906 the shipbuilders in the Clyde district struck work for about 7 weeks to obtain an advance of wages of 1s. 6d. a week. The dispute ended in their defeat, about 15,000 men being affected.

In 1891 a prolonged dispute took place between the plumbers and engineers engaged in shipyards on the Tyne as to "demarcation"; 2460 men were idle from 7 to 8 weeks, the result being the drawing up of an elaborate list of apportionment applicable to the Tyne and Wear. The shipbuilding trades have from early times been marked by numerous "demarcation" disputes, mostly of a local character, as to the limits of the work of the various bodies of work-people—*e.g.* between shipwrights and boatbuilders; shipwrights and joiners; shipwrights and boilermakers; joiners and cabinetmakers; boilermakers and engineers; engineers and plumbers; engineers and brassfinishers. Some of these matters are now dealt with by joint trade boards (see ARBITRATION AND CONCILIATION).

Among the more important disputes in the iron trade are to be mentioned a strike and lock-out of 30,000 ironworkers in Staffordshire in 1865, in which the men were beaten after a costly stoppage of 18 weeks; an unsuccessful strike of 12,000 ironworkers in Middlesbrough for 18 weeks in 1866; and an unsuccessful strike of 20,000 ironworkers in Staffordshire for 4 weeks in 1883 against a reduction of wages, attended by rioting and destruction of plant.

The nailmakers in the Dudley district engaged in widespread disputes in 1840, 1881 and 1887. The strike of 1840 against a reduction of wages was unsuccessful. Those of 1881 and 1887 were for advance of wages; the former was wholly, the latter partially successful. The women chain-makers of Cradley Heath successfully struck in 1910 for an increase of wages.

Other Trades.—Among other noteworthy disputes are to be mentioned:—

1. A successful strike of 14,000 persons in the Leicester hosiery trade in 1819 for an advance in wages.

2. An unsuccessful strike of 13,000 or more tailors in London in 1834 for a rise of wages and reduction of hours, lasting several months.

3. A dispute among the pottery workmen in the Midlands in 1836 against the terms of yearly hiring, leading to a general lock-out of over 15,000 men for 10 weeks, which ended in the defeat of the men.

4. A series of disputes among agricultural labourers in 1872–1874 for increases of wages and other improvements in the conditions of employment, in which the men were mostly successful. These disputes, which are almost the only widespread disputes recorded in agriculture, evoked much public interest.

5. In 1889 there was a prolonged strike of dock and waterside labourers in London for a rise in wages and other alterations in conditions of employment, which was successful, mainly through the financial support received from the Australian trade unions and from the general public. It began on the 13th of August with a small local dispute at the West India Docks about the wages earned for discharging a certain cargo, but spread rapidly among all classes of dock labourers in the port, who took the opportunity of demanding an increase in the rate of pay for time work from 5d. to 6d., the abolition of contract and piece-work, and the remedy of other grievances. They were joined by the stevedores and lightermen, who came out "in sympathy," though the latter class of men soon formulated a set of demands of their own. Employment was brisk, the weather fine, and the public sympathetic, and in a few days' time not less than 16,000 men were idle. For the most part they were unconnected with trade unions which could give them strike pay, but during the month that the strike lasted the public at home and abroad subscribed nearly £50,000 in support of the strikers. Of this total over £30,000 came from Australia, where from the 29th of August onwards a series of meetings were held for the purpose of raising funds to assist the London labourers. The Australian subscriptions practically decided the issue of the contest. On the very day on which the first Australian meeting was held at Brisbane the leaders of the strike attempted by means of a "no-work manifesto" to widen the area of the dispute and cause a general stoppage of industry. Though this attempt was soon abandoned it caused considerable alarm and threatened to alienate public sympathy from the men. Early in September many of the wharfingers made separate settlements with the strikers, and the shipowners attempted to put pressure on the dock companies to allow them to employ labour direct within the docks. The apprehensions of the public led to the formation of a conciliation committee at the Mansion House, including the Lord Mayor, the bishop of London, Cardinal Manning, Sir John Lubbock (Lord Avebury), and others, who mediated between the strikers and the dock directors, with the result that after one abortive attempt at a settlement, the terms of which were rejected by the men, an agreement was arrived at on the 14th of September, under which the dock labourers obtained the greater part of their demands. From the 4th of November the rate of hourly wages for time work was raised to 6d., with 8d. overtime; contract work was converted into piece-work, with a minimum rate of 6d., and other points in dispute were settled. Though during the strike cases of intimidation and violence on the part of pickets were by no means absent, the police-court charges arising out of the dispute were remarkably few. By the end of the year the Dock Labourers' Union (which had previously been known as the Tea Operatives and General Labourers' Union, and at the beginning of the dispute numbered about 800 members) had increased its membership in London to over 20,000—a number which was afterwards further increased by the formation of provincial branches. In London, however, the membership rapidly declined during the following years of depression of trade. The stevedores, who, as above remarked, came out "in sympathy" with the dock labourers, returned to work as soon as the latter were satisfied, but the lightermen's demands were adjusted by an award of Lord Brassey before they returned to work.

6. The organization of labour at the principal ports which followed this dispute led to a series of struggles between the new unions and the shipowners, who formed an organization called the Shipping Federation Limited, and successfully established their right to employ "free labour" in opposition to the unions of seamen and other bodies of labourers. The last of these disputes on a large scale occurred at Hull in 1893, and ended in the defeat of the dock labourers after a stoppage affecting 11,000 men for 6 weeks.

7. In 1895 a general stoppage of 46,000 boot and shoe operatives was terminated, after a stoppage of 6 weeks, by a settlement effected through the board of trade. The issues of this dispute were of

interest as involving the scope and limits of the functions of trade union action and of arbitration in relation to the management of business. The terms of settlement, which were of an elaborate character, are still in operation.

8. Two prolonged disputes at Lord Penrhyn's slate quarries in North Wales in 1896 and 1900 attracted public notice from the obstinacy with which the contests were conducted on both sides. About 2500 work-people were affected, and the questions at issue were the recognition of the men's combination and the remedy of a number of alleged grievances, including the abolition of the contract system. After 48 weeks' stoppage, during which the board of trade vainly tried to mediate, the first dispute was ended by a compromise; but in 1900 another struggle began which was persisted in by many of the men until November 1903, but without success.

Foreign Countries.

Below is given a brief account of the most recent strike statistics in the principal countries other than the United Kingdom, except those of the United States, which are dealt with in a separate section.

France.—Detailed statistics of strikes and lock-outs in France have been published annually since 1890 by the French office du travail. The following are the figures for 1900–1906:—

Year.	Number of Disputes.	Number of Work-people directly affected.	Aggregate Duration in Working Days.
1900	903	222,769	3,761,227
1901	523	111,414	1,862,050
1902	512	212,704	4,675,081
1903	571	123,957	2,443,219
1904	1,028	271,267	3,936,774
1905	835	178,252	2,785,167
1906	1,314	439,280	9,445,420
Mean of 7 yrs.	812	222,806	4,129,848

The principal groups of industries affected by disputes were in 1900 and 1901 the transport, involving 47,125 and 36,636 work-people respectively; in 1902 the mining and quarrying, involving 119,181 work-people; in 1903 the textile manufacturing industry, involving 76,376 work-people; in 1904 the textile manufacturing industry, involving 76,293 work-people; the transport, involving 69,293 work-people, and the agricultural, forestry and fishing group, involving 52,333 work-people; in 1905 the building and metal trade groups of industries, involving about 32,000 work-people in each; and in 1906 the building, metal and mining quarrying groups of industries, involving about 90,000 work-people in each.

In the French statistics of causes of disputes a dispute due to several causes is entered as many times as there are causes, not merely under its principal cause, as in the United Kingdom statistics. It would be possible to summarize the relative prevalence of different groups of causes of trade disputes by the numbers involved, but it is sufficient to say that the results during the period 1900 to 1906 were as follows: 12% in favour of the work-people, 25% in favour of the employers, and 63% compromised. A general strike of railway employees all over France in 1910 threatened to spread to other industries and caused an acute political crisis, but the energetic measures taken by M. Briand's government, especially the issue of mobilization orders to all the reservists on the affected lines, brought about its collapse in little more than a week.

Germany.—Before 1899 there were no official statistics of strikes and lock-outs throughout the German Empire, but certain figures were collected and published by the committee of the "Gewerkschaften," or Social Democratic trade unions, in their *Correspondenzblatt.* These figures, however, were admittedly incomplete. From 1899, however, statistics have been published by the German imperial statistical office for strikes and lock-outs other than in agriculture.

The figures from 1901 are summarized below:—

Year.	Number of Disputes terminating in the year.	Number of Work-people directly and indirectly affected.
1901	1091	68,191
1902	1106	70,696
1903	1444	135,522
1904	1990	145,480
1905	2657	542,564
1906	3626	376,415
1907	2512	286,016

In 1905, 232,425 work-people employed in the mining and smelting group were involved in disputes, and in 1906 and 1907 102,888 and 90,890 work-people employed in the building group of trades were so involved.

In the German statistics disputes are counted more than once if due to more than one separate cause. Of the total number of disputes tabulated in this way during the period 1901–1907, 56% were on questions of wages, 15% on questions of hours, 10% on questions of the employment of particular classes of persons and the balance on questions of working rules and other causes.

During the same period 20% of the disputes were settled in favour of the work-people, 45% in favour of the employers, and 35% were compromised.

Belgium.—The following figures are based on reports published by the Belgian labour department.

The table given below shows the number of strikes and the number of work-people directly affected by strikes in each of the years 1901 to 1907.

The mining industry and the transport trades accounted for 20,813 and 15,063 of the work-people affected in 1901, and the mining industry and the textile industry accounted for 59,168 and 7975 of the work-people in 1905. In 1906 the mining industry accounted for 12,189 of the work-people affected, and in 1907 the transport trades accounted for 10,660, the mining industry for 9626 and the textile industry for 7961 of the work-people affected. The causes of the strikes during the period were mainly questions of wages, nearly 80% of the work-people being involved on this account, and the results were mainly in favour of the employers, viz. 71%. Of the total number of work-people affected by strikes in the period 1901–1905 68% returned to work on employers' terms without negotiation. From 1906 particulars are given of lock-outs and of the number of work-people indirectly affected by strikes.

	1901.	1902.	1903.	1904.	1905.	1906.	1907.
Number of strikes	117	73	70	81	133	220	227
Number of work-people directly affected by strikes	43,814	10,477	7,649	12,375	75,672	26,858	46,908

In 1906 five lock-outs were recorded, all in the textile industry, affecting 23,621 work-people, and in 1907 four lock-outs were recorded affecting 16,274 work-people (one of these lock-outs affecting 16,000 work-people employed in the transport trade).

The number of work-people indirectly affected by strikes was 11,468 in 1906 and 19,248 in 1907.

Sweden.—The Swedish labour department has published statistics of strikes since 1903. There were in 1903 142 disputes directly affecting 22,568 work-people, in 1904 215 disputes directly affecting 11,485 work-people, in 1905 175 disputes directly affecting 32,368 work-people, in 1906 277 disputes directly affecting 18,612 work-people, and in 1907 298 disputes directly affecting 21,722 work-people. Of the 1107 disputes recorded in the five years 691 were caused by questions of wages. Of the 1107 disputes 362 ended in favour of the work-people, 272 in favour of the employers, and 395 in a compromise. In 1909 there was a great national strike involving almost every industry, and lasting some six months.

Denmark.—The statistics of disputes in Denmark are published by the Danish statistical bureau. During the period 1900 to 1906 the number of disputes varied from 57 in 1901 to 89 in 1906, and the number of work-people directly affected, from 7606 (involved in 68 disputes) in 1900 to 1148 (involved in 43 disputes) in 1903. The number of work-people shown is the maximum number affected at any one time, but the number involved is not obtained for all disputes. Of the total number of disputes which took place during the seven years' period 1900–1906, viz. 518, 53% were caused by questions of wages, 3% by hours of labour, 7% by working arrangements, rules, &c., 6% by questions of trade unionism, and 31% by other causes or causes unknown.

Holland.—Statistics of disputes in Holland are published by the central statistical bureau. During the three years 1904, 1905 and 1906 the number of disputes recorded were 102, 132 and 181 respectively, and the number of work-people directly affected 11,186, 7364 and 18,858 respectively, but the number of work-people affected was not ascertained in every dispute. The causes of disputes are measured by the number of days lost by the work-people directly affected (though these particulars were not obtained for all disputes), and the days lost by disputes which had more than one cause are included under each cause or object. In 1904 25%, in 1905 53% and in 1906 51% of the time lost was caused by questions of wages. The results of disputes in the three years are shown in the following table:—

Result.	Number of Disputes.		
	1904.	1905.	1906.
In favour of work-people	24	25	35
In favour of employers	43	49	63
Compromised	31	55	68
Indeterminate or unknown	4	3	7
Total	102	132	173

The figure for 1906 does not include 8 "sympathetic" disputes which came to an end when the original dispute terminated in connexion with which they occurred.

Austria.—Particulars of strikes and lock-outs are published by the Austrian labour department.

The following table shows the number of strikes, the number of strikers and non-strikers affected, the number of working days lost by strikers, and the number of lock-outs and work-people involved in each of the seven years 1900 to 1906.

	1900.	1901.	1902.	1903.	1904.	1905.	1906.
Number of strikes	303	270	264	324	414	686	1,083
Number of work-people taking part in strikes	105,128	24,870	37,471	46,215	64,227	99,591	153,688
Number of non-strikers affected	7,737	2,846	6,354	5,245	9,301	11,340	13,098
Number of working days lost by strikers	3,483,963	157,744	284,046	500,567	606,629	1,151,310	2,191,815
Number of lock-outs	10	3	8	8	6	17	50
Number of work-people directly involved in lock-outs	4,036	302	1,050	1,334	23,742	11,197	67,872

In the tabulation of causes or objects of disputes the work-people are entered as many times as there are causes. During the period 1900 to 1906 questions of wages were the predominating cause of dispute.

Twenty-five% of the work-people were involved in disputes during 1900 to 1906 which resulted in favour of the employers, 13% in disputes which resulted in favour of the work-people, and 62% in disputes which were compromised.

The British Colonies.

Canada.—Statistics of disputes are published by the department of labour. During the seven years 1901 to 1907 the total number of disputes recorded was 859, the number each year being as follows:—

1901.	1902.	1903.	1904.	1905.	1906.	1907.
104	123	160	103	87	138	144

In 1904 the number of work-people involved was 15,665; in 1905, 16,127; in 1906, 26,014 and in 1907, 34,972. The number of working days lost during the same four years were 278,956, 284,140, 489,775 and 613,986 respectively. Of the total number of disputes in the seven years (859), 208 occurred in the building trades, 139 in the metal trades, 79 in the clothing trades, 62 in the mining industry, 60 in the transport trades and 48 in the food and tobacco preparation industry. Of the 740 disputes occurring in the same period for which a cause could be tabulated, 248 were for an increase in wages, 94 against the employment of particular persons, 64 were for both an increase in wages and a decrease in hours of labour, and 45 against a reduction in wages; and of the 841 disputes for which the result could be tabulated, 293 were in favour of the employers, 250 were in favour of the work-people, 200 were settled by compromise, and the balance (98) were indefinite in their settlement. Four of the Canadian provinces, Ontario, Nova Scotia, British Columbia and Quebec, and the Dominion government have enacted laws with a view to the peaceful settlement of industrial disputes. Under the Industrial Disputes Investigation Act of 1907 strikes and lock-outs are unlawful in industries termed public utilities prior to or during a reference of such dispute to a board of conciliation, a provision which is enforced by heavy penalties. Thirty days' notice of intended changes in wages or hours have to be given under the act.

Australia and New Zealand.—Four of the Australian states (Victoria, New South Wales, South Australia and Western Australia) and the Commonwealth as a whole have enacted laws with a view to the peaceable settlement of disputes between employers and work-people, but the laws of Victoria and South Australia are inoperative though unrepealed. These two states and Queensland have, however, established wages boards which tend to prevent disputes on the question most frequently the cause of strikes or lock-outs. The original inspiration of the conciliation and arbitration laws arose from the great strikes of 1890 to 1892, which turned to a great extent on the attempt of labour unions to secure a monopoly of employment. They all ended in the defeat of the work-people and in a great weakening of trade unionism in the colony.

In New Zealand a law has also been in force since 1894 for the encouragement of the formation of industrial unions and associations, and to facilitate the settlement of industrial disputes. Strikes and lock-outs are now illegal in New Zealand.

AUTHORITIES.—The following are among the more important official publications on strikes and lock-outs: Reports of the Chief Labour Correspondent of the Board of Trade on Strikes and Lock-outs (annually from 1888); *Labour Gazette* (Board of Trade, monthly from May 1893); Reports of Royal Commission on Labour (1891–1894); Report of the Royal Commission on Trade Disputes and Trade Combinations (1906); Third Abstract of Foreign Labour Statistics (Board of Trade, 1906—Section on Trade Disputes), and the publication of the offices given as the authorities for the strike statistics of the various foreign countries and colonies. (See also list of authorities on TRADE UNIONS and ARBITRATION AND CONCILIATION.) (X.)

United States.

The first recourse to a strike in the United States occurred in 1740 or 1741, when a combined strike of journeymen bakers occurred in New York City. An information was filed in 1741 against the strikers for conspiracy not to bake until their wages were raised. On this they were tried and convicted, but it does not appear that any sentence was ever passed. In May 1796 an association of journeymen shoemakers in Philadelphia ordered a "turn-out" or strike to secure an increase of wages, and again in 1798, for the same purpose, both strikes being successful. In 1799 the shoemakers of Philadelphia struck against a reduction of wages, the strike lasting about ten weeks, and being only partially successful. These four are the only strikes to which any reference can be found that occurred in the United States prior to the 19th century. The conditions of industry generally during the colonial days was not conducive to strikes. The factory system had not taken deep root, masters and men worked together, and so there was no opportunity for concerted action.

Notable Early Strikes.

The first notable American strike occurred in November 1803, in the city of New York, and is commonly known as the "sailors' strike." The sailors in New York had been receiving $10 per month. They demanded an increase to $14. In carrying out their purpose they formed in a body, marched through the city, and compelled other seamen who were employed at the old rates to leave their ships and join the strike. The strikers were pursued and dispersed by the constables, who arrested their leader and lodged him in gaol, the strike thus terminating unsuccessfully. In 1805 the Journeymen Shoemakers' Association of Philadelphia again turned out for an increase of wages. The demands ranged from 25 to 75 cents per pair increase. This strike lasted six or seven weeks and was unsuccessful. The strikers were tried for conspiracy, the result of the trial being published in a pamphlet which appeared in 1806. An account of this trial may be found in the United States Supreme Court library. In November 1809 a strike among the cordwainers occurred in the city of New York. The proprietors quietly took their work to other shops, and by this stratagem defeated the strikers; but the action being discovered, a general turn-out was ordered by the Journeymen Cordwainers' Association against all the master workmen of the city, nearly 200 men being engaged in the strike. At that time a stoppage of work in one shop by the journeymen was called a "strike"; a general stoppage in all shops in a trade was known as a "general turn-out." A member of a journeymen's association who did not keep his obligations to the organization was denominated a "scab."

In 1815 some of the journeymen cordwainers of Pittsburg, Pennsylvania, were tried for conspiracy on account of their connexion with a strike, and were convicted. In 1817 a peculiar labour difficulty occurred at Medford, Massachusetts. Thacher Magoun, a ship-builder of that town, determined to abolish the grog privilege customary at that time. Mr Magoun gave notice to his people that no liquor should be used in his shipyard, and the words "No rum!" "No rum!" were written on the clapboards of the workshop and on the timbers in the yard. Some of Mr Magoun's men refused to work; but they finally surrendered, and a ship was built without the use of liquor in any form.

The period from 1821 to 1834 witnessed several strikes, but rarely more than one or two in each year. These strikes occurred among the compositors, hatters, ship carpenters and caulkers, journeymen tailors, labourers on the Chesapeake & Ohio Canal, the building trades, factory workers, shoemakers and others. One of the most notable of these, for its influence upon succeeding labour movements, occurred in 1834, in the city of Lynn, Massachusetts. During the latter part of the preceding year the female shoebinders of that town began to agitate the question of an increase of wages. The women engaged in this work usually took the materials to their homes. The manufacturers were unwilling to increase the prices paid, so a meeting for consultation was held by more than one thousand binders. This was on the 1st of January 1834. The binders resolved to take out no more work unless the increase was granted. The employers, however, steadily refused to accede to the demands, as they found no difficulty in having their work done in neighbouring towns at their own prices. The strike, after three or four weeks, came to an unsuccessful termination. In February of the same year a disturbance of short duration occurred at Lowell, Mass., among the female factory operatives. Their strike was to prevent a reduction of wages. During the year 1835 there was a large number of strikes throughout the country, instigated by both men and women. The number of strikes by dissatisfied employees had at this time become so numerous as to call forth protests from the public press, the *New York Daily Advertiser* of the 6th of June 1835 declaring that "strikes are all the fashion," and suggesting that it was "an excellent time for the journeymen to come from the country to the city."

Investigations.

The United States government, through the census office and the department (now bureau) of labour, has investigated the question of strikes, the result being a fairly continuous record from 1880 to the 31st of December 1905 inclusive. In 1880, according to the tenth census, there were 610 strikes, but the number of establishments involved in them was not reported; the record must therefore commence with 1881, and since then the facts have been continuously and uniformly reported by the department (now bureau) of labour. This record, so far as numbers are concerned, is shown in the following table:—

Year.	Strikes.			Lock-outs.	
	Number of strikes.	Establishments involved.	Employees thrown out of employment.	Establishments involved.	Employees thrown out of employment.
1881	471	2,928	129,521	9	655
1882	454	2,105	154,671	42	4,131
1883	478	2,759	149,763	117	20,512
1884	443	2,367	147,054	354	18,121
1885	645	2,284	242,705	183	15,424
1886	1,432	10,053	508,044	1509	101,980
1887	1,436	6,589	379,676	1281	59,630
1888	906	3,506	147,704	180	15,176
1889	1,075	3,786	249,559	132	10,731
1890	1,833	9,424	351,944	324	21,555
1891	1,717	8,116	298,939	546	31,014
1892	1,298	5,540	206,671	716	32,014
1893	1,305	4,555	265,914	305	21,842
1894	1,349	8,196	660,425	875	29,619
1895	1,215	6,973	392,403	370	14,785
1896	1,026	5,462	241,170	51	7,668
1897	1,078	8,492	408,391	171	7,763
1898	1,056	3,809	249,002	164	14,217
1899	1,797	11,317	417,072	323	14,817
1900	1,779	9,248	505,066	2281	62,653
1901	2,924	10,908	543,386	451	20,457
1902	3,162	14,248	659,792	1304	31,715
1903	3,494	20,248	656,055	3288	131,779
1904	2,307	10,202	517,211	2316	56,604
1905	2,077	8,292	221,686	1255	80,748
Total	36,757	181,407	8,703,824	18,547	825,610

Statistics of Strikes.—Out of the total of 181,407 establishments at which strikes took place during the period named, 69,899 were in building trades, 17,025 in coal and coke, 7381 in tobacco, 20,914 in clothing, 4450 in stone-quarrying and cutting, 1555 in boots and shoes, 1551 in furniture, 1476 in brick-making, 2999 in printing and publishing, and 1086 in cooperage. These ten industries supplied 128,336, or 70·74% of the whole number of establishments in which strikes occurred during the twenty-five years. In the lock-outs occurring during the same time five industries bore a very large proportion of the burden, involving 13,716, or 73·95% of the whole number of establishments, which was 18,547. The industries affected were: building trades, 10,142; clothing, 1943; stone-quarrying and cutting, 901; boots and shoes, 337; tobacco 393. The whole number of persons thrown out of employment by strikes was 8,703,824, of whom 90·57% were males and 9·43% were females; and the total number thrown out of employment by lock-outs during the same period was 825,610, of whom 84·18% were males and 15·82% were females. About 70% of the whole number of strikes were ordered by labour organizations; and of the number so ordered (25,353) 49·48% succeeded, 15·87% succeeded partly, and 34·65% failed. Of the whole number of strikes, 47·94% succeeded, 15·28% succeeded partly and 36·78% failed. Of the lock-outs, 50·79% succeeded, 10·71% succeeded partly and 32·09% failed. The average duration of the strikes for the whole period was 25·4 days, and of the lock-outs 84·6 days.

More strikes were occasioned by demands for increase of wages than for any other one cause, 32·24% of all strikes being for this cause, but this in combination with other causes attributable in whole or in part to demands for increase of wages brings the demands up to 40·72%.

The next most fruitful cause of strikes is disagreement concerning the recognition of the union and union rules. For this 18·84% of strikes were declared, and both alone and combined with other causes produced 32·35%. Objection to reduction of wages caused 11·90% while demands for reduction of hours alone and combined with other causes produced 9·78% of strikes.

Of the total number of establishments involved in strikes 57·91% were involved for causes either in whole or in part due to demands for increase of wages. The most important cause of lock-outs during the twenty-five years was disputes concerning the recognition of the union and union rules and employees' organizations, which alone and combined with various causes, produced nearly one-half of all lock-outs and more than one-half of all establishments involved in lock-outs. The United States government's account of losses from strikes is for the period from January 1881 to the 31st of December 1900, the five years from 1901 to 1905 inclusive not being included in that account. It is difficult to ascertain exactly the losses of employees and employers resulting from strikes and lock-outs. Differences may counterbalance each other, so that the results given below for the period named may be considered as fairly accurate.

The total loss to employees and employers alike in the establishments in which strikes and lock-outs occurred, for the period of twenty years, was thus $468,968,581. The number of establishments involved in strikes during this period was 117,509, making an average wage loss of $2194 to employees in each establishment in which strikes occurred. The number of persons thrown out of employment by reason of strikes was 6,105,694, making an average loss of $42 to each person involved. The number of establishments involved in lock-outs was 9933, making an average loss of $4915 to employees in each establishment in which lock-outs occurred, while the number of employees thrown out was 504,307, making an average loss of $97 to each person involved. Combining the figures for strikes and lock-outs, it is seen that the number of establishments involved was 127,442, while 6,610,001 persons were thrown out of employment. These figures show an average wage-loss of $2406 to the employees in each establishment, and an average loss of $46 to each person involved. The assistance given to strikers by labour organizations during the period was $16,174,793; to those involved in lock-outs, $3,451,461, or a total of $19,626,254. This sum represents but 6·40% of the total wage-loss incurred in strikes and lock-outs, and is probably too low. Much assistance was also furnished by outside sympathizers, the amount of which cannot be readily ascertained. The total loss to the establishments or firms involved in strikes and lock-outs during this period was $142,659,104.

Year.	Strikes.			Lock-outs.		
	To date when Strikers were re-employed or employed elsewhere.		Loss of Employers.	To date when Employees locked out were re-employed or employed elsewhere.		Loss of Employers.
	Wage-loss of Employees.	Assistance to Employees by Labour Organizations.		Wage-loss of Employees.	Assistance to Employees by Labour Organizations.	
	$	$	$	$	$	$
1881	3,372,578	287,999	1,919,483	18,519	3,150	6,960

1900	18,341,570	1,434,452	9,431,299	16,136,802	448,219	5,447,930
Total	257,863,478	16,174,793	122,731,121	48,819,745	3,451,461	19,927,983

The states of Illinois, Massachusetts, New York, Ohio and Pennsylvania, being the leading manufacturing states, necessarily experienced the largest number of strikes. Out of 117,509 establishments having strikes during the period named, 87,878, or 74·78% of the whole, were in these five states; and out of 9933 establishments having lock-outs, 8424, or 84·81% were in these states. In 1900 these states contained 45·02% of all the manufacturing establishments in the United States, and employed 55·15% of the entire capital invested in mechanical industries.

A significant feature of the report for the twenty-five year period relates to efforts to settle strikes, during the years 1901 to 1905 inclusive, a feature which had not been embodied before. The results are shown in the following table:—

Year.	Strikes. Number.	Strikes. Number settled by joint agreement.	Strikes. Number settled by arbitration.	Lock-outs. Number.	Lock-outs. Number settled by joint agreement.	Lock-outs. Number settled by arbitration.
1901	2,924	149	49	88	10	2
1902	3,162	204	58	78	11	1
1903	3,494	246	66	154	18	3
1904	2,307	130	23	112	17	2
1905	2,077	74	27	109	10	3
Total	13,964	803	223	541	66	11

The figures given relate to all strikes, of whatever magnitude, occurring in the United States from 1881 to the 31st of December 1900 inclusive.

Historic Strikes.

Among them have occurred what may be called historic strikes, the first of which was in 1877, though of course many very severe strikes had taken place prior to that year. The great railway strikes of 1877 began on the Baltimore & Ohio Railroad at Martinsburg, West Virginia, the immediate cause of the first strike being a 10% reduction of wages of all employees. This, however, was but one of many grievances. There was irregular employment. Men with families were permitted to work only three or four days per week, the remainder of the time being forced to spend away from home at their own expense, leaving them but little money for domestic use. Wages, payable monthly, were often retained several months. The tonnage of trains was increased, and the men were paid only for the number of miles run, irrespective of the time consumed. So there were many alleged causes for the great strikes of 1877. Riot, destruction of property and loss of life occurred at Martinsburg, Baltimore and various places in Pennsylvania. The state militia at Martinsburg and Pittsburg sympathized with the strikers, affiliated with them and refused to fire upon them. United States troops were ordered from Eastern garrisons, and they dispersed the mobs. In Cincinnati, Toledo and St Louis mobs of roughs and tramps collected, and succeeded in closing most of the shops, factories and rolling-mills in those cities. There were also formidable demonstrations in Chicago, as well as in Syracuse, Buffalo, West Albany and Hornell, New York, where mobs were dispersed by the state militia without violence or destruction of property.

The Pennsylvania Railroad also had a memorable strike, accompanied by riots and much violence and destruction of property, during the same year, the strike being ordered on account of a general reduction in wages and some other causes which came in to create the difficulty. The complete story of this strike is too long to relate here, but from the beginning the strikers had the active sympathy of a large proportion of the people of Pittsburg, where the chief movements occurred. The actual loss to the Pennsylvania Company, not including freight, has been estimated at $2,000,000, while the loss of property and loss of business at Pittsburg amounted to $5,000,000. Claims were presented before the courts in Allegheny county to the amount of over $3,500,000, while the actual amount paid by compromise and judgments was over $2,750,000. Both the foregoing strikes were unsuccessful.

The next great strike was that of the telegraphists, which occurred in the year 1883. This strike was inaugurated to secure the abolition of Sunday work without extra pay, the reduction of day-turns to eight hours, and the equalization of pay between the sexes for the same kind of work. Universal increase of wages was also demanded. The strike commenced on the 19th of July and ended on the 23rd of August 1883, although it was declared off on the 17th of the latter month. It was unsuccessful, the employees losing $250,000 and expending $62,000 in assistance to destitute fellow operators. The employers lost nearly $1,000,000.

Another historic strike, only partially successful, was that on the South-Western or Gould system of railways in the years 1885–1886, but the most prominent labour controversies in the 19th century were those at Homestead, Pa., in July 1892, and at Chicago in 1894, concerning which a more detailed account is given below. Other great labour convulsions have occurred which help to identify the decade beginning 1890 with the great strike era of the century. Among them may be named the Lehigh Valley railroad strike in December 1893, the American Railway Union strike on the Great Northern railway in April 1894; the great coal strike, which occurred in the same month; the difficulties at Lattimer, Pa.; and those in the Coeur d'Alene district of Idaho.

Homestead Strike or Riot.

In July 1892 there occurred a most serious affair between the Carnegie Steel Company and its employees at what is known as the Homestead Works, near Pittsburg, growing out of a disagreement in the previous month in regard to wages. The parties were unable to come to an agreement, and the company closed its works on the 30th of June and discharged its men. Only a small portion of the men were affected by the proposed adjustment of wages. The larger portion of them, who were members of the Amalgamated Association of Iron and Steel Workers, were not affected at all, nor was the large force of employees, some three thousand in number, who were not members of that association. The company refused to recognize the association as an organization, or to hold any conference with its representatives. Upon the failure to arrive at an adjustment of the wage difficulty the company proposed to operate its works by the employment of non-union men. The men, who could not secure recognition, refused to accept the reduced rates of wages, and also came to the determination that they would resist the company in every attempt to secure non-union workers.

The history of the events at Homestead shows that the lodges composing the Amalgamated Association proceeded to organize what was styled an "advisory committee" to take charge of affairs for the strikers. All employees of the company were directed to break their contracts and to refuse to work until the Amalgamated Association was recognized and its terms agreed to. The works were shut down two days prior to the time provided by the contract under which the men were working, and, as alleged, because the workmen had seen fit to hang the president of the company in effigy. On the 4th of July the officers of the company asked the sheriff of the county to appoint deputies to protect the works while they carried out their intention of making repairs. The employees, on their part organized themselves to defend the works against what they called encroachments or demands to enter; in fact, they took possession of the Homestead Steel Works. When the sheriff's men approached, the workmen, who were assembled in force, notified them to leave the place, as they did not intend to create any disorder, and would not allow any damage to be done to the property of the company. They further offered to act as deputies, an offer which was declined. The advisory committee, which had been able to preserve the peace thus far, dissolved on the rejection of their offer to serve as deputies and conservators of the peace, and all of their records were destroyed. The immediate cause of the fighting which subsequently took place at Homestead was the approach of a body of Pinkerton's detectives, who were gathered in two barges on the Ohio river, some miles below the works. When the Pinkertons arrived the workmen broke through the mill fence, entrenching themselves behind the steel billets, and made all preparations to resist the approach of the Pinkerton barges; and they resisted all attempts to land, the result being a fierce battle, brought on by a heavy volley of shots from the strikers. The Pinkertons were armed with Winchesters, but they were obliged to land and ascend the embankment single file, and so were soon driven back to the boats, suffering severely from the fire of the strikers. Many efforts were made to land, but the position of the men they were attacking, behind their breastworks of steel rails and billets, was very strong, and from this place of safe refuge the detectives were subjected to a galling fire. This opening battle took place on the 5th of July, about four o'clock in the morning, and was continued in a desultory way during the day. It was renewed the following day. A brass ten-pound cannon had been secured by the strikers, and planted so as to command the barges moored at the banks of the river. Another force of one thousand men had taken up a position on the opposite side of the river, where they protected themselves and a cannon which they had obtained by a breastwork of railway ties. A little before nine o'clock a bombardment commenced, the cannon being turned on the boats, and the firing was kept up for several hours. The boats were protected by heavy steel plates inside, so efforts were made to fire them. Hose was procured and oil sprayed on the decks and sides, and at the same time many barrels of oil were emptied into the river above the mooring place, the purpose being to ignite it and then allow it to float against the boats. Under these combined movements the Pinkertons were obliged to throw out a flag of truce, but it was not recognized by the strikers. The officers of the Amalgamated Association, however, interfered, and a surrender of the detectives was arranged. It was agreed that they should be safely guarded, under condition that they left their arms and ammunition; and, having no alternative, they accepted the terms. Seven had been killed and twenty or thirty wounded. On the 10th of July, after several days' correspondence with the state authorities, the governor sent the entire force of the militia of the state to Homestead. On the 12th the troops arrived, the town was placed under martial law, and order was restored. There had been much looting, clubbing and stoning, and as the detectives, after surrender, passed through the streets they were treated with great abuse. Eleven workmen and spectators were killed in the fights.

Congress made an investigation of this strike, but no legislative action was ever taken. Some indictments were made and lawsuits ensued. The mills were gradually supplied with new people, but the strike was not declared off until the 20th of November 1892. The Homestead strike must be considered as the bitterest labour war in the United States prior to the Chicago strike in 1894. It was unsuccessful.

The Chicago or Pullman Strike.

Probably the most expensive and far-reaching labour controversy which can properly be classed among the historic controversies of this generation was the Chicago strike of June and July 1894. Beginning with a private strike at the works of Pullman's Palace Car Company at Pullman, a suburb of Chicago, it ended with a practical insurrection of the labour employed on the principal railways radiating from Chicago and some of their affiliated lines, paralysing internal commerce, putting the public to great inconvenience, delaying the mails, and in general demoralizing business. Its influences were felt all over the country, to greater or less extent, according to the lines of traffic and the courses of trade. The contest was not limited to the parties with whom it originated, for soon there were brought into it two other factors or forces. The original strike grew out of a demand of certain employees of the Pullman Company in May 1894 for a restoration of the wages paid during the previous year. The company claimed that the reduction in the volume of business, owing to business depression, did not warrant the payment of the old wages. On account of the increased production of rolling-stock to meet the traffic incident to the World's Fair in 1893, orders for building cars were not easily obtainable, a large portion of the business of the Pullman Company being contract business in the way of building cars for railway companies generally. This state of affairs resulted in a partial cessation of car-building everywhere in the country, the Pullman Company suffering with all others. The demand of the employees therefore was not acceded to, and on the 11th of May 1894 a strike was ordered. Several minor grievances were claimed to have existed and to have led to the action of the strikers, who had joined the American Railway Union, an association of railway employees which had achieved a partial success in a contest with the Great Northern Railway a few weeks previous to the Pullman strike. The Railway Union espoused the cause of the Pullman employees on the ground that they were members thereof. This union was said to number about 150,000 members. It undertook to force the Pullman Company to accede to the demands of its employees by boycotting Pullman cars; that is to say, they declared that they would not handle Pullman cars on the railways unless the Pullman Company would accede to the demands made upon it. The immediate antagonist of the Pullman Company in the extended controversy was therefore the American Railway Union.

Another force was soon involved in the strike, which was, very naturally, an ally of the Pullman Company. This was the General Managers' Association, a body of railway men representing all the roads, twenty-four in number, radiating from Chicago, and it was said to be the necessity of protecting the traffic of its lines that brought about its struggle with the American Railway Union. These roads represented a combined capital of more than $2,000,000,000, and they employed more than one-fourth of all the railway employees in the United States. These three great forces, therefore, were engaged in a battle for supremacy, and that rivalry alone, without reference to the conditions and circumstances attending the strike or accompanying it, makes this one of the historic strikes of the period.

According to the testimony of the officials of the railways involved, they lost in property destroyed, hire of United States deputy marshals and other incidental expenses, at least $685,308. The loss of earnings of these roads on account of the strike is estimated at nearly $5,000,000. About 3100 employees at Pullman lost in wages, as estimated, probably $350,000. About 100,000 employees upon the twenty-four railways radiating from Chicago, all of which were more or less involved in the strike, lost in wages, as estimated, nearly $1,400,000. Beyond these amounts very great losses, widely distributed, were suffered incidentally throughout the country. The suspension of transportation at Chicago paralysed a vast distributive centre, and imposed many hardships and much loss upon the great number of people whose manufacturing and business operations, employment, travel and necessary supplies depend upon and demand regular transportation to, from and through Chicago. The losses to the country at large are estimated by Bradstreets to be in the vicinity of $80,000,000. Whatever they are, whether more or less, they teach the necessity of preventing such disasters, and the strike illustrates how a small local disturbance, arising from the complaints of a few people, can affect a whole country. When the American Railway Union took up the cudgels for the Pullman strikers and declared their boycott against Pullman cars, and the General Managers' Association took every means to protect their interests and prevent the stoppage of transportation, the sympathies and antagonisms of the whole country were aroused. An unsuccessful attempt was made to induce all trades in Chicago to join in a great sympathetic strike.

The inevitable accompaniments of a great strike were brought into play at Chicago. Riots, intimidations, assaults, murder, arson and burglary, with lesser crimes, attended the strike. In this, as in some of the other historic strikes, troops were engaged. The city police, the county sheriffs, the state militia, United States deputy marshals and regulars from the United States army were all brought into the controversy. The United States troops were sent to Chicago to protect Federal property and to prevent obstruction in the carrying of the mails, to prevent interference with inter-state commerce, and to enforce the decrees and mandates of the Federal courts. They took no part in any attempt to suppress the strike, nor could they, as such matters belong to the city and state authorities. The police of the city were used to suppress riots and protect the property of citizens, and the state militia was called in for the same service. The total of these forces employed during the strike was 14,186.

Many indictments and law-suits originated in the difficulties occurring in Chicago. But all the attending circumstances of the strike point to one conclusion—that a share of the responsibility for bringing it on belongs in some degree to each and every party involved. The strike generated a vast deal of bitter feeling—so bitter that neither party was ready to consider the rights of the other. The attacking parties claimed that their grievances warranted them in adopting any means in their power to force concessions. This is the attitude of all strikers. The other parties, on the other hand, claimed that they were justified in adopting any means in their power to resist the demands of the attacking party. The probability is that neither recognized the rights of the public to such an extent as to induce them to forbear bringing inconvenience and disturbance to it. It was the most suggestive strike that has ever occurred in the United States, and if it only proves a lesson sufficiently severe to teach the public its rights in such matters, and to teach it to adopt measures to preserve these rights, it will be worth all it cost. It was unsuccessful, and resulted ultimately in the downfall of the American Railway Union.

The Steel Strike, 1901.

The so-called steel strike of the year 1901 was a contest between the Amalgamated Association of Iron, Steel and Tin Workers and the United States Steel Corporation. It began on the first day of July, and lasted until the 15th of September 1901, when work was resumed in accordance with an adjustment agreed to on the 13th of the latter month. The difficulty grew out of an attempt to adjust a sliding scale of wages with some of the constituent companies of the United States Steel Corporation, a new company having $1,404,000,000 capitalization. This corporation was perfected after the difficulties really began, so the Amalgamated Association ultimately had to confront the new powerful corporation. The real nut of the difficulty was not a question of wages, hours of labour, or rules or conditions of work, but a contest for recognition of the right of the association to demand the unionizing of mills, a demand, of course, which was positively refused by the United States Steel Corporation. There were no grievances, as intimated; it was clearly and solely a conflict on the demand for recognition in the trade-union sense, and it was the first great struggle in the United States that was conducted solely on this issue. This issue has been contested many times, but usually in conjunction with some grievance or complicated with some demand as to wages or other economic conditions. The result was that the Amalgamated Association did not secure the terms demanded; and it lost further, because some of the mills which were subject to the union's rules were taken out and made non-union mills. The strike was conducted without any of the dramatic and tragic circumstances which attended the Homestead affair in 1892, in which the Amalgamated Association was one of the parties. In the contest of 1901 the association did not have the hearty endorsement of a large number of workmen, as it was not a movement to redress any grievance. It was fought for a principle, but the movers did not consider the power against which they were obliged to contend. Officers of the Amalgamated Association estimated that the number of men out of employment during the strike averaged 30,000 per day. At a conservative estimate there must have been a loss of more than $4,000,000 in wages. The steel company through its officers claimed that it experienced no great loss as the result of the strike.

Coal Strike, 1902.

A strike affecting more individual interests than any preceding it was the anthracite coal strike of 1902, which formally began on the 12th of May. It was ordered at a convention held at Hazleton, Pa., on the 15th of May, by a vote of 461 to 349. The leaders of the miners, with one or two exceptions, opposed the strike. It was therefore a strike of the workers themselves. Grievances had existed in the anthracite coal region for many years, but more especially since the strike of 1900. An attempt was made in 1901 to secure some concessions, but the operating railways declined even to enter into a conference. This, of course, caused irritation, and constant appeals were made to the officers of the union to make new demands, and failing to secure concessions, to organize a strike. The demands of the miners were as follows: (1) An increase of 20% to those miners who are paid by the ton; (2) a reduction of 20% in the time of per diem employees; (3) that 2240 ℔ constitute the ton on which payment is made for coal mined by weight. No grievances were presented. The powder question was practically settled in 1900. The miners' demands being rejected by the operators, the demands were subsequently reduced one-half; *i.e.* 10% increase per ton where mining is paid by the ton, and 10% decrease in the working day. The miners also voted to leave the whole matter to arbitration and investigation, and to accept the results. They were willing to make a three years' contract on the terms proposed. The fundamental difficulty on the part of the operators related to efforts to secure and preserve discipline. They claimed that every concession already made had defeated this. The strike involved nearly 150,000 employees, and affected the consumers of anthracite coal throughout the eastern states.

After the most strenuous efforts of both parties to this strike, the president of the United States, at the request of the great coal operators and the officers of the Miners' Union, appointed a commission to adjust their differences, and after five months of hearings, listening to nearly six hundred witnesses, the commission submitted an award which was to be in effect three years from the 1st of April 1903. Both parties had agreed to abide by the award, whatever it might be. After the three years had expired, that is, the 31st of March 1906, the miners concluded to strike again, but after some negotiations both parties again unanimously agreed to extend the award made by the commission for three years more, *i.e.* until the 31st of March 1909.

After the coal strike of 1902 many very important disturbances occurred. There was one among the silver miners at Cripple Creek, Colorado, 1894, at Leadville, 1896–1897, at Lake City, 1899, and at Telluride in 1901; also another at Colorado City in 1903. All these strikes were attended with a great deal of violence, the militia was ordered out, many murders took place, and in three counties of Colorado there was a reign of terror, but on the whole the strikes were unsuccessful. The Western Federation of Miners was seriously crippled in these affairs.

It is gratifying to note the reduction in the number of strikes as shown by recent statistics. In 1903 the number of establishments was 20,248, but it had dropped to 8292 in 1905.

STRINDBERG, AUGUST (1849–), Swedish author, was born at Stockholm on the 22nd of January 1849. He entered the university of Upsala in 1867, but was compelled by poverty to interrupt his studies, which were resumed in 1870. His gloomy experiences of student life are reflected in a series of sketches named after two districts of Upsala, *Från Fjerdingen och Svartbäcken* (1877), which aroused great indignation at the time. After various experiments as schoolmaster, private tutor and actor, he turned to journalism, and afterwards more than avenged himself for the triviality and narrowness of his new surroundings in his famous *Röda rummet* ("The Red Room," 1879), described in the sub-title as sketches of literary and artistic life. The "red room" was the meeting-place in a small café in Stockholm of a society of needy journalists and artists, whose failure and despair are shown off against the prosperity of a typical bourgeois couple. In these stories Strindberg's fanatic hatred of womankind already makes its appearance, the disasters of the principal figures being precipitated by the selfishness and immorality of the women. In 1874 some friends procured him a place in the Royal library at Stockholm where he was employed until 1882. He was already an ardent student of physical science; he now gave proof of his versatility by learning Chinese in order to catalogue the Chinese MSS. in the library; and his French monograph on the early relations of Sweden with the Far East was read in 1879 before the Academy of Inscriptions in Paris. He continued to write for the newspapers and for the theatre. His first important drama, *Mäster Olof*, which had been refused in 1872 by the theatrical authorities, was produced after repeated revision in 1878. Although real historical personages—Gustavus Vasa, Olaus Petri the reformer and Gerdt the Anabaptist—figure as leading characters, they are made symbolic of the present-day forces of progress and reaction. The production of *Mäster Olof* marked the beginning of the new movement in Swedish literature, and the *Red Room* and the collection of satirical sketches entitled *Det nya riket* ("The New Kingdom," 1882) increased the growing hostility to Strindberg. Two comedies drawn from medieval subjects, *Gillets hemlighet* ("The Secret of the Guild," 1880) and *herr Bengt's Hustru* ("Bengt's Wife," 1882), were followed by the legendary drama of *Lycko Pers resa* ("The Journal of Lucky Peter"), written in 1882 and produced with great success on the stage a year later.

In 1883 Strindberg left Sweden with his family, to travel in Germany, Italy, France and Denmark, writing for foreign reviews and producing various volumes of stories and articles. Meanwhile he had been developing his attack on the feminist movement, which had received a great stimulus in Scandinavia from the dramas of Ibsen. In *Giftas* ("Married," 1884) he produced twelve stories of married life to support his view of the sex question; this was followed in 1886 by a second collection with the same title, which was written in a more violent tone and lacked some of the art of the earlier attack. He was prosecuted for assailing the dogma of the communion, but he returned to Sweden to defend himself, and was acquitted. Strindberg's mastery of the art of description is perhaps seen at its best in the novels of life in the Swedish archipelago, in *Hemsöborna* ("The Inhabitants of Hemsö, 1887), one of the best existing novels of popular Swedish life, and *Skärkarlslif* ("Life of an Island Lad," 1890). *Tschaudala* (1889) and *I hafsbandet* ("In the Bond of the Sea," 1890) show the influence of a study of Nietzsche. In 1887 he returned to drama with the powerful tragedy *Fadren*, produced in Paris also as *Le père*; this was followed in 1888 by *Fröken Julie*, described as a naturalistic drama, to which he wrote a preface in the nature of a manifesto, directed against critics who had resented the gloom of *Fadren*. *Kamraterna* ("Comrades," 1888), which belongs to the same group of six plays, was followed by *Himmelrikets-nycklar* ("The Keys of the Kingdom of Heaven," 1892), a legendary drama, and by the historical dramas of *Erik XIV*. (1899), *Gustav Adolf* (1900), and *Gustav Vasa* (1899); *Till Damascus* (1898) indicated a return in the direction of religion; *Folkungasagan* (1899) was represented in 1901; and the two plays *Avent* ("Advent") and *Brott och brott* ("Crime for Crime"), printed together in 1899, were successfully represented in 1900, both in Sweden and Germany.

Strindberg has provided a quantity of what is really autobiographical material, with an account of the origin of his various books, in the form of a novel, *Tjensteqvinnans son* ("The Son of a Servant," 1886–1887), with the sub-title of "A Soul's Development." The revelations of this book explain much of the bitterness of his work, and it was followed in 1893 by a fourth part in German, *Die Beichte eines Thoren* ("A Fool's Confession"), the printing of which was forbidden in Sweden. With these should be classed his *Inferno* (1897) and *Sömngångarnätter* ("The Nights of a Somnambulist," 1900). Strindberg's first marriage was an unfortunate one, and was dissolved in 1893. He then married an Austrian lady, from whom he was separated in 1896. In 1901 he married the Swedish actress Harriet Bosse, from whom he was amicably separated soon afterwards. He suffered at different times from mental attacks, of which he gave analytic accounts on his recovery.

A number of criticisms on Strindberg from eminent hands are collected in *En bok om Strindberg* (Karlstad, 1894).

STRING, a general term for thin cord, or stout thread, a line or cord on which objects are strung. The O. Eng. word is *streng*, cf. Dan. *streng*, Ger. *Strang*, and meant that which is strongly or tightly twisted; it is related to "strong," and is to be referred to the root seen also in Lat. *stringere*, to draw tight, whence "stringent" and "strict," and in Gr. στραγγάλη, a halter, whence comes "strangle," to choke, throttle. The word is particularly used of the cord of a bow, and of the stretched cords of gut and wire upon a musical instrument, the vibration of which produces the tones (see STRINGED INSTRUMENTS below). In architecture the term "string-course" is applied to the projecting course or moulding running horizontally along the face of a building.

STRINGED INSTRUMENTS (Fr. *instruments à cordes*; Ger. *Saiteninstrumente*; Ital. *strumenti a corde*), a large and important section of musical instruments comprising subdivisions classed (*A*) according to the method in which the strings are set in vibration (*B*) according to certain structural characteristics of the instruments themselves.

Section A.—This includes instruments with strings (1) plucked by fingers or plectrum; (2) struck by hammers or tangents; set in vibration (3) by friction of the bow, (4) by friction of a wheel or (5) by the wind. In all these classes we are also concerned with the manner in which the strings are stretched in order to ensure resonance, and with the measures taken to obtain more than one sound from each string.

1. *Strings plucked by Fingers or Plectrum*.—Twanging the strings by the fingers is the most primitive method, probably suggested by the feeble note given out by the tense string of the hunters' bow, which was the prototype of the harp. In this ancient instrument, popular in all ages and lands, the strings are stretched *à vide* between two supports of a frame, the lower of which acts as a soundboard from which the strings rise perpendicularly. The scale of all harp-like instruments is produced by means of one string for each note, difference in pitch being obtained by varying the length of the strings. In the modern pedal harp with double action the strings can be shortened sufficiently to raise the pitch a semitone or a tone by means of an ingenious system of levers set in motion by the pedals, which cause disks, each furnished with two studs, to turn and grasp the string, thus shortening the vibrating length. This device may be regarded as an infringement of the principle of the harp, whereas in the chromatic harp (Pleyel Wolff & Co.) the same object has been obtained without violating the principle by ingeniously increasing the number of strings. The *nanga* of the ancient Egyptians, of which specimens are preserved in the British Museum, an instrument having a boat-shaped body with a long curved neck from which the strings stretch at right angles to the soundboard, is the only link as yet discovered between the bow and the harp. The next step observed is the device of stretching the strings partly over a soundboard and partly *à vide*, as in the cithara, the lyre, the rotta, the crwth, &c.

The strings lying parallel with the soundboard are slightly raised over a bridge, by means of which the vibrations are communicated to the belly of the instrument. Between the soundboard and the cross-bar, upheld by two arms springing from the body of the instrument, the strings at first bridged an open space for greater convenience in twanging them with both hands. The gradual closing up of this open space marks the various steps in the transition from cithara to fiddle. In the Egyptian cithara the harp-like arrangement of the strings was maintained by making the cross-bar oblique. In the Assyrian and later in the Greek and Roman citharas and lyres all the strings were of the same length, difference in pitch being secured by varying the thickness of the strings.

A later development consisted in discarding the open space altogether, whereby the third method of stretching the strings was evolved. In these new instruments the strings lay over the sound-chest, raised on bridges which determined their vibrating length according to the method of stringing the harp or the cithara. As examples of this type may be cited the psalterion or psaltery and in the middle ages the zither.

The addition of a keyboard to the psaltery, as a means of increasing its scope, created a new class of instruments of which the principal members were the clavicymbalum, the virginal, spinet and the harpsichord. In these the principle of plucking the strings by means of a plectrum or quill was preserved, but the quill was fixed in the pivoted tongue of a piece of wood, known as a "jack," which rested on the end of a balanced key. The jack worked easy through a rectangular hole in the soundboard, and when the key was pressed down the jack was thrown up, the quill catching the string and plucking it. The string thus plucked vibrated over the whole length from hitch-pin to belly-bridge (cf. the effect of the tangent in the clavichord).

When the principle of stopping strings by pressing them against a fingerboard in order to obtain several sounds from each had been discovered and applied by adding a neck to the body, a new subdivision was created in this class of instruments. The exact division of the strings necessary to produce the required intervals was measured off and indicated by ligatures of hide or gut (called frets), bound round the neck, against which the strings were pressed by the fingers. This principle involved a very great advance in technique, and produced the two great families of guitar and lute. During the middle ages, the bass lute (theorbo or barbiton) and the double-bass lutes (archlute and chitarrone) had, in addition to the strings stretched over the finger-board, for which the pegs were placed half-way up the neck, a complement of bass strings stretched *à vide* from the bridge tail-piece to the end of the neck, where a second peg-box was provided. In the chitarrone these bass strings, each of which produced but one note, were about 5 ft. long; the archlute of similar construction was in size between the former and the theorbo.

The plectrum was used to pluck the strings in classic Greece and Rome, in order to provide an additional effect of brilliancy for joyous or martial themes. If the music gained in brilliancy, the instrument lost the power of expressing the performer's emotions. During the middle ages the use of wire and spun strings in some instruments, such as the mandola, rendered the use of the plectrum a necessity.

2. *Strings struck by Hammers or Tangents.*—The earliest known instrument thus played was the Assyrian dulcimer, or *pisantir*, represented on some of the stone slabs brought by Sir A. H. Layard from the mound of Kuyunjik, and preserved at the British Museum among scenes from the history of Sardanapalus; it is the instrument erroneously rendered *psaltery* in Dan. iii. 5, while the instrument rendered dulcimer in the Authorized Version of the Bible should be bagpipe.

In the dulcimer the strings, as in the psaltery, were stretched over a rectangular or trapezoid sound-chest, the vibrating length being determined by means of two bridges. The strings were struck by means of two curved sticks, or by hammers, with an elastic wrist action, which produced clear, bell-like tones. The dulcimer has survived in the *cembalo* or *cimbalom* of the Hungarian gipsies. The application of the keyboard to the dulcimer produced the clavichord and later the pianoforte. In the earliest clavichords, known as fretted (Ger. *gebunden*), one string was made to do duty for several notes. The tangent or upright blade of brass tapering towards the bottom, where it was fastened into the end of the key, replaced the hammer of the dulcimer, for which it was hardly a substitute for the following reason. The function of the tangent constitutes the main technical innovation; instead of giving a sharp blow and rebounding instantly from the string, like the hammer on the strings of the dulcimer, the tangent remained on the string as long as the key was pressed down, and as it rose cloth dampers stopped the vibration. It is usual to compare the tangent of the clavichord to the hammer of the dulcimer, but the action of the tangent more nearly resembles the pressure of the finger on the string of the violin. Just as the finger determines the vibrating length of the violin string from the bridge, so the tangent sets the string vibrating from the point of impact to the belly-bridge. By twisting the key levers, the tangents belonging to three or four different keys were brought to bear on the same string or group of unisons at different points, all the strings being of the same length. It was not until the 18th century that fret-free or *bund-frei* clavichords were invented; they had throughout the compass a key and a tangent to each pair of unisons. The action of the hammer of the dulcimer reappeared in the pianoforte. Owing to the peculiar action of the tangent it was possible to produce on the clavichord the *vibrato* effect (*Bebung*) as in the violin, an effect which is impracticable on any other keyboard instrument.

3. *Strings set in Vibration by Friction of the Bow.*—Although used with various other instruments, such as the Oriental rebab and its European successor the rebec, with the oval vielle, the guitar- or troubadour-fiddle and the viols, it is with the effect of the bow on the perfected type represented by the violin family that we are mostly concerned. The strings in this case are all of the same length, difference in pitch being secured by thickness and tension. The fingers, by pressing the strings, produce a variety of notes from each string at will by shortening the vibrating section as the position of the fingers shift in the direction of the bridge. The friction of the bow on the string induces a twofold vibration, the actual longitudinal vibration of the string and the molecular, both of which are transmitted by the bridge to the soundboard, whereby they become intensified or reinforced. To this class belong also the Welsh crwth and the tromba marina.

4. *Strings set in Vibration by Friction of a Wheel.*—This class is small, being represented mainly by the organistrum and the hurdy-gurdy and a few sostenente keyboard instruments. In these instruments the rosined wheel performs mechanically the function of the bow, setting the strings in vibration as it revolves. A row of ten or twelve keys controlling wooden tangents performs the function of the fingers in stopping the strings. Two or more strings outside the range of the tangents always sound the same drone bass, the fingers playing the melody on the treble strings.

5. *Strings set in Vibration by the Wind.*—An example is the aeolian harp. Here the eight strings of different thickness, but tuned strictly in unison and left slack, are set in vibration by a current of air passing obliquely across them, causing the strings to divide into aliquot parts, thus producing various harmonics.

Section B.—There are, besides, certain structural features in the instruments independent of the strings, which influence the quality of tone to a greater or lesser degree. First, the construction of the sound-chest, the box form consisting of back and belly or soundboard, joined by ribs of equal width, giving the best results in classes 1 and 3. The sound-chest, consisting of a vaulted back to which is glued a flat soundboard, gives very poor results in class 3, but is eminently suitable for class 1. The position and shape of the sound-holes on each side of the strings for bowed instruments, and in the centre for those of which the strings are plucked, are not without influence on the tone. (K. S.)

STRIP, to remove or tear off the outer covering of anything, hence to rob or plunder; also a narrow long piece of stuff or material, or a mark or division narrow in proportion to its length distinguished from its ground or surroundings by colour or other variation of texture, character, &c.; a stripe; this last word is a variant of "strip," a particular meaning, that of a stroke or lash of a whip, is either due to the original meaning of "strip," to flay, or to the long narrow mark or wheal left by a blow. The O. Eng. *strypan*, to strip, is cognate with Du. *stroopen*, Ger. *streifen*, and the root is possibly seen in "strike," Lat. *stringere*. "To strip" has many technical meanings, *e.g.* to separate the tobacco leaf from the stems, to remove the overlying soil from a mineral deposit before opening and working it, to turn a gun-barrel in a lathe, &c. In architecture, a "strip-pilaster" is a narrow pilaster such as is found in Saxon work and in the Italian Romanesque churches. "Stripling," a youth, is apparently a diminutive of "strip," in the sense of a young growing lad.

STRODE, RALPH (*fl.* 1350–1400), English schoolman, was probably a native of the West Midlands. He was a fellow of Merton College, Oxford, before 1360, and famous as a teacher of logic and philosophy and a writer on educational subjects. He belonged, like Thomas Aquinas and Bonaventura, to that "School of the Middle" which mediated between realists and nominalists. Besides his *Logica*, which has not survived, he wrote *Consequentiae*, a treatise on the syllogism, and *Obligationes* or *Scholastica militia*, a series of "formal exercises in scholastic dialectics." He had some not unfriendly controversy with his colleague John Wyclif, against whom he defended the possession of wealth by the clergy, and held that in the Church abuses were better than disturbance. He also attacked Wyclif's doctrine of predestination. His positions are gathered from Wyclif's *Responsiones ad Rodolphum Strodum* (MS. 3926, Vienna Imperial Library). Strode is also associated with John Gower in Chaucer's dedication of *Troylus and Cryseyde*, and Strode himself, according to the 15th-century *Vetus catalogus* of fellows of Merton, was a "poeta nobilis." Leland and Bale confirm this testimony, and Professor I. Gollancz has suggested the identification of the *Phantasma Radulphi* attributed to Strode in the *Vetus catalogus* with the beautiful 14th-century elegiac poem *The Pearl*. If this hold good, Strode wrote also *Cleanness*, *Patience*, and *Sir Gawayne and the Green Knight*. From 1375 to 1385 this Strode or another of the same name was common sergeant of the city of London; he died in 1387.

See Prantl, *Geschichte der Logik*; for an attempt to distinguish between Strode the schoolman and Strode the poet, see J. T. T. Brown, in *The Scottish Antiquary* (1897), vol. xii.

STRODE, WILLIAM (1598–1645), English parliamentarian, second son of Sir William Strode, of Newnham, Devonshire (a member of an ancient family long established in that county, which became extinct in 1897), and of Mary, daughter of Thomas Southcote of Bovey Tracey in Devonshire, was born in 1598. He was admitted as a student of the Inner Temple in 1614, matriculated at Exeter College, Oxford, in 1617, and took the degree of B.A. in 1619. He was returned to parliament in 1624 for Beeralston, and represented the borough in all succeeding parliaments till his death. He from the first threw himself into opposition to Charles I. and took a leading part in the disorderly scene of the 2nd of March 1629, when the speaker, Sir John Finch, refusing to put the resolution of Sir J. Eliot against arbitrary taxation and innovations in religion, was held down in the chair (see HOLLES, DENZIL). Prosecuted before the star chamber, he refused "to answer anything done in the House of Parliament but in that House." On the 7th of May a fresh warrant was issued, and a month later, to prevent his release on bail, he was sent by Charles with two of his fellow members to the Tower. Refusing to give a bond for his good behaviour, he was sentenced to imprisonment during the king's pleasure, and was kept in confinement in various prisons for eleven years. In January 1640, in accordance with the king's new policy of moderation, he was liberated; and on the 13th of April took his seat in the Short Parliament, with a mind embittered by the sense of his wrongs. In the Long Parliament, which met on the 3rd of November 1640, he was the first to propose the control by parliament over ministerial appointments, the militia, and its own duration; supported the Grand Remonstrance of the 7th of November 1641; and displayed a violent zeal in pursuing the prosecution of Strafford, actually proposing that all who appeared as the prisoner's counsel should be "charged as conspirators in the same treason." As a result he was included among the five members impeached by Charles of high treason on the 3rd of January 1642. (See PYM, JOHN; ELIOT, SIR JOHN; HAMPDEN, JOHN; HESIBRIGE, SIR ARTHUR; and CHARLES I.). He opposed all suggestions of compromise with Charles, urged on the preparations for war, and on the 23rd of October was present at the battle of Edgehill. In the prosecution of Laud he showed the same relentless zeal as he had in that of Strafford, and it was he who, on the 28th of November 1644, carried up the message from the Commons to the Lords, desiring them to hasten on the ordinance for the archbishop's execution. Strode did not long survive his victim. He is mentioned as having been elected a member of the assembly of divines on the 31st of January 1645. He died on the 9th of September of the same year, and by order of parliament was accorded a public funeral in Westminster Abbey. The body was exhumed after the Restoration. Strode was a man of strong character, but of narrow, though clear and decided judgment, both his good and his bad qualities being exaggerated by the wrongs he had suffered. Clarendon speaks of him as a man "of low account and esteem," who only gained his reputation by his accidental association with those greater than himself; but to his own party his "insuperable constancie" gave him a title to rank with those who had, at a time when the liberties of England hung in the balance, deserved best of their country.

The identity of the W. Strode imprisoned in 1628 and of the W. Strode impeached in 1642 has been questioned, but is now established (J. Forster, *Arrest of the Five Members*, p 198, note; *Life of Sir J. Eliot*, ed. 1872, ii. 237, note; J. L. Sanford, *Studies*, p. 397; Gardiner, *Hist. of England*, ix. 223). On the other hand he is to be distinguished from Colonel Wm. Strode of Barrington, also parliamentarian and M.P., who died in 1666; and from William Strode (1602 or 1600–1645), the orator, poet and dramatist, whose poetical works were edited, with a memoir, by Bertram Dobell in 1907.

STROMNESS, a police burgh and seaport, in the island of Pomona, county of Orkney, Scotland. Pop. (1901), 2450. It is situated on the side of a well-sheltered bay, 14 m. by steamer west of Kirkwall. Many of the houses are within tidal limits and furnished with quays and jetties. The harbour admits vessels of all sizes and is provided with a pier and slips. The deep-sea fishery attracts hundreds of boats from the north of Scotland, and most of the catch is cured for the English, German and Dutch markets. Stromness is in daily communication with Scrabster pier (Thurso), and at frequent intervals with Kirkwall by coach and also by steamer. It is a port of call for ships trading with the north of Europe as well as for vessels outward bound to the Arctic regions, Hudson Bay and Canada. The magnificent scenery of the west coast of Pomona is commonly visited from Stromness. The tour includes Black Craig (400 ft.), on which the schooner "Star of Dundee" was wrecked in 1834; the grand stacks of North Gaulton Castle and Yesnaby Castle; the Hole of Row, a natural arch carved out by the ocean; Birsay, where are the ruins of the palace built by Robert Stewart, earl of Orkney (d. 1592), natural son of James V., the traces of a church which is believed to have been built by Jarl Thorfinn on his return from Rome, in which the remains of St Magnus reposed until their burial in Kirkwall Cathedral, and, on the Broch of Birsay (95 ft. high), the ruins of St Peter's church.

STRONGYLION, a Greek sculptor, the author of a bronze figure of a horse set up on the Acropolis of Athens late in the 5th century B.C., which represented the wooden horse of Troy with the Greek heroes inside it and looking forth. The inscribed basis of this figure has been found. Other works of the sculptor were a figure of Artemis at Megara, a group of the Muses, and an Amazon which was greatly admired by the emperor Nero.

STRONTIANITE, a mineral consisting of strontium carbonate, $SrCO_3$. It takes its name from Strontian in Argyllshire, where it appears to have been known as far back as 1764, but it was not recognized as a distinct mineral until later, when the examination of it led to the discovery of the element strontium. It crystallizes in the orthorhombic system and is isomorphous with aragonite and witherite. Distinctly developed crystals are, however, of rare occurrence; they are usually acicular with acute pyramid-planes and are repeatedly twinned on the prism. Radiating, fibrous or granular aggregates are more common. The colour is white, pale green or yellowish brown. The hardness is $3\frac{1}{2}$ and the specific gravity 3·7. Strontium is sometimes partly replaced by an equivalent amount of calcium. The mineral occurs in metalliferous veins in the lead mines of Strontian in Argyllshire, Pateley Bridge in Yorkshire, Bräunsdorf near Freiberg in Saxony; abundantly in veins in calcareous marl near Münster and Hamm in Westphalia; and in limestone at Schoharie in New York. It is used for producing red fire in pyrotechny and for refining sugar. (L. J. S.)

STRONTIUM [Symbol Sr, atomic weight 87·62 ($O=16$)], a metallic chemical element belonging to the alkaline earth group. It is found in small quantities very widely distributed in various rocks and soils, and in mineral waters; its chief sources are the minerals strontianite, celestine and barytocelestine. The metal was detected in the mineral strontianite, found at Strontian in Argyllshire, by Cruikshank in 1787, and by Crawford in 1790; and the discovery was confirmed by Hope in 1792 and by Klaproth in 1793. The metal was isolated in 1807 by Sir H. Davy by electrolysing the moist hydroxide or chloride, and has been obtained by A. Guntz and Roederer (*Comptes rendus*, 1906, 142, p. 400) by heating the hydride in a vacuum to 1000°. By electrolysing an aqueous solution of the chloride with a mercury cathode, a liquid and a solid amalgam, $SrHg_{11}$, are obtained;

the latter on heating gives a mixture of Sr_2Hg_5 and $SrHg_6$, and on distillation an amalgam passes over, and not the metal. It is a silver-white ductile metal (of specific gravity 2·54) which melts at 800°. It oxidizes rapidly when exposed to air, and burns when heated in air, oxygen, chlorine, bromine or sulphur vapour. With dry ammonia at 60° the metal forms strontium ammonium, which slowly decomposes in a vacuum at 20° giving $Sr(NH_3)_2$; with carbon monoxide it gives $Sr(CO)_2$; with oxygen it forms the monoxide and peroxide, and with nitric oxide it gives the hyponitrite (Roederer, *Bull. soc. chim.*, 1906 [iii.], 35, p. 715).

The *hydride*, SrH_2, was obtained by Guntz on heating strontium amalgam in a current of hydrogen. It is a white solid, which readily decomposes water in the cold and behaves as a strong reducing agent. It dissociates when heated to a high temperature and is not affected by oxygen. The *monoxide* or strontia, SrO, is formed by strongly heating the nitrate, or commercially by heating the sulphide or carbonate in superheated steam (at about 500–600° C.). It is a white amorphous powder which resembles lime in its general character. By heating the amorphous form in the electric furnace H. Moissan succeeded in obtaining a crystalline variety. The amorphous form readily slakes with water, and the aqueous solution yields a crystalline hydrated hydroxide approximating in composition to $Sr(OH)_2 \cdot 8H_2O$ or $Sr(OH)_2 \cdot 9H_2O$, which on standing in vacuo loses some of its water of crystallization, leaving the monohydrated hydroxide, $Sr(OH)_2 \cdot H_2O$. The ordinary hydrated variety forms quadratic crystals and behaves as a strong base. It is used in the extraction of sugar from molasses, since it combines with the sugar to form a soluble saccharate, which is removed and then decomposed by carbon dioxide. A hydrated *dioxide*, approximating in composition to $SrO_2 \cdot 8H_2O$, is formed as a crystalline precipitate when hydrogen peroxide is added to an aqueous solution of strontium hydroxide.

Strontium fluoride, SrF_2, is obtained by the action of hydrofluoric acid on the carbonate, or by the addition of potassium fluoride to strontium chloride solution. It may be obtained crystalline by fusing the anhydrous chloride with a large excess of potassium hydrogen fluoride or by heating the amorphous variety to redness with an excess of an alkaline chloride. *Strontium chloride*, $SrCl_2 \, 6H_2O$, is obtained by dissolving the carbonate in hydrochloric acid, or by fusing the carbonate with calcium chloride and extracting the melt with water. It crystallizes in small colourless needles and is easily soluble in water; the concentrated aqueous solution dissolves bromine and iodine readily. By concentrating the aqueous solution between 90–130° C., or by passing hydrochloric acid gas into a saturated aqueous solution, a second hydrated form of composition, $SrCl_2 \cdot 2H_2O$, is obtained. The anhydrous chloride is formed by heating strontium or its monoxide in chlorine, or by heating the hydrated chloride in a current of hydrochloric acid gas. It is a white solid, which combines with gaseous ammonia to form $SrCl_2 \cdot 8NH_3$, and when heated in superheated steam it decomposes with evolution of hydrochloric acid.

Strontium sulphide, SrS, is formed when the carbonate is heated to redness in a stream of sulphuretted hydrogen. It phosphoresces very slightly when pure. *Strontium sulphate*, $SrSO_4$, found in the mineral kingdom as celestine, is formed when sulphuric acid or a soluble sulphate is added to a solution of a strontium salt. It is a colourless, amorphous solid, which is almost insoluble in water, its solubility diminishing with increasing temperature; it is appreciably soluble in concentrated sulphuric acid. When boiled with alkaline carbonates it is converted into strontium carbonate.

Strontium nitride, Sr_3N_2, is formed when strontium amalgam is heated to redness in a stream of nitrogen or by igniting the oxide with magnesium (H. R. Ellis, *Chem. News*, 1909, 99, p. 4). It is readily decomposed by water, with liberation of ammonia. *Strontium nitrate*, $Sr(NO_3)_2$, is obtained by dissolving the carbonate in dilute nitric acid. It crystallizes from water (in which it is very soluble) in monoclinic prisms which approximate in composition to $Sr(NO_3)_2 \cdot 4H_2O$ or $Sr(NO_3)_2 \cdot 5H_2O$. When heated it fuses in its own water of crystallization and becomes anhydrous at 110° C. It is used in pyrotechny for the manufacture of red-fire. A *strontium boride*, SrB_6, was obtained as a black crystalline powder by H. Moissan and P. Williams (*Comptes rendus*, 1897, 123, p. 633) by reducing the borate with aluminium in the electric furnace.

Strontium carbide, SrC_2, is obtained by heating strontium carbonate with carbon in the electric furnace. It resembles calcium carbide, decomposing rapidly with water, giving acetylene. *Strontium carbonate*, $SrCO_3$, found in the mineral kingdom as strontianite, is formed when a solution of a carbonate is added to one of a strontium salt. It is an amorphous solid, insoluble in water, but its solubility is increased in the presence of ammonium nitrate. It loses carbon dioxide when heated to high temperature.

Strontium salts may be recognized by the characteristic crimson colour they impart to the flame of the Bunsen burner and by the precipitation of the insoluble sulphate. On the preparation of pure strontium salts, see Adrian and Bougarel, *Journ. pharm. chem.*, 1892 (5), p. 345; and S. P. L. Soerenoen, *Zeit. anorg. chem.*, 1895, 11, p. 305. Recent determinations of the atomic weight of strontium are due to T. W. Richards (*Zeit. anorg. Chem.*, 1905, 47, p. 145), who, by estimating the ratios of strontium bromide and chloride to silver, obtained the values 87·663 and 87·661.

STROPHANTHUS, a genus of plants of the natural order Apocynaceae, deriving its name from the long twisted thread-like segments of the corolla, which in one species attain a length of 12 or 14 inches. The genus comprises about 30 species, mainly tropical African, extending into South Africa, with a few species in Asia, from farther India to the Philippines and China. Several of the African species furnish the natives with the principal ingredient in their arrow poisons. The inée or onaye poison of the Gaboon, the kombé of equatorial North Africa, the arquah of the banks of the Niger and the wanika of Zanzibar are all derived from members of this genus. The exact species used in each case cannot be said to be accurately known. There is no doubt, however, that *S. hispidus* and *S. kombé* are those most frequently employed.

Both *S. hispidus* and *S. kombé* have hairy seeds with a slender thread-like appendage, terminating in a feathery tuft of long silken hairs, the seeds of the former being coated with short appressed brown hairs, and those of the latter with white hairs; but in the species used at Delagoa Bay and called "umtsuli" the thread-like appendage of the seed is absent. The natives pound the seeds into an oily mass, which assumes a red colour, portions of this mass being smeared on the arrow immediately behind the barb.

Under the name of *strophanti semina*, the dried ripe seeds of *Strophanthus kombé*, freed from awns, are official in the British and many other pharmacopeias. The seeds must be mature. They are about $\frac{3}{5}$ in. long, $\frac{1}{6}$ in. broad, greenish fawn, covered with flattened silky hairs, and oval-acuminate in shape. They are almost odourless, but have an intensely bitter taste. The chief constituent is a white microcrystalline glucoside, known as strophanthin, freely soluble in water and alcohol, but not in chloroform or ether, and melting at about 173° C. It constitutes about 50% of the mature cotyledons of the seed, the proportion rising as maturity is reached. It is very similar to, but not identical with, onabaïn. It is split up by acids into strophanthidin and a methyl-ether of a peculiar sugar. The seeds also contain an active principle, *inein*, a body known as kombic acid, fat, resin and starch. The resin is contained in the husk, and occurs in the alcoholic tincture of strophanthus, its presence tending to cause digestive disturbance and diarrhoea. When the seeds are treated with sulphuric acid and heat is applied, a violet-coloration is produced. A section of the seed yields a green colour with cold sulphuric acid.

The British Pharmacopeia contains two preparations of this important and valuable drug, a dry extract and a tincture. The former is hardly ever prescribed. The official tincture is much inferior to that originally recommended by Sir Thomas Fraser, who introduced the drug into medical practice, in being much too weak, and in being prepared with alcohol instead of ether, which differs from alcohol in not dissolving the resin contained in the husks. It is therefore advisable to order the tincture of the British Pharmacopeia of 1885, or to prescribe the current tincture in double the official dose and combined with cardamoms, ginger or capsicum, in order to counteract the irritant properties of the resin which it contains.

Strophanthin itself may be injected hypodermically in doses of $\frac{1}{800}$ to $\frac{1}{80}$ grain. Unfortunately the injections usually cause some temporary local irritation. This method of exhibiting strophanthus is the only one of any avail when a result is wanted at once or even within several hours. Precisely the same observation applies to digitalis, the other great cardiac tonic.

Pharmacology.—The drug has no external actions. Taken internally it tends, after the repetition of large doses, to produce some gastric irritation. This is unquestionably less, however, than that produced by digitalis, and is probably due not at all to the active principle but entirely to the resin contained in the seed-husk. As ordinarily administered, the drug acts on the heart before influencing any other organ or tissue. Often indeed no other action can be observed. This is readily explained by the fact that the drug is carried by the coronary arteries to the cardiac muscle before it reaches any other part of the systemic circulation.

It is almost certain that strophanthus acts directly on no other cardiac structure than the muscle-fibre. No action can certainly be demonstrated either upon the terminals of the vagus nerves nor upon the intra-cardiac nervous ganglia. The muscular force is increased in a very marked degree. A secondary consequence of this is that the diastole is prolonged, and the pulse thus rendered less frequent. If the heart is beating irregularly the drug tends to make it more regular. The action is similar to that of digitalis—and fifty years ago both these drugs would thus have been regarded, as indeed digitalis was, as cardiac sedatives. As the cardiac muscle receives its blood supply only during diastole, it follows that strophanthus, while increasing the force of each beat, yet lengthens the period during which the muscle rests and is fed—thus being, in a paradoxical sense, a sedative as well as a stimulant. In fatal cases of strophanthus poisoning death is brought about by the arrest of the heart in systole, *i.e.* in a state of tetanic spasm from over-stimulation. This of course is a striking exception to the natural rule that death finds the heart in a state of relaxation and inability to contract. Strophanthus markedly raises the blood-pressure, but this action is proportional to and almost entirely due to the increased force of the heart; not, as in the case of digitalis, to constriction of the arterioles.

Its action on the heart causes strophanthus to exert a powerful diuretic action, especially in cases of dropsy of cardiac origin. It is a less powerful diuretic than digitalis as a rule. The drug has no action on the nervous system, but in toxic doses it powerfully affects the voluntary striped muscles. This action may be correlated with that exerted upon the cardiac muscle, which is striped, though not voluntary, and contrasted with its want of action upon the muscular fibre of the arteries, which is involuntary and non-striped.

The drug, like onabaïn, has a slight anaesthetic action when locally applied to the eyeball, and also causes contraction of the pupil.

Strophanthin is one of the most active and lethal of all known substances. One-hundredth of a grain will kill a mammal weighing four pounds, and one-third of a grain will kill a man of average weight. Serum containing one part of strophanthin in ten millions will arrest the frog's heart in systole.

Strophanthus is used therapeutically only as a cardiac stimulant. When given by the mouth it acts somewhat more rapidly than digitalis, being more soluble; but it is of course far less speedy in action than ether, ammonia or such a pseudo-stimulant as ethyl alcohol. In mitral disease of the heart especially strophanthus is an invaluable drug. It frequently succeeds when digitalis has failed; occasionally it fails where digitalis succeeds. It has the great advantage over digitalis of being non-cumulative, and can be administered continually for many weeks or even months at a time. It is never to be given in acute Bright's disease, but is frequently of use in chronic Bright's disease, where digitalis, owing to its influence on the already over-contracted arterioles, is absolutely contra-indicated.

STROPHE (Gr. στροφή, from στρέφειν, to turn), a term in versification which properly means a turn, as from one foot to another, or from one side of a chorus to the other. In its precise choral significance a strophē was a definite section in the structure of an ode, when, as in Milton's famous phrase in the preface to *Samson Agonistes*, "strophe, antistrophe and epode were a kind of stanzas framed only for the music." In a more general sense the strophe is a collection of various prosodical periods combined into a structural unit. In modern poetry the strophe usually becomes identical with the stanza, and it is the arrangement and the recurrence of the rhymes which give it its character. But the ancients called a combination of verse-periods a system, and gave the name *strophe* to such a system only when it was repeated once or more in unmodified form. It is said that Archilochus first created the strophe by binding together systems of two or three lines. But it was the Greek ode-writers who introduced the practice of strophe-writing on a large scale, and the art was attributed to Stesichorus, although it is probable that earlier poets were acquainted with it. The arrangement of an ode in a splendid and consistent artifice of strophe, antistrophe and epode was carried to its height by Pindar (see ODE). With the development of Greek prosody, various peculiar strophe-forms came into general acceptance, and were made celebrated by the frequency with which leading poets employed them. Among these were the Sapphic, the Elegiac, the Alcaic and the Asclepiadean strophe, all of them prominent in Greek and Latin verse. The briefest and the most ancient strophe is the dactylic distich, which consists of two verses of the same class of rhythm, the second producing a melodic counterpart to the first. The forms in modern English verse which reproduce most exactly the impression aimed at by the ancient ode-strophe are the elaborate rhymed stanzas of such poems as the "Nightingale" of Keats or the "Scholar-Gypsy" of Matthew Arnold (see VERSE).

STROSSMAYER, JOSEPH GEORGE [JOSIP JURAJ ŠTROSMAJER] (1815–1905), Croatian bishop and politician, was born at Esseg in Croatia-Slavonia on the 4th of February 1815. Strossmayer was of German descent and his parents had emigrated from Linz in Austria. He was educated at the Roman Catholic seminary of Djakovo, in his native country, and at Budapest, where he studied theology. In 1838 he took holy orders, and during the next ten years became lecturer on theology at Djakovo, chaplain to the Austrian emperor, and director of the Augustinian body at Rome. In 1849 he was consecrated bishop of Djakovo, with the official title "Bishop of Bosnia, Slavonia and Sirmium." He fostered the growth of Slavonic nationalism in Croatia-Slavonia, in Dalmatia, and among the Slovenes of south Austria, aiding the Ban Jellačić in his campaigns against Hungary (1848–49), and subsequently becoming a recognized leader of the opposition to Hungarian predominance (see CROATIA-SLAVONIA). Besides being foremost among the founders of the South Slavonic Academy in 1867, and of Agram University in 1874, he helped to reorganize the whole educational system of Dalmatia and Croatia-Slavonia. He built a palace and cathedral at Djakovo, founded a seminary for the Bosnian Croats, presented the South Slavonic Academy with a gallery of valuable pictures, and published collections of national songs and tales. He also aided Augustin Theiner, then librarian at the Vatican, to compile his *Vetera monumenta Slavorum meridionalium historiam illustrantia* (Rome, 1863). As a theologian, Strossmayer became prominent by his energetic opposition to the dogma of infallibility at the Vatican council of 1870, and by his denunciation of the Jesuits, while they in return charged him with allowing Roman Catholics to adopt the orthodox Greek confession. For years he refused to accept the doctrine of infallibility, but ultimately he yielded. Despite this attitude, he enjoyed the confidence of Pope Leo XIII. He headed the Slavonic deputations which visited Rome in 1881 and 1888, and won for them the retention of a Slavonic liturgy by the Roman Catholics of Illyria. Strossmayer withdrew from political life in 1888, in consequence of a rebuke administered to him by the emperor for his public expression of sympathy with Russia and his consistent hostility to Hungary. He died in his ninety-first year, on the 10th of April 1905. He was a count of the Holy Roman Empire, a bishop of the pontifical throne, and a member of the theological faculties of Budapest and Vienna. By Leo XIII. he was decorated with the archiepiscopal pallium.

STROUD, a market town in the Stroud parliamentary division of Gloucestershire, England, 102½ m. W. by N. of London. Pop. of urban district (1901), 9153. It is served by the Great Western railway and a branch of the west-and-north line of the Midland. It lies on the steep flank of a narrow and picturesque valley and traversed by the Thames and Severn and the Stroudwater canals, which unite at Wallbridge close by. The church of St Lawrence is modern excepting the tower and spire. The Elizabethan town-hall and the school of science and art, commemorating Queen Victoria, are noteworthy. Stroud is the principal seat of the west of England cloth manufacture, the industry extending to Stonehouse and other places in the vicinity. Stroud has also silk-mills, dyeworks, breweries, foundries, and a manufacture of umbrellas and walking-sticks.

There is no evidence of the existence of Stroud before the Conquest, and in 1087 it was still part of the manor of Bisley, from which it was separated in the reign of Edward II. It became a centre of the cloth trade in the Tudor period, and in 1607 Henry, Lord Danvers, lord of the manor, obtained a charter from James I., authorizing a weekly market. During the 18th century the commercial importance of the town increased, though, owing to its distance from any of the great high-roads and to the localization of the clothing trade in scattered factories near water power, it was never a great centre of population. By the Reform Act of 1832 Stroud became a borough and returned two members to parliament until 1885, when it was merged in the Stroud division of Gloucestershire. The manufacture of very fine broadcloth and of scarlet-dyed cloth has been carried on in the Stroud valley for centuries, the town being a distributing centre only, until the adoption of steam power and the erection of cloth factories in the town about 1830 led to considerable growth. Pin-making was introduced in 1835, carpet-weaving and iron-founding before 1850. Markets on Friday and Saturday are held under the grants of 1607 and 1832.

See *Victoria County History: Gloucestershire*; P. H. Fisher, *Notes and Recollections of Stroud* (1871); T. D. Fosbrooke, *Gloucestershire Records* (1807).

STROZZI, the name of an ancient and noble Florentine family, which was already famous in the 14th century. Palla Strozzi (1372–1462) played an important part in the public life of Florence, and founded the first public library in Florence in the monastery of Santa Trinita. Filippo Strozzi il Vecchio (1426–1491), son of Matteo and of Alessandra Macinghi, a famous literary woman, began to build the beautiful Strozzi palace in Florence. More celebrated was another Filippo Strozzi (1488–1538), who, although married to a Medici, opposed the hegemony of that house and was one of the leaders of the rising of 1527. On the final overthrow of the republic in 1530 Alessandro de' Medici attempted to win over Filippo Strozzi, but Strozzi had no faith in the tyrant and retired to Venice. After the murder of Alessandro he undertook the leadership of a band of republican exiles with the object of re-entering the city (1537); but having been defeated and captured and put to the torture, he committed suicide. His son Leone (1515–1554) was a distinguished admiral in the service of France and fought against the Medici; he died of a wound received while attacking Sarlino. Another Filippo (1541–1582) served in the French army, and was captured and killed by the Spaniards. Senator Carlo Strozzi (1587–1671) formed an important library and collected a valuable miscellany known as the *Carte Strozziane*, of which the most important part is now in the state archives of Florence; he was the author of a *Storietta della città di Firenze dal 1279 al 1292* (unpublished) and a *Storia della casa Barberini* (Rome, 1640). The Strozzi acquired by marriage the titles of princes of Forano, dukes of Bagnolo, &c. The Strozzi palace, which belonged to the family until 1907, was bequeathed by will to the Italian nation.

See A. Bardi, *Filippo Strozzi* (Florence, 1894); B. Niccolini, *Filippo Strozzi* (Florence); C. Guasti, *Le Carte Strozziane* (Florence, 1884–1891).

STRUENSEE, JOHAN FREDERICK (1731–1772), Danish political philosopher, was born at Halle in 1731. His father, subsequently superintendent-general of Schleswig-Holstein, was a rigid pietist; but young Struensee, who settled down in the 'sixties as a doctor at Altona, where his superior intelligence and elegant manners soon made him fashionable, revolted against the narrowness of his father's creed, became a fanatical propagandist of the atheism associated with the *Encyclopädie*, and scandalized his contemporaries by his frank licentiousness. But he was a clever doctor, and, having somewhat restored the king's health, and gained his affection, was retained as court physician, accompanied Christian VII. on a foreign tour and returned with him to Copenhagen. It had always been Struensee's ambition to play a great part in the world and realize his dream of reform. He had gathered from various Danish friends, most of them involuntary exiles of doubtful character, that the crazy, old-fashioned Dano-Norwegian state, misruled by an idiot, was the fittest subject in the world for the experiments of a man of superior ingenuity like himself; and he proceeded to worm his way to power with considerable astuteness.

First he reconciled the king and queen, for he calculated, shrewdly enough, that if the king was to be his tool he must needs make the queen his friend. At first Carolina Matilda disliked Struensee, but the unfortunate girl (she was scarce eighteen) could not fail to be deeply impressed by the highly gifted young doctor, who speedily and completely won her heart. By January 1770 he was notoriously her lover; a successful vaccination of the baby crown prince in May still further increased his influence; and when, in the course of the year, the king sank into a condition of mental torpor, Struensee's authority became paramount. Previously to this, the capable minister of foreign affairs, J. H. E. Bernstorff (*q.v.*), was got rid of by a royal letter of the 13th of September 1770, and Struensee's disreputable friend, the exiled Count Rantzau-Ascheburg, was recalled to court; and with him came another Altona acquaintance of Struensee's, Enevold Brandt, who had also been living abroad under a cloud.

For a time Struensee kept himself discreetly in the background, though from henceforth he was the wirepuller of the whole political machine. But he soon grew impatient of his puppets. In December the council of state was abolished; and Struensee appointed himself *maître de requêtes*. It was now his official duty to present to the king all the reports from the various departments of state; and, Christian VII. being scarcely responsible for his actions, Struensee dictated whatever answers he pleased. His next proceeding was to dismiss all the heads of departments, and to abolish the Norwegian stadholderships. Henceforth the cabinet, with himself as its motive power, was to be the one supreme authority in the state. Unfortunately, he had made up his mind to regenerate the benighted Danish and Norwegian nations on purely abstract principles, without the slightest regard for native customs and predilections, which in his eyes were prejudices. He was hampered, moreover, by not knowing a word of Danish. Many of his reforms, such, for instance, as the establishment of foundling hospitals, the abolition of capital punishment for theft and of the employment of torture in judicial process, the doing away with such demoralizing abuses as perquisites, and of "lackeyism," or the appointment of great men's domestics to lucrative public posts, were distinctly beneficial if not original. Unfortunately reform was not as much a principle as a mania with Struensee. The mere fact that a venerable institution still existed was a sufficient reason, in his eyes, for doing away with it. Changes which a prudent minister might have effected in a generation he rushed through in less than a fortnight. Between the 29th of March 1771 and the 16th of January 1772—the ten months during which he held absolute sway—he issued no fewer than 1069 cabinet orders, or more than three a day In order to be sure of obedience he dismissed wholesale without pension or compensation the staffs of all the public departments, substituting for old and experienced officials nominees of his own, in many cases untried men who knew little or nothing of the country they were supposed to govern.

The dictator's manners were even worse than his morals. He habitually adopted a tone of insulting superiority, all the more irritating as coming from an ill-informed foreigner; and sometimes he seemed deliberately to go out of his way to shock the most sacred feelings of the respectable people. Nor was this all. His system of retrenchment, on which he particularly prided himself, was in the last degree immoral and hypocritical, for while reducing the number of the public officials, or clipping down their salaries to starvation points, he squandered thousands upon balls, masquerades, and other amusements of the court, and induced the imbecile king to present him and his friend Brandt with 60,000 rix-dollars apiece.

Still, in spite of all his blunders and brutalities, it is clear that, for a short time at least, middle-class opinion was, on the whole, favourable to him; and, had he been wise, he might perhaps have been able to defy any hostile combination. But such was his contempt for the Danish people that he cared not a jot whether they approved or disapproved of his reforms. What incensed the people most against him was the way in which he put the king completely on one side; and this feeling was all the stronger as, outside a very narrow court circle, nobody seems to have believed that Christian VII. was really mad, but only that his will had been weakened by habitual ill usage; and this opinion was confirmed by the publication of the cabinet order of the 14th of July 1771, appointing Struensee "gehejme kabinetsminister," with authority to issue cabinet orders which were to have the force of royal ordinances, even if unprovided with the royal sign-manual.

Nor were Struensee's relations with the queen less offensive to a nation which had a traditional veneration for the royal house of Oldenburg, while Caroline Matilda's shameless conduct in public brought the Crown into contempt. The society which daily gathered round the king and queen excited the derision of the foreign ambassadors. The unhappy king was little more than the butt of his environment, and once, when he threatened his keeper, Brandt, with a flogging for some impertinence, Brandt, encouraged by Struensee and the queen, actually locked him in his room and beat him with his fists till he begged for mercy. Things were at their worst during the winter of 1771. Struensee, who had, in the meantime, created himself a count, now gave full rein to his licentiousness and brutality. If, as we are assured, he publicly snubbed the queen, we may readily imagine how he treated common folk. Before long the people had an opportunity of expressing their disgust openly. In the summer of 1771 Caroline Matilda was delivered of a daughter, who was christened Louisa Augusta; and a proclamation commanded that a "Te Deum" in honour of the event should be sung in all the churches; but so universal was the belief that the child was Struensee's that, at the end of the ordinary services, the congregation rose and departed *en masse.*

The general ill will against Struensee, which had been smouldering all through the autumn of 1771, found expression at last in a secret conspiracy against him, headed by Rantzau-Ascheburg and others, in the name of the queen-dowager Juliana Maria. Early in the morning of the 17th of January 1772 Struensee, Brandt and the queen were arrested in their respective bedrooms, and "the liberation of the king," who was driven round Copenhagen by his deliverers in a gold carriage, was received with universal rejoicing. The chief charge against Struensee was that he had usurped the royal authority in contravention of the *Kongelov.* He defended himself with considerable ability and, at first, confident that the prosecution would not dare to lay hands on the queen, he denied that their *liaison* had ever been criminal. But, on hearing that she was also a prisoner of state, his courage evaporated, and he was base enough to betray her, though she did all in her power to shield him. On the 25th of April Struensee and Brandt were condemned first to lose their right hands and then to be beheaded; their bodies were afterwards to be drawn and quartered. Sentence of death was the least that Struensee had to expect. He had undoubtedly been guilty of *lèse-majesté* and gross usurpation of the royal authority, both capital offences according to pars. 7 and 26 of the *Kongelov.* The sentences were carried out on the 28th of April, Brandt suffering first.

STRUTT, JEDEDIAH (1726–1797), British inventor and manufacturer, was born at South Normanton, Derbyshire, where his father occupied a farm, on the 28th of July 1726. He was educated at a good country school, with a view to becoming a farmer, but, showing great aptitude for mechanical arts, he was in 1740 articled for seven years to a wheelwright at Findern, near Derby. Here he lodged with a hosier, Woollatt, whose daughter he married in 1755. In the meantime he had inherited, from his uncle, the stock on a farm at Blackwell, near south Normanton, now, and probably then, the property of the duke of Devonshire. While in occupation of this farm his brother-in-law, William Woollatt, brought to his notice the efforts that had been unsuccessfully made to produce ribbed as well as plain goods on the stocking frame, and here he invented Strutt's Derby ribbing machine. Patents were taken out by Strutt and Woollatt in 1758 and 1759. Strutt went to live at Derby, and with his brother-in-law started a factory, "Derby Patent Ribs" at once becoming popular. In 1762 Strutt and Woollatt joined Samuel Need, a hosier of Nottingham, and carried on there and at Derby a very successful business. In 1768 they were approached by Richard Arkwright (*q.v.*), who had been recommended by Messrs Wright, bankers of Nottingham, to consult Need as to the possibilities of his cotton-spinning frame. Strutt at once realized its value, and was able to solve one or two minor difficulties which had interrupted the smooth working of the new mechanism. The firm of Arkwright, Strutt & Need started their first cotton mill at Nottingham, with horse power. Later works were erected at Cromford and, about 1780, after Strutt dissolved partnership with Arkwright, he built himself the mills at Belper and Milford, the greater part of which are still used. The partnership with Need had terminated in 1773 with the expiration of the patents. Shortly before this Strutt had made the discovery, which revolutionized the manufacture of calico, that cotton could be used throughout in its making. To house the machinery for this new invention the first fire-proof mill in England was built at Derby. In order to be near his work Strutt built, from his own designs, Milford House, near Belper, where he lived until 1795, when ill health compelled him to return to Derby. Here he died in 1797. He left three sons and two daughters.

His eldest son, William Strutt (1756–1830), was also of great mechanical ability. It was he who designed the calico factory above mentioned; he applied himself to the house-heating problem and, finally, invented the Belper stove. He also devised a self-acting spinning mule, which had however no great success. He was a fellow of the Royal Society. His son, Edward Strutt (1801–1880), was for some time M.P. for Derby, and in 1856 was raised to the peerage with the title of Baron Belper of Belper.

STRUVE, FRIEDRICH GEORG WILHELM (1793–1864), German astronomer, the son of Jacob Struve (1755–1841), was born at Altona on the 15th of April 1793. In 1808 he entered the university of Dorpat (Yuriev), where he first studied philology, but soon turned his attention to astronomy. From 1813 to 1820 he was extraordinary professor of astronomy and mathematics at the new university and observer at the observatory, becoming in 1820 ordinary professor and director. He remained at Dorpat, occupied with researches on double stars and geodesy till 1839, when he removed to superintend the construction of the new central observatory at Pulkowa near St Petersburg, afterwards becoming director. Here he continued his activity until he was obliged to retire in 1861, owing to failing health. He died at St Petersburg on the 23rd of November 1864.

Struve's name is best known by his observations of double stars, which he carried on for many years. These bodies had first been regularly measured by W. Herschel, who discovered that many of them formed systems of two stars revolving round their common centre of gravity. After him J. Herschel (and for some time Sir James South) had observed them, but their labours were eclipsed by Struve. With the 9½-in. refractor at Dorpat he discovered a great number of double stars, and published in 1827 a list of all the known objects of this kind (*Catalogus novus stellarum duplicium*). His micrometric measurements of 2714 double stars were made from 1824 to 1837, and are contained in his principal work, *Stellarum duplicium et multiplicium mensurae micrometricae* (St Petersburg, 1837 seq.; a convenient summary of the results is given in vol. i. of the *Dunecht Observatory Publications*, 1876). The places of the objects were at the same time determined with the Dorpat meridian circle (*Stellarum fixarum imprimis duplicium et multiplicium positiones mediae*, St Petersburg, 1852 seq.). At Pulkowa he redetermined the "constant of aberration," but was chiefly occupied in working out the results of former years' work and in the completion of the geodetic operations in which he had been engaged during the greater part of his life. He had commenced them with a survey of Livonia (1816–1819), which was followed by the measurement of an arc of meridian of more than 3½° in the Baltic provinces of Russia (*Beschreibung der Breitengradmessung in den Ostseeprovinzen Russlands*, 2 vols. 4to, Dorpat, 1831). This work was afterwards extended by Struve and General Tenner into a measurement of a meridional arc from the north coast of Norway to Ismail on the Danube (*Arc du méridien de 25° 20′ entre le Danube et la Mer Glaciale*, 2 vols. and 1 vol. plates, 4to, St Petersburg, 1857–1860). (See GEODESY; EARTH, FIGURE OF.)

His son OTTO WILHELM STRUVE (b. 1819), having studied at the academy at St Petersburg, became assistant at Pulkowa in 1839, and director in 1862 on his father's resignation. From 1847 to 1862 he was advising astronomer to the headquarters of the army and navy; chairman of the International Astronomical Congress from 1867–1878; acting president of the International Metric Commission in 1872; and president of the International Congress for a Photographic Survey of the Stars in 1887, in which year he was also made a privy councillor. His contributions to astronomy cover a wide field: a list of his publications is given in Poggendorff, *Biographisch-Litterarische*, vols. 2, 3, 4.

Another son, HEINRICH WILHELM STRUVE (b. 1822), studied chemistry, and obtained a public appointment as chemical expert to the administration of the Caucasus.

Two of Otto Wilhelm Struve's sons have also been prominent in the world of science. KARL HERMANN STRUVE (b. 1854) studied mathematics at Dorpat, and became in 1883 assistant, and in 1890, on his father's retirement, astronomer at the observatory at Pulkowa. In 1895 he became professor at the Albertus University and director of the observatory at Königsberg; and in 1904 he was called to Berlin as professor and director of the observatory there. His investigation of the Saturnian system was crowned by the Royal Astronomical Society of London in 1903. GUSTAV WILHELM LUDWIG STRUVE (b. 1858) studied at Dorpat, Bonn and Leipzig, and became observer at the Dorpat observatory in 1886. This post he retained until 1894, when he migrated to the university of Cracow as extraordinary professor, becoming in 1897 ordinary professor of astronomy and geodesy.

STRYCHNINE, $C_{21}H_{22}N_2O_2$, an alkaloid discovered in 1818 by Pelletier and Caventou in St Ignatius's beans (*Strychnos Ignatii*); it also occurs in other species of *Strychnos*, *e.g. S. Nux vomica*, *S. colubrina*, *S. Tieuté*, and is generally accompanied by another alkaloid brucine, $C_{23}H_{26}N_2O_4{\cdot}4H_2O$, which was isolated by Pelletier and Caventou in 1819. Strychnine crystallizes from alcohol in colourless prisms, which are practically insoluble in water, and with difficulty soluble in the common organic solvents. Its taste is exceptionally bitter. It has an alkaline reaction, and is a tertiary monacid base. It is optically active, the natural form being laevorotatory. Brucine closely resembles strychnine, and is its dimethoxy derivative. The constitutions are unknown (see J. Schmidt, *Die Alkaloidchemie*, 1904; 1909).

Medicine.—The B.P. dose of *strychnine* is $\frac{1}{60}$ to $\frac{1}{15}$ gr. in solution or in pill form. A preparation is *syrupus ferri phosphatis cum quinina et strychnina*, containing $\frac{1}{32}$ gr. of strychnine in each fluid drachm. *Strychninae hydrochloridum* is also used; it is much more soluble than strychnine. From it is prepared *liquor strychninae hydrochloridi*, containing 1 gr. of hydrochloride in 110 minims. The United States pharmacopoeia also contains *strychninae nitras* and *strychninae sulphas*. Strychnine is incompatible with liquor arsenicalis and potassium iodide.

Physiological Action.—Applied externally strychnine is a powerful antiseptic, but its poisonous nature prevents it from being used for this purpose. Brucine is a local anaesthetic. Strychnine enters the blood as such, being freely absorbed from mucous surfaces or when given hypodermically. Internally strychnine acts as a bitter, increasing the secretion of gastric juice and the intestinal peristalsis, being a direct stimulant to the muscular coat; in this manner it has a purgative action. The specific effects of the drug, however, are upon the central nervous system. It excites the motor areas of the spinal cord and increases their reflex irritability. Small doses increase the sensibility of touch, sight and hearing; large doses cause twitching of the muscles and difficulty in swallowing; while in overdose violent convulsions are produced. The cerebral convolutions remain unaffected, but the important centres of the medulla oblongata are stimulated. Not only is the respiratory centre stimulated but the cardiac centre is acted upon both directly by the drug and indirectly for a time by the enormous rise in blood pressure due to the contraction of the arterioles all over the body. Ordinary doses have no effect upon the temperature but in overdose the temperature rises during a convulsion. Strychnine is eliminated by the kidneys as strychnine and strychnic acid. It is excreted very slowly and therefore accumulates in the system.

Therapeutics.—Strychnine is chiefly used as a stimulant. It is indicated in paralyses (chiefly functional), and is most valuable in the treatment of post-diphtheritic paralysis. In progressive lead palsy, beri-beri, and the paralysis following acute alcoholism, fairly large doses are useful. In pneumonia and other acute disease, where the patient is liable to sudden collapse, a hypodermic injection of strychnine will often save the patient's life. In collapse following severe haemorrhage and in sudden and accidental arrest of the heart or respiration during chloroform narcosis an intramuscular injection of $\frac{1}{12}$ gr. of the hydrochloride may stimulate the cardiac action. In acute opium poisoning strychnine is very valuable. It is a physiological antagonist of chloral hydrate, morphine and physostigmine, and may be given in poisoning by these drugs. In dyspnoea due to emphysema, phthisis and asthma, strychnine is of service, given internally in doses of 1 to 3 minims of the liquor. The syrup of iron, quinine and strychnine is used as a tonic.

Toxicology.—The symptoms of strychnine poisoning usually appear within twenty minutes of the ingestion of a poisonous dose, starting with an uneasy sensation, stiffness at the back of the neck, twitching of the muscles and a feeling of impending suffocation. The patient is then seized with violent convulsions of a tetanic character; the arms are stretched out, respiration impeded, the muscles are rigid, the body is thrown into opisthotonos, *i.e.* it rests bowform on the head and the heels (occasionally the body is flexed forward [emprosthotonos], the eyes remain wide open and fixed, and the mouth is drawn aside (*risus sardonicus*). After a minute the muscles relax, and the patient sinks back exhausted, consciousness being preserved throughout. Any noise, a draught of air or a touch may cause a convulsion. If the case is about to terminate fatally the spasms rapidly succeed each other and death usually occurs within two hours, either from asphyxia produced by spasm of the respiratory muscles or more rarely from exhaustion. After death the position of the body may or may not be flexed; usually rigor mortis develops rapidly. In cases which recover the convulsions diminish in severity , leaving the patient exhausted. Complications are infrequent. The average fatal dose for an adult is $1\frac{1}{2}$ grs., but death has resulted in twenty minutes from $\frac{1}{2}$ grain. On the other hand, recovery has taken place after 5 and 10 and even 20 grains have been swallowed, but in the latter case an emetic was at once administered. Idiosyncrasy plays a considerable part in determining the effects, some people being particularly susceptible; death has occurred in five minutes from the appearance of the first symptoms, but when a narcotic has been administered at the same time as the poison the development is proportionately slow. Tetanus resembles strychnine poisoning, but the development of the symptoms in tetanus is usually much slower, death rarely occurring within 24 hours. In strychnine poisoning trismus or lockjaw is generally secondary to spasm of the other muscles, while in tetanus it is usually the first symptom, no relaxation taking place between the spasms.

The treatment of strychnine poisoning is to immediately evacuate the stomach with a stomach-pump or emetic, chloroform being administered to allay the spasms. If the patient can swallow, draughts of water containing tannic acid may be given. Nitrite of amyl inhalations are useful in the early stages when the respiratory muscles are freely movable. Chloral and potassium bromide may be given as physiological antidotes. If death from asphyxia appears imminent artificial respiration may be resorted to.

STRYETENSK, or SRYETENSK, a Cossack village of Asiatic Russia, in the province of Transbaikalia, 231 m. by rail E. of Chita, and a terminus of the Trans-Siberian railway. It is situated on both banks of the river Shilka, and its population of 8500 rises to over 10,000 during the season of navigation. Stryetensk has steam flour-mills and soap works.

STRYPE, JOHN (1643–1737), English historian and biographer, was born in Houndsditch, London, on the 1st of November 1643. He was the son of John Strype, or van Stryp, a member of a Brabant family who, to escape religious persecution, settled in London, in a place afterwards known as Strype's Yard in Petticoat Lane, as a merchant and silk throwster. The younger John was educated at St Paul's School, and on the 5th of July 1662 entered Jesus College, Cambridge; thence he proceeded to Catherine Hall, where he graduated B.A. in 1665 and M.A. in 1669. On the 14th of July of the latter year he became perpetual curate of Theydon Bois, Essex, and a few months afterwards curate and lecturer of Leyton in the same county. He was never instituted or inducted to the living of Leyton, but in 1674 he was licensed by the bishop of London to preach and expound the word of God, and to perform the full office of priest and curate while it was vacant, and until his death he received the profits of it. In 1711 he obtained from Archbishop Tenison the sinecure of West Tarring, Sussex, and he discharged the duties of lecturer at Hackney from 1689 till 1724. At the latter place he spent his last years with a married granddaughter, the wife of a surgeon, Thomas Harris, dying there on the 11th of December 1737, at the age of ninety-four. He was buried in the church at Leyton.

Through his friendship with Sir William Hicks Strype obtained access to the papers of Sir Michael Hicks, secretary to Lord Burghley, from which he made extensive transcripts; he also carried on an extensive correspondence with Archbishop Wake and Bishops Burnet, Atterbury and Nicholson. The materials thus obtained formed the basis of his historical and biographical works, which relate chiefly to the period of the Reformation. The greater portions of his original materials have been preserved, and are included in the Lansdowne manuscripts in the British Museum. His works can scarcely be entitled original compositions, his labour having consisted chiefly in the arrangement of his materials, but on this very account they are of considerable value as convenient books of reference, easier of access and almost as trustworthy as the original documents. The most important of Strype's works are the *Memorials of Thomas Cranmer, Archbishop of Canterbury, 1694* (ed. for the Eccl. Hist. Soc., in 3 vols., Oxford, 1848–1854; and in 2 vols. with notes by P. E. Barnes, London, 1853); *Life of the learned Sir Thomas Smith* (1698); *Life and Acts of John Aylmer, Lord Bishop of London* (1701); *Life of the learned Sir John Cheke, with his Treatise on Superstition* (1705); *Annals of the Reformation in England* (4 vols.; vol. i. 1709 [reprinted 1725], vol. ii. 1725, vol. iii. 1728, vol. iv. 1731; 2nd ed., 1735, 4 vols.; 3rd ed., 1736–1738, 4 vols.); *Life and Acts of Edmund Grindal, Archbishop of Canterbury* (1710), *of Matthew Parker, Archbishop of Canterbury* (1711), and *of John Whitgift, Archbishop of Canterbury* (1718); *An Accurate Edition of Stow's Survey of London* (1720), a valuable edition of Stow, although its interference with the original text is a method of editing which can scarcely be reckoned fair to the original author; and *Ecclesiastical Memorials* (3 vols., 1721; 3 vols., 1733). His *Historical and Biographical Works* were reprinted in 19 vols. at the Clarendon Press, Oxford, between 1812 (*Cranmer*) and 1824 (*Annals*). A general index by R. F. Laurence in 2 vols. was added in 1828. Strype also published, besides a number of single sermons, an edition of John Lightfoot's *Works* (1684); and in 1700 *Some genuine Remains of John Lightfoot . . . with a large preface concerning the author.*

STUART, ARABELLA (1575–1615), daughter of Charles Stuart, earl of Lennox, younger brother of Lord Darnley and of Elizabeth, daughter of Sir William Cavendish and "Bess of Hardwick," is interesting historically as having been (by strict pedigree) next in succession to James VI. of Scotland to the thrones of England and Scotland, after Queen Elizabeth. Her father's mother was Margaret Douglas, the daughter of Henry VII.'s daughter, Queen Margaret of Scotland, and the earl of Angus. She was born in 1575 and early became the centre of the intrigues of those who in Elizabeth's reign refused to accept James as her successor. Various suitors for her hand were proposed, including Henry IV. of France, the earl of Northumberland, and Esmé Stuart, duke of Lennox. In 1590 a plot was formed by the moderate section of the Roman Catholics of marrying her to Ranuccio, eldest son of the duke of Parma, who was descended from John of Gaunt, and of raising her with Spanish support to the throne. She was in consequence regarded with suspicion and disfavour by Elizabeth and closely watched and guarded at Hardwick by the dowager countess of Shrewsbury. In 1602 the queen's suspicions were increased by the discovery of a plot to marry Arabella to Edward, eldest son of Lord Beauchamp, who as grandson of Edward Seymour, earl of Hertford, and of Lady Catherine Grey (younger sister of Lady Jane Grey), was heir to the throne after Elizabeth according to the will of Henry VIII. According to other accounts the intended husband was Thomas Seymour, a younger son of the earl of Hertford. Arabella entered with ardour into the project, and planned an escape from Hardwick with the aid of her chaplain Starkey, who after its failure committed suicide. In December she wrote secretly to Lord Hertford proposing her marriage with his grandson, but the latter immediately informed the council. In February 1603 another attempt at escape failed, and she was then transferred to the care of the earl of Kent at Wrest House. The anxiety and anger aroused by her conduct was reputed to be the cause of Elizabeth's death the same year. When James I. had gained secure possession of the throne, Arabella was received at court and treated with favour, and she showed her fidelity to James by revealing a communication made to her by the conspirators in the Main and Bye Plots, in which her name had been used without her sanction. Every effort, however, was made to prevent her marriage. She is described at this time by Scaramelli, Venetian secretary in London, as "of great beauty and remarkable qualities, being gifted with many accomplishments, among them being the knowledge of Latin, French, Spanish, Italian, besides her native English"; as having "very exalted ideas, having been brought up in firm belief that she would succeed to the crown," as limited in means, of the Puritan persuasion, and very proud, insisting on a precedence over the princesses, though ordered back by the master of the ceremonies and in consequence being expelled from the court. A little later she is called "a regular termagant" and in 1607 "not very beautiful."[1] In December 1609 she planned an escape with Sir George Douglas to Scotland, apparently with a view of arranging a marriage with Stephen Bogdan, pretender to Moldavia, and on the scheme being discovered she was arrested. She was, however, restored to favour, granted a pension of £1600 a year by James, and given 10,000 crowns to pay her debts. But on the 2nd of February 1610 she became engaged to William Seymour, younger brother of Edward, and grandson of Lord Hertford, a suitor especially forbidden by James. A promise was exacted from them by the privy council that they would not marry without the king's consent, but nevertheless they were secretly married on the 22nd of June at Greenwich. Immediately it was known the culprits were imprisoned, Arabella at Lambeth and her husband in the Tower. In 1611 she was placed in charge of the bishop of Durham. Her application for a writ of habeas corpus was refused, and on the 16th of March she left London, progressing however, on account of illness and prostration, only as far as Barnet. She escaped on the 3rd of June 1611 disguised in man's clothing, and succeeded in getting on board a ship bound for Calais. Meanwhile her husband had also effected his escape and was sailing towards the French coast. Their two ships were drawing together when "a great wind arose and prevented them from seeing each other ever more."[2] Soon afterwards the unfortunate Arabella was captured and brought back to the Tower, where she spent the rest of her unhappy career. James was deaf to all intercession in her favour, and is reported to have answered the queen when pleading for her that "she had eaten of the forbidden fruit." In November 1613 a new plot for her escape failed. Abandoning at last all hope she sank into melancholy, ill health, and, according to some accounts, insanity, and died a victim to state policy on or about the 25th of September 1615. She was buried in the tomb of Mary Queen of Scots in Henry VII.'s chapel in Westminster Abbey. There appears to be no support for the statement that a child was born to her.

Her husband, after awaiting her in vain at Ostend, went on to Paris. He returned to England in 1616 after his wife's death and was restored to favour. He married in 1618 Frances, daughter of Robert Devereux, earl of Essex, became earl of Hertford by the death of his grandfather in 1621, and marquess in 1640. He took an active part in the civil war in Charles I.'s reign, was governor of the prince of Wales, and at the Restoration the dukedom of Somerset was revived in his favour. He died in 1660, and, on the failure of his male descendants in the person of his son John, 4th duke, the dukedom of Somserset passed to the descendants of his brother, Francis, Baron Seymour of Trowbridge, and, on the extinction of the latter's male line to the elder branch of the Seymour family, descended from Sir Edward Seymour of Berry Pomeroy, Devon.

STUART, GILBERT (1755–1828), American artist, was born at North Kingstown, Rhode Island, on the 3rd of December 1755. He studied at Newport, Rhode Island, with Cosmo Alexander, and went with him to Scotland, but returned to America after Alexander's death and obtained many portrait

[2] Lotti, Venetian secretary, writing on the 23rd of June. *Athenaeum*, vol. 97, ii. 353.

commissions. In 1775 he went to England, and became a pupil of Benjamin West in 1778. His work, however, shows none of the influence of West, and after four years Stuart set up a studio for himself in London, meeting with much success. Living beyond his means, he got into financial difficulties, and in 1788 escaped to Dublin. In London he had painted George III. and the future George IV., and in Paris had painted Louis XVI., and his success was no less great in Ireland. After five years he left Ireland for his native land in order to paint General Washington, who was said to be the only person in whose presence Stuart found himself embarrassed, and his first portrait Stuart felt was a failure; but Washington sat to him again, the result being the "Athenaeum" head on an unfinished canvas, showing the left side of the face. This remains the accepted likeness of Washington, of whom he also painted a full-length for Lord Lansdowne; of each of these portraits he executed many replicas. Among his portraits are those of Presidents Washington, John Adams, Thomas Jefferson, James Madison, James Monroe and John Quincy Adams, and John Jay, Governor Winthrop, Generals Gates and Knox, Bishop White, Chief Justice Shippen, John Singleton Copley, Sir Joshua Reynolds, Benjamin West, Lords Clinton, Lyndhurst, and Inchiquin, Sir Edward Thornton, Mme Patterson-Bonaparte and Horace Binney. Stuart's original colouring and technique, and his insight into character, make him not only one of the few great American artists, but one of the greatest portrait painters of his time. He settled at Boston in 1805, and died there on the 27th of July 1828.

See George C. Mason, *Life and Works of Gilbert Stuart* (New York, 1879).

STUART, JAMES EWELL BROWN (1833–1864), American soldier, was born in Virginia on the 6th of February 1833 and entered West Point military academy in 1850. Commissioned in 1854 second lieutenant of cavalry, he saw considerable service in Indian warfare, and took part also in the repression of civil disorder in Kansas. In 1855 he had married a daughter of Colonel Philip St George Cooke, who was regarded as the most capable cavalry officer in the United States service, and gave his son-in-law the benefit of his experience and judgment. In 1859 Stuart, while staying in Washington on official business, was sent to assist Colonel R. E. Lee in the suppression of the John Brown raid on Harper's Ferry. Two years later the Civil War presaged by the Kansas troubles and John Brown's expedition broke out, and when Virginia seceded Stuart resigned his commission in the United States army to share in the defence of his state. He had resigned as a lieutenant—a notification of his promotion to captain had actually crossed his letter of resignation in the post—but trained officers, especially of cavalry, were so scarce that he was at once made a colonel. With very little delay, and with the scantiest of formal training, his regiment was mustered into the Confederate army, and assigned to Joseph Johnston's force in the Shenandoah Valley. His men were mounted on their own horses, knew the country thoroughly, and in his capable hands soon made themselves proficient in outpost duty. In the opening campaign Stuart's command acted as a screen to cover Johnston's movement on Manassas, and at the first battle of Bull Run which followed, Stuart distinguished himself by his personal bravery. During the autumn and winter of 1861 he continued his outpost service and was somewhat severely handled by General Ord's force at the action of Dranesville. He was now promoted brigadier-general and placed in command of the cavalry brigade of the army of Northern Virginia. Just before the Seven Days' Battle (*q.v.*) he was sent out by Lee to locate the right flank of McClellan's army, and not only successfully achieved his mission, but rode right round McClellan's rear to deliver his report to Lee at Richmond. After the battle of Gaines's Mill on the 27th of June Stuart's cavalry raided McClellan's abandoned line of communication with White House, and his dismounted riflemen, aided by a light howitzer, successfully engaged a Federal gunboat on the Pamunkey. But such romantic and far-ranging raids on this occasion, as on several others, contributed little or nothing to the success of the army as a whole. In the next campaign, it is true, he had the good fortune, in his raid against General Pope's communications, not only to burn a great quantity of stores, but also, what was far more important, to bring off the headquarters' staff document of the enemy, from which Lee was able to discover the strength and positions of his opponents in detail. Stuart, now a major-general and commander of the cavalry corps, was present at the second battle of Bull Run, and during the Maryland campaign he brilliantly defended one of the passes of South Mountain (Crampton's Gap), thus enabling Lee to concentrate his disseminated army in time to meet McClellan's attack. After this battle the indefatigable troopers embarked upon a fresh raid, which, though without any definite object, had its value as an assertion of unbroken courage after the quasi-defeat of Antietam, and in addition wore out the Federal cavalry in vain efforts to pursue them. On this occasion the swift Virginians covered 80 miles in 27 hours and escaped with the loss of but three men. At Fredericksburg Stuart's cavalry were as usual in the flank of the army, and his horse artillery under Major Pelham rendered valuable service in checking Franklin's attack on "Stonewall" Jackson's corps by diverting a whole infantry division that formed part of Franklin's command. At Chancellorsville Stuart was specially appointed by Lee to take over command of the II. army corps after Jackson had been wounded, and though unused to commanding so large a force of all arms he acquitted himself so well in the second day's fighting that many considered that a grave injustice was done to him by the promotion of Major-General Ewell, Jackson's principal lieutenant, to fill the position left vacant by Jackson's death. The next campaign, Gettysburg, was preluded by the cavalry battle of Brandy Station, in which for the first time the Federal cavalry showed themselves worthy opponents for Stuart and his men. The march to the Potomac was screened by the cavalry corps, which held the various approaches on the right flank of the army, but at the crisis of the campaign Stuart was absent on a raid, and although he attempted to rejoin Lee during the battle, he was met and checked some miles from the field by General Gregg, so that the skill and courage which might have turned the scale in favour of Lee on the first and second days of the great battle were employed only in covering his retreat. The cavalry took part in the war of manœuvre between Meade and Lee in the autumn of 1863, and then went into winter quarters. Very shortly after the opening of the campaign of 1864 Stuart's corps was drawn away from Lee's army by the Union cavalry under Sheridan, and part of it, with which was Stuart himself, was defeated at Yellow Tavern on the 10th of May. Stuart himself was killed.

Stuart possessed the ardent and resolute character of the true cavalry leader, and although he was fortunate enough to command brigades and regiments exclusively composed of men who were both born horsemen and natives of Virginia, and to be opposed, for the first two years, by docile but unenterprising squadrons which were recruited in a more ordinary way, yet it was undeniable that he possessed the gift, indeed the genius, of a great leader. That his energy was sometimes squandered on useless raids was but natural, considering the character of his forces, but in regard to his performances in the more exhausting and far more vital service of security and reconnaissance, General Johnston could ask "How can I sleep unless he is on the outpost?" and General Lee could say "He never brought me a false report." Stuart preserved under all circumstances the gaiety of a cavalry subaltern and the personal character of an earnest Christian, and the army regarded his loss as almost as heavy a blow to the Confederate cause as that of Jackson.

See *Life* by H. B. McClellan (1885).

STUART, SIR JOHN, Count of Maida (1759–1815), British lieutenant-general, was born in Georgia. His father, Colonel John Stuart, was superintendent of Indian affairs in the southern district, and a prominent royalist in the War of Independence. Educated at Westminster School, young Stuart entered the 3rd Foot Guards in 1778, and almost immediately went to America with his regiment. He was present at the siege of

Charleston, the battles of Camden and Guildford court-house, and the surrender of Yorktown, returning a regimental lieutenant and an army captain, as was then usual in the Guards. Ten years later, as captain and lieutenant-colonel, he was present with the duke of York's army in the Netherlands and in northern France. He took part in the sieges and battles of the 1793 campaign, Valenciennes, Lincelles, Dunkirk and Lannoy. In the following year, now at the head of his battalion, he was present at Landrecies and at Pont-à-Chin or Tournay, and when the tide turned against the allies, he shared with his guards in the discomforts of the retreat. As a brigadier-general he served in Portugal in 1796, and in Minorca in 1799. At Alexandria, in 1801, his handling of his brigade called forth special commendation in general orders, and a year later he became substantive major-general. After two years in command of a brigade in Kent, Stuart went with Sir James Craig to the Mediterranean. The English were employed along with Lacy's Russians in the defence of the kingdom of Naples, but Austerlitz led to the recall of the Russian contingent, and the British soon afterwards evacuated Italy. Thus exposed, Naples fell to the advancing troops of Masséna, but Gaëta still held out for King Ferdinand, and Masséna's main force soon became locked up in the siege of this fortress. Stuart, who was in temporary command, realized the weakness of the French position in Calabria, and on the 1st of July 1806 swiftly disembarked all his available forces in the gulf of S. Euphemia. On the 4th the British, 4800 strong, won the celebrated victory of Maida over Reynier's detachment. Nothing, however, was done to follow up this success, as Stuart was too weak to shake Masséna's foothold in Naples. After besieging and taking the castle of Scylla, the little force returned to Messina. Besides the dignity of count of Maida from the court of Palermo, Stuart received the thanks of parliament and an annuity of £1000, as well as the K.C.B. Superseded by two other generals, Fox and Moore, the latter of whom was his junior, Stuart came home in 1806. A year later, however, as a lieutenant-general, he received the Mediterranean command, which he held until 1810. His operations were confined to south Italy, where Murat, king of Naples, held the mainland, and the British and Neapolitan troops held Sicily for the Bourbon king. Of the events of this time may be mentioned the failure to relieve Colonel Hudson Lowe at Capri, the expedition against Murat's gunboats in the bay of Naples and the second siege of Scylla. The various attempts made by Murat to cross the straits uniformly failed, though on one occasion the French actually obtained a footing in the island. In 1810 Stuart returned to England. He died at Clifton in 1815. Two months previously he had received the G.C.B.

STUART, JOHN M'DOUALL (1818–1866), South Australian explorer, was born at Dysart in Fifeshire, Scotland, in 1818, and arrived in the colony about 1839. He accompanied Captain Sturt's 1844–1845 expedition as draughtsman, and between 1858 and 1862 he made six expeditions into the interior, the last of which brought him on the 25th of July to the shores of the Indian Ocean at Van Diemen's Gulf, at the mouth of the Adelaide River. Stuart was not the first to cross the island continent from south to north; that honour belongs to the Burke and Wills expedition, which reached the Gulf of Carpentaria on the 6th of February 1861. Stuart returned to Adelaide exhausted and broken, and never recovered from the effects of the great privations which he suffered. He returned to England, where he died on the 5th of June 1866. Stuart was rewarded with £3000 and a grant of 1000 sq. m. of grazing country in the interior rent free for seven years. His name is perpetuated by Central Mount Stuart.

STUART, MOSES (1780–1852), American biblical scholar, was born in Wilton, Connecticut, on the 26th of March 1780. He was reared on a farm; graduated with highest honours at Yale in 1799; in 1802 was admitted to the Connecticut bar, and was appointed a tutor at Yale, where he remained for two years; and in 1806 became pastor of the Centre (Congregational) Church of New Haven. In 1810 he was appointed professor of sacred literature in the Andover Theological Seminary, organized in 1808. Here he succeeded Eliphalet Pearson (1752–1826), the first preceptor of the Phillips (Andover) Academy and in 1786–1806 professor of Hebrew and Oriental languages at Harvard. Stuart himself then knew hardly more than the elements of Hebrew and not very much more Greek than Hebrew; in 1810–1812 he prepared for the use of his students a Hebrew grammar which they copied day by day from his manuscript; in 1813 he printed his *Grammar*, which appeared in an enlarged form, "with a copious syntax and praxis," in 1821, and was republished in England by Dr Pusey in 1831. He gradually made the acquaintance of German works in hermeneutics, first Schleusner, Seiler and Gesenius, and taught himself German, arousing much suspicion and distrust among his colleagues by his unusual studies. But his recognition soon came, partly as a result of his *Letter to Dr Channing on the Subject of Religious Liberty* (1830), but more largely through the growing favour shown to German philology and critical methods. In 1848 he resigned his chair at Andover. He died in Andover on the 4th of January 1852. He has been called the "father of exegetical studies in America." He contributed largely by his teaching to the renewal of foreign missionary zeal—of his 1500 students more than 100 became foreign missionaries, among them such skilled translators as Adoniram Judson, Elias Riggs and William G. Schauffler.

Among his more important publications were: Winer's *Greek Grammar of the New Testament* (1825), with Edward Robinson; *Commentary on the Epistle to the Hebrews* (1827–1828); *Commentary on the Epistle to the Romans* (1832); *Commentary on the Apocalypse* (1845); *Miscellanies* (1846); Gesenius's *Hebrew Grammar* (1846), a version which involved Stuart in a long controversy with T. J. Conant, the earlier, and possibly more scholarly, translator of Gesenius; *Commentary on Ecclesiastes* (1851), and *Commentary on the Book of Proverbs* (1852).

See the memorial sermons by Edwards A. Park (Boston, 1852) and William Adams (New York, 1852).

STUBBS [Stubbe], **JOHN** (*c.* 1543–1591), English pamphleteer, was born in Norfolk about 1543. He was educated at Trinity College, Cambridge, and after studying law at Lincoln's Inn, took up his residence at Thelveton, Norfolk. His views were Puritan, and he regarded with disgust the negotiations for a marriage between Queen Elizabeth and the duke of Anjou. In 1579 he put his opinions into a pamphlet entitled *The Discoverie of a Gaping Gulf whereinto England is like to be Swallowed by another French Marriage*. The circulation of this pamphlet was prohibited, and Stubbs, his printer, and publisher were tried at Westminster, found guilty, and sentenced to have their right hands cut off. The printer was subsequently pardoned, but in the case of Stubbs and his publisher the sentence was duly carried out. Stubbs protested his loyalty from the first. His right hand having been cut off, he removed his hat with his left, and cried "God Save the Queen!" before fainting away. He was subsequently imprisoned for eighteen months. On being released he continued to write, publishing, among other pamphlets, a reply to Cardinal Allen's *Defence of the English Catholics*. He died in 1591 at Havre, France, where he seems to have gone to volunteer for military service under Henry of Navarre.

STUBBS [Stubbes], **PHILIP** (*c.* 1555–*c.* 1610), English pamphleteer, was born about 1555. He is reputed to have been a brother or near relation of John Stubbs (*q.v.*). He was educated at Cambridge and subsequently at Oxford, but did not take a degree, spending the greater portion of his time travelling about the country. He started writing about 1581, and in 1583 published *The Anatomie of Abuses*. This consisted of a virulent attack on the manners, customs, amusements and fashions of the period, and is still valuable for its copious information on those matters. In 1591 Stubbs published *A Christal Glass for Christian Women*, of which at least seven editions were called for, and he followed this with other semi-devotional works. He died, probably, about 1610.

STUBBS, WILLIAM (1825–1901), English historian and bishop of Oxford, son of William Morley Stubbs, solicitor, of Knaresborough, Yorkshire, was born on the 21st of June 1825, and was educated at the Ripon grammar school and Christ Church, Oxford, where he graduated in 1848, obtaining a first-class in classics and a third in mathematics. He was elected a fellow of Trinity College, and held the college living of Navestock, Essex, from 1850 to 1866. He was librarian at Lambeth, and in 1862 was an unsuccessful candidate for the Chichele professorship of modern history at Oxford. In 1866 he was appointed regius professor of modern history at Oxford, and held the chair until 1884. His lectures were thinly attended, and he found them grievous interruptions to his historical work. Some of his statutory lectures are published in his *Lectures on Mediaeval and Modern History*. He was rector of Cholderton, Wiltshire, from 1875 to 1879, when he was appointed a canon of St Paul's. He served on the ecclesiastical courts commission of 1881–1883, and wrote the weighty appendices to the report. On the 25th of April 1884 he was consecrated bishop of Chester, and in 1889 was translated to the see of Oxford.

Until Bishop Stubbs found it necessary to devote all his time to his episcopal duties, he pursued historical study with unremitting diligence. He rejected the theory of the unity and continuity of history so far as it would obliterate distinctions between ancient and modern history, holding that, though work on ancient history is a useful preparation for the study of modern history, either may advantageously be studied apart. He urged that history is not to be treated as an exact science, and that the effects of individual character and the operations of the human will necessarily render generalizations vague and consequently useless. While pointing out that history has a utility as a mental discipline and a part of a liberal education, he recommended its study chiefly for its own sake, for the truth's sake and for the pleasure which it brings. It was in this spirit that he worked; and his intellectual character was peculiarly fitted for his work, for he was largely endowed with the faculty of judgment and with a genius for minute and critical investigation. He was eminent alike in ecclesiastical history, as an editor of texts and as the historian of the English constitution. His right to be held as an authority on ecclesiastical history was proved in 1858 by his *Registrum sacrum anglicanum*, which sets forth episcopal succession in England, by many other later works, and particularly by his share in *Councils and Ecclesiastical Documents*, edited in co-operation with the Rev. A. W. Haddan, for the third volume of which he was specially responsible. His place as a master in critical scholarship and historical exposition is decided beyond debate by the nineteen volumes which he edited for the Rolls series of *Chronicles and Memorials*. It is, however, by his *Constitutional History of England* that he is most widely known as a historian. The appearance of this book, which traces the development of the English constitution from the Teutonic invasions of Britain till 1485, marks a distinct step in the advance of English historical learning. Specialists may here and there improve on a statement or a theory, but it will always remain a great authority, a monument of patient and exhaustive research of intellectual power, and of ripe and disciplined judgment. Its companion volume of *Select Charters and other Illustrations of English Constitutional History*, admirable in itself, has a special importance in that its plan has been imitated with good results both in England and the United States.

Bishop Stubbs belongs to the front rank of historical scholars both as an author and a critic. Among Englishmen at least he excels all others as a master of every department of the historian's work, from the discovery of materials to the elaboration of well-founded theories and literary production. He was a good palaeographer, and excelled in textual criticism, in examination of authorship, and other such matters, while his vast erudition and retentive memory made him second to none in interpretation and exposition. His carefulness was exemplary, and his references are always exact. His merits as an author are often judged solely by his *Constitutional History*. The learning and insight which this book displays are unquestionable: it is well planned, and its contents are well arranged; but constitutional history is not a lively subject, and, in spite of the skill with which Stubbs handled it and the genius displayed in his narrative chapters, the book does not afford an adequate idea of his place as a writer of history. What that is cannot be determined without taking into account the prefaces to some of the volumes which he edited for the Rolls series. Several of them contain monographs on parts, or the whole, of the author's work, written with remarkable literary skill. In these his language is vigorous and dignified; he states the results of his labour and thought with freshness and lucidity; tells numberless stories in a most delightful manner, and exhibits a wonderful talent for the representation of personal character; the many portraits of historic persons of all orders which he draws in these prefaces are as brilliant in execution as they are exact and convincing. Among the most notable examples of his work for the Rolls series are the prefaces to Roger of Hoveden, the *Gesta regum* of William of Malmesbury, the *Gesta Henrici II.*, and the *Memorials of St. Dunstan*. Both in England and America Bishop Stubbs was universally acknowledged as the head of all English historical scholars, and no English historian of his time was held in equal honour in European countries. Among his many distinctions he was D.D. and hon. D.C.L. of Oxford, LL.D. of Cambridge and Edinburgh, Doctor *in utroque jure* of Heidelberg; an hon. member of the university of Kiev, and of the Prussian, Bavarian and Danish academies; he received the Prussian order *Pour le mérite*, and was corresponding member of the Académie des sciences morales et politiques of the French Institute.

Stubbs was a High Churchman whose doctrines and practice were grounded on learning and a veneration for antiquity. His opinions were received with marked respect by his brother prelates, and he acted as an assessor to the archbishop in the trial of the bishop of Lincoln. His tastes were those of a student, and he did not disguise his dislike of public functions and the constant little journeys which take up so much of a bishop's time. Nevertheless he fulfilled all his episcopal duties with diligence, and threw all his heart into the performance of those of a specially spiritual nature, such as his addresses at confirmations and to those on whom he conferred orders. As a ruler of the Church he showed wisdom and courage, and disregarded any effort to influence his policy by clamour. In character he was modest, kind and sympathetic, ever ready to help and encourage serious students, generous in his judgment of the works of others, a most cheery companion, full of wit and humour. His wit was often used as a weapon of defence, for he did not suffer fools gladly. An attack of illness in November 1900 seriously impaired his health. He was able, however, to attend the funeral of Queen Victoria on the 2nd of February 1901, and preached a remarkable sermon before the king and the German emperor on the following day. His illness became critical on the 20th of April, and he died on the 22nd. In 1859 he had married Catherine, daughter of John Dollar, of Navestock, and had a numerous family.

See *Letters of William Stubbs, Bishop of Oxford*, ed. W. H. Hutton.

(W. Hu.)

STUCCO (Ital. *stucco*, adapted from O.H.G. *stucchi*, crust, piece, patch, Ger. *Stück*, piece, allied to stock), a kind of plaster used for the covering of walls, or for decorative or ornamental features such as cornices, mouldings, &c., or for ceilings. The stucco used as an exterior covering for brick or stone work is coarse; a finer kind is used for decorative purposes. (See PLASTER-WORK.)

STUCK, FRANZ (1863–), German painter, was born at Tettenweis, in Bavaria, and received his artistic training at the Munich Academy. He first made a name with his illustrations for *Fliegende Blätter*, and vignette designs for programmes and book decoration. He did not devote himself to painting till after 1889, the year in which he achieved a marked success with his first picture, " The Warder of Paradise." His style in painting is based on a thorough mastery of design, and is sculptural rather than pictorial. His favourite subjects are of mythological and allegorical character, but in his treatment of time-worn motifs he is altogether unconventional. A statuette of an athlete, bronze casts of which are at the Berlin and Budapest national galleries and the Hamburg Museum, affords convincing proof of his talent for plastic art. Among his paintings the best known are "Sin" and "War," at the Munich Pinakothek, "The Sphinx," "The Crucifixion," "The Rivals," "Paradise Lost," "Oedipus," "Temptation," and "Lucifer." Though Stuck was one of the leaders of the Munich *Sezession*, he enjoyed an appointment of professor at the academy.

STUCLEY (or Stukely), **THOMAS** (*c.* 1525–1578), English adventurer, son of Sir Hugh Stucley, of Affleton, near Ilfracombe, a knight of the body to King Henry VIII., was supposed by some of his contemporaries to have been an illegitimate son of the king. He was a standard-bearer at Boulogne from 1547 to 1550, entered the service of the duke of Somerset, and after his master's arrest in 1551 a warrant was issued against him, but he succeeded in escaping to France, where he served in the French army. His military talents brought him under the notice of Montmorency, and he was sent with a letter of recommendation from Henry II. of France to Edward VI. On his arrival he proceeded on the 16th of September 1552 to reveal the French plans for the capture of Calais and for a descent upon England, the furtherance of which had, according to his account, been the object of his mission to England. Northumberland evaded the payment of any reward to Stucley, and sought to gain the friendship of the French king by pretending to disbelieve Stucley's statements. Stucley, who may well have been the originator of the plans adopted by the French, was imprisoned in the Tower for some months. A prosecution for debt on his release in August 1553 compelled him to become a soldier of fortune once more, but he returned to England in December 1554 in the train of Philibert, duke of Savoy, after obtaining security against his creditors. He temporarily improved his fortunes by marrying an heiress, Anne Curtis, but in a few months had to return to the duke of Savoy's service. As early as 1558 he was summoned before the council on a charge of piracy, but was acquitted on the ground of insufficient evidence. In 1562 he obtained a warrant permitting him to bring French ships into English ports although England and France were nominally at peace. With six ships, one of which was supplied by Queen Elizabeth, he started buccaneering against French, Spanish and Portuguese ships, though his commission was concerned with an expedition to Florida. Repeated remonstrances on the part of the offended powers compelled Elizabeth to disavow Stucley, who surrendered in 1565, but his prosecution was merely formal.

He had met Shane O'Neill at the English court in the winter of 1561–1562, and was employed in 1566 by Sir Henry Sidney in a vain effort to induce the Irish chief to enter into negotiations with the government. Sidney desired to allow Stucley to purchase the estates and office of Sir Nicholas Bagnall, marshal of Ireland, for £3000, but Elizabeth refused to permit the transaction. Undeterred by this failure, Stucley bought lands and the office of seneschal of Wexford from Sir Nicholas Heron, but in June 1568 he was dismissed, and in the next year imprisoned in Dublin Castle on a charge of high treason, but was released in October. He now offered his services to Fenelon, the French ambassador in London, and was thenceforward continuously engaged in schemes against Elizabeth. Philip II. invited him to Madrid and loaded him with honours. He was known at the Spanish court by the curious title of "duke of Ireland," and was established with a handsome allowance in a villa near Madrid. He was knighted in 1571, and prepared to become a member of a religious order of knighthood. His credit with Spain was seriously injured by another Irish malcontent, Maurice Gibbon, archbishop of Cassel; but Stucley, who now desired to leave Spain, only obtained his passports after Elizabeth had demanded his dismissal. He commanded three galleys under Don John of Austria at the battle of Lepanto. His exploits restored him to favour at Madrid, and on the 2nd of March 1572 he was at Seville, offering to hold the narrow seas against the English with a fleet of twenty ships. In four years (1570–1574) he is said to have received over 27,000 ducats from Philip II. Wearied by the Spanish king's delays he sought more serious assistance from the new pope, Gregory XIII., who aspired to make his illegitimate son, Giacomo Buoncompagno, king of Ireland. He set sail from Civita Vecchia in March 1578, but put into Lisbon, where he was to meet his confederate, James Fitzmaurice Fitzgerald, and to secure better ships before sailing for Ireland. There he was turned from his purpose by King Sebastian, with whom he sailed for Morocco. He commanded the centre in the battle of Alcazar on the 4th of August 1578, and was killed, in fair fight apparently, though tradition asserted that he was murdered by his Italian soldiers after the battle.

Stucley's adventurous career made considerable impression on his contemporaries. A play generally assigned to George Peele, *The Battell of Alcazar . . . with the Death of Captain Stukely*, printed by E. Allde in 1594, was probably acted in 1592, and is perhaps identical with a popular piece referred to by Henslowe as *Muley surnamed Abdelmilech*. It deals with Stucley's arrival in Lisbon and his Moorish expedition, but in a long speech before his death he recapitulates the events of his life. A later piece, *The Famous History of the Life and Death of Captain Thomas Stukeley*, printed for Thomas Panyer (1605), which is possibly the *Stewtley* played, according to Henslowe, on the 11th of December 1596, is a biographical piece dealing with successive episodes, and seems to be a patchwork of older plays on Don Antonio and on Stucley. His adventures also form the subject of various ballads.

There is a detailed biography of Stucley, based chiefly on the English, Venetian and Spanish state papers, in R. Simpson's edition of the 1605 play (*School of Shakespeare*, 1878, vol. i.), where the Stucley ballads are also printed. References in contemporary poetry are quoted by Dyce in his introduction to the *Battle of Alcazar* in Peele's *Works*.

STUD. (1) A number of horses kept for the purpose of breeding, also the place or establishment where they are kept; similarly, a "stud horse," a stallion, "stud groom," the head groom of a stud, "stud-book," the register containing the pedigree of thoroughbred horses. The word in Old English is *stod*, and cognate forms are found in Icelandic and Danish, cf. also German *Gestüt*; steed, now a literary word for horse, meant in Old English (*steda*) a stud-horse, and is the same as stud in origin. The root to which the word is referred is *sta-*, to stand. A stud meant, therefore, an establishment. (2) A word which is used of many different objects, the primary meaning being a "prop" or support. The Old English word is *studu*, and cognates are found in Danish, Swedish and Icelandic. The ultimate origin is also the root *sta-*, to stand. The chief applications of the term are as follows: in architecture, to a post; quarter or upright in wooden partitions; to the transverse pieces of iron which strengthen the links of a chain; to a boss or knob inserted on a belt, collar, or piece of armour, often decorated and forming an ornamentation; and, particularly, to a species of button, consisting of a rounded head, neck and flat base, used for fastening a collar, shirt, &c.

STUDER, BERNHARD (1794–1887), Swiss geologist, was born at Buren, near Berne, in August 1794. Although educated as a clergyman, he became so interested in geology at the university of Göttingen that he devoted his life to its pursuit. He subsequently studied at Freiburg, Berlin and Paris, and in 1816 was appointed teacher of mathematics and physics in the Berne Academy. In 1825 he published *Beyträge zu einer Monographie der Molasse*. Later on he commenced his detailed investigations of the western Alps, and published in 1834 his *Geologie der westlichen Schweizer-Alpen*. In the same year, largely through his influence, the university of Berne was established and he became the first professor of mineralogy. His *Geologie der Schweiz* in two vols. (1851–1853), and his geological maps of Switzerland prepared with the assistance of Arnold Escher von der Linth, are monuments of his research. In 1859 he organized the geological survey of Switzerland, being appointed president of the commission, and retaining this position until the close of his life. It has been remarked by Marcou that Studer was present at the first meeting of the Société helvétique des sciences naturelles at Geneva on the 6th of October 1815, and remained a member during 72 years. He was awarded the Wollaston medal by the Geological Society of London, 1879. He died at Berne on the 2nd of May 1887.

Obituary by Jules Marcou, *Ann. rep. amer. acad. sci.* for 1888.

STUKELEY, WILLIAM (1687–1765), English antiquary, was born at Holbeach, Lincolnshire, on the 7th of November 1687, the son of a lawyer. After taking his M.B. degree at Cambridge, he went to London and studied medicine at St Thomas's Hospital. In 1710 he started in practice in Lincolnshire, removing in 1717 to London. In the same year he became a fellow of the Royal Society, and, in 1718, joined in the establishment of the Society of Antiquaries, acting for nine years as its secretary. In 1719 he took his M.D. degree and in 1720 became a fellow of the Royal College of Physicians, publishing in the same year his first contribution to antiquarian literature. His principal work, an elaborate account of Stonehenge, appeared in 1740, and he wrote copiously on other supposed Druid remains, becoming familiarly known as the "Arch-Druid." In 1729 he took holy orders, and, after holding two livings in Lincolnshire, was appointed rector of a parish in Bloomsbury, London. He died in London on the 3rd of March 1765.

STUMPF, JOHANN (1500–1576), one of the chief writers on Swiss history and topography, was born at Bruchsal (near Carlsruhe). He was educated there and at Strassburg and Heidelberg. In 1520 he was received as a cleric or chaplain into the order of the Knights Hospitallers or of St John of Jerusalem, was sent in 1521 to the preceptory of that order at Freiburg in Breisgau, ordained priest in Basel, and in 1522 placed in charge of the preceptory at Bubikon (north of Rapperswil, in the canton of Zürich). But Stumpf soon went over to the Protestants, was present at the great Disputation in Berne (1528), and took part in the first Kappel War (1529). He had carried over with him most of his parishioners whom he continued to care for, as the Protestant pastor at Bubikon, till 1543, then becoming pastor at Stammheim (same canton) till 1561, when he retired to Zürich (of which he had been made a burgher in 1548), where he lived in retirement till his death in 1576. In 1529 he married the first of his four wives, a daughter of Heinrich Brennwald (1478–1551), who wrote a work (still in MS.) on Swiss history, and stimulated his son-in-law to undertake historical studies. Stumpf made wide researches, with this object, for many years, and undertook also several journeys, of which that in 1544 to Engelberg and through the Valais seems to be the most important, perhaps because his original diary has been preserved to us. The fruit of his labours (completed at the end of 1546) was published in 1548 at Zürich in a huge folio of 934 pages (with many fine wood engravings, coats of arms, maps, &c.), under the title of *Gemeiner loblicher Eydgnossenschaft Stetten, Landen, und Volckeren chronikwirdiger Thaaten Beschreybung* (an extract from it was published in 1554, under the name of *Schwytzer Chronika*, while new and greatly enlarged editions of the original work were issued in 1586 and 1606). The woodcuts are best in the first edition, and it remained till Scheuchzer's day (early 18th century) the chief authority on its subject. Stumpf also published a monograph (very remarkable for the date) on the emperor Henry IV. (1556) and a set of laudatory verses (*Lobsprüche*) as to each of the thirteen Swiss cantons (1573). (W. A. B. C.)

STURDZA, or Sturza, the name of an ancient Rumanian family, of unknown origin, which probably came from Trebizond and settled in Moldavia. The Sturdza family has been long and intimately associated with the government first of Moldavia and afterwards of Rumania. Its members belong to two main divisions, which trace their descent respectively from John (Ioan) or from Alexander (Sandu), the sons of Kirak Sturdza, who lived in the 17th century, and may be regarded as the founder of the family.

1. To the first division belongs Michael [Michail] Sturdza (1795–1884), who was prince of Moldavia from 1834 to 1849. A man of liberal education, he established the first high school, a kind of university, in Jassy. He brought scholars from foreign countries to act as teachers, and gave a very powerful stimulus to the educational development of the country. In 1844 he decreed the emancipation of the gipsies. Until then the gipsies had been treated as slaves and owned by the Church or by private landowners; they had been bought and sold in the open market. Michael Sturdza also attempted the secularization of monastic establishments, which was carried out by Prince Cuza in 1864, and the utilization of their endowments for national purposes. He quelled the attempted revolution in 1848 without bloodshed by arresting all the conspirators and expelling them from the country. Under his rule the internal development of Moldavia made immense progress; roads were built, industry developed, and Michael is still gratefully remembered by the people.

See *Michel Stourdza et son administration* (Brussels, 1834); *Michel Stourdza, ancien prince regnant de Moldavie* (Paris, 1874); A. A. C. Sturdza, *Règne de Michel Sturdza, prince de Moldavie 1834–1849* (Paris, 1907).

2. Gregory [Grigorie] Sturdza (1821–1901), son of the above, was educated in France and Germany, became a general in the Ottoman army under the name of Muklis Pasha, and afterwards attained the same rank in the Moldavian army. He was a candidate for the Moldavian throne in 1859, and subsequently a prominent member of the Russophil party in the Rumanian parliament. He wrote *Lois fondamentales de l'univers* (Paris 1891).

3. John [Ioan] Sturdza, prince of Moldavia (1822–1828), was the most famous descendant of Alexander Sturdza. Immediately after the Greek revolution, Prince John Sturdza took an active part in subduing the roving bands of Greek Hetairists in Moldavia; he transformed the Greek elementary schools into Rumanian schools and laid the foundation for that scientific national development which Prince Michael Sturdza continued after 1834. In 1828 the Russians entered the country and took Prince John prisoner. He died in exile.

4. Alexander [Alexandru] Sturdza (1791–1854), Russian publicist and diplomatist, was a member of the same family, born in Bessarabia and educated in Germany. After entering the Russian diplomatic service, he wrote *Betrachtungen über die Lehre und den Geist der orthodoxen Kirche* (Leipzig, 1817). His *Mémoire sur l'état actuel de l'Allemagne*, written at the request of the tsar during the congress of Aix-la-Chapelle, was an attack on the German universities, repeated in *Coup d'œil sur les universités de l'Allemagne* (Aix, 1818). His other important works are *La Grèce en 1821* (Leipzig, 1822) and *Œuvres posthumes religieuses, historiques, philosophiques et littéraires* (5 vols., Paris, 1858–1861).

5. Demetrius [Dimitrie] Sturdza, Rumanian statesman, was born in 1833 at Jassy, and educated there at the Academia Michaileana. He continued his studies in Germany, took part in the political movements of the time, and was private secretary to Prince Cuza. Demetrius afterwards turned against Cuza, joined John Bratianu, and became a member of the so-called Liberal government. In 1899 he was elected leader of the party in succession to Bratianu and was four times prime minister (see Rumania: *History*). Though a man of great capacity for work, he represented the narrowest nationalism, and through his enmity to all that was "alien" did more than any other man to retard the political and industrial development of the country. He was appointed permanent secretary of the Rumanian Academy, and became a recognized authority on Rumanian numismatics. As secretary of the academy he was instrumental in assisting the publication of the collections of historic documents made by Hurmuzaki (30 vols., Bucharest, 1876–1897), and other acts and documents (Bucharest, 1900 sqq.), besides a number of minor political pamphlets of transitory value. (M. G.)

STURE, an ancient patrician family of Sweden, the most notable members of which were the following:—

1. Sten Gustafsson, commonly called Sten Sture the Elder (1440–1503). In 1464 he came prominently forward in support of Bishop Kettil Karlsson Vasa in his struggle against Christian I. of Denmark, and showed great ability in winning over the peasants and making soldiers of them. In 1470 we find him in the forefront of the Swedish national leaders and victorious over both Erik Karlsson Vasa and King Christian himself. After the death of Karl Knutsson, commonly called Charles VIII., Sture was elected regent of Sweden, and from 1470 to 1497 displayed some

of the highest qualities of a statesman. In 1471 he again defeated Christian I. at the great battle of Brunkebjärg which materially strengthened his position in Sweden. In 1483 he was obliged to acknowledge Hans of Denmark and Norway as king; but the strife of factions enabled him to hold his own till the arrival of Hans in Sweden in 1497. His position had in the meantime been weakened by a ruinous war with Russia. He succeeded, however, in annexing Öland to Sweden. After the terrible defeat of Hans by the Dithmarschers in 1500 Sture was a second time elected regent, holding that office till his death.

2. Svante Sture (d. 1512) is mentioned as a senator in 1482. He was one of the magnates who facilitated King Hans's conquest of Sweden by his opposition to Sten Sture the Elder. Subsequently, however, he was reconciled to the latter and succeeded him as regent. He was by no means so imposing a figure as his predecessor, though, like him, Svante in his later years patriotically resisted the Danish claim of sovereignty. He died suddenly at Vesterås Castle.

3. Sten Sture, commonly called Sten Sture the Younger (1492–1520), the son of Svante. After his father's death he was elected regent by the majority of the lesser gentry to the exclusion of the candidate of the high aristocratic faction, Erik Trolle, whence the inextinguishable hatred of the two families. In 1513 the aged archbishop of Upsala, Jakob Ulfsson, resigned in favour of Gustaf Trolle, son of Erik Trolle, who was elected by the cathedral chapter and recommended to the pope by the regent on condition that the new archbishop should do him homage. Unfortunately these two masterful young men (Trolle was twenty-seven, Sture barely twenty-three), who represented respectively the highest ecclesiastical and the highest civil authority in Sweden, were only too prone to carry on the family feud. On the return of Trolle from Rome he refused to do homage to the regent till all his enemies had been punished, and allied himself with Christian II. of Denmark, who hastened to the archbishop's assistance when Sture besieged Trolle in his stronghold at Stäke (1516). Nevertheless Sture not only defeated Christian II. at Vedla, but took and razed Stäke to the ground, and shut up the archbishop in a monastery at Vesterås. A *riksmöte*, or national assembly, held at Stockholm in 1517, declared unanimously that Sweden would never recognize Trolle as archbishop because he had defied the regent and brought the enemy into the land. The war with Denmark was then vigorously resumed. On Midsummer Day 1518 Christian II. appeared before Stockholm with his fleet and landed an army, but was again defeated by Sten Sture at Bränkyrka. An attempt of the papal legate Arcimboldus to mediate between the two countries at Arboga (Dec. 1518) failed. In 1520 Christian, with a regular army, and armed with a papal bull excommunicating Sture, again invaded Sweden. The armies clashed near Börgerund on Lake Aarunden (Jan. 19). At the very beginning Sture was hit by a bullet and his peasant levies fled to the wild mountainous regions of Tiveden where they made a last desperate but unsuccessful stand. The mortally-wounded regent took to his sledge and posted towards Stockholm, but expired on the ice of Lake Mälar two days later, in his 27th year.

See *Sveriges historia*, vol. i. (Stockholm, 1877–1878); K. O. Arnoldson, *Nordens Enhet och Kristian* II. (Stockholm, 1899). (R. N. B.)

STURGE, JOSEPH (1793–1859), English philanthropist and politician, was the son of a farmer in Gloucestershire. He was a member of the Society of Friends, and refused, in his business as a corn factor, to deal in grain used in the manufacture of spirits. He went to Birmingham in 1822, where he became an alderman in 1835. He was an active member of the Anti-Slavery Society, and made a tour in the West Indies, publishing on his return an account of slavery as he there saw it in *The West Indies in 1837* (London, 1837). After the abolition of slavery, to which, as Lord Brougham acknowledged in the House of Lords, he had largely contributed, Sturge started and generously supported schemes for benefiting the liberated negroes. In 1841 he travelled in the United States with the poet Whittier to examine the slavery question there. On his return to England he gave his support to the Chartist movement, and in 1842 was candidate for Nottingham, but was defeated by John Walter, the proprietor of *The Times*. He then took up the cause of peace and arbitration, to support which he was influential in the founding of the *Morning Star* in 1855. The extreme narrowness of Sturge's views was shown in his opposition to the building of the Birmingham town-hall on account of his conscientious objection to the performance of sacred oratorio. He died at Birmingham on the 14th of May 1859. He married, first, in 1834, Eliza, daughter of James Cropper; and, secondly, in 1846, Hannah, daughter of Barnard Dickinson.

See Henry Richard, *Memoirs of Joseph Sturge* (London, 1864); John (Viscount) Morley, *Life of Richard Cobden* (London, 1881).

STURGEON (*Acipenser*), the name given to a small group of fishes, of which some twenty different species are known, from European, Asiatic and North American rivers. The distinguishing characters of this group, as well as its position in the system, are dealt with in the article Teleostomes. They pass a great part of the year in the sea, but periodically ascend large rivers, some in spring to deposit their spawn, others later in the season for some purpose unknown; only a few of the species are exclusively confined to fresh water. None occur in the tropics or in the southern hemisphere.

Sturgeons are found in the greatest abundance in the rivers of southern Russia, more than ten thousand fish being sometimes caught at a single fishing-station in the fortnight during which the up-stream migration lasts. They occur in less abundance in the fresh waters of North America, where the majority are caught in shallow portions of the shores of the great lakes. In Russia the fisheries are of immense value. Early in summer the fish migrate into the rivers or towards the shores of freshwater lakes in large shoals for breeding purposes. The ova are very small, and so numerous that one female has been calculated to produce about three millions in one season. The ova of some species have been observed to hatch within a very few days after exclusion. Probably the growth of the young is very rapid, but we do not know how long the fry remain in fresh water before their first migration to the sea. After they have attained maturity their growth appears to be much slower, although continuing for many years. Frederick the Great placed a number of them in the Görland Lake in Pomerania about 1780; some of these were found to be still alive in 1866. Professor von Baer also states, as the result of direct observations made in Russia, that the Hausen (*Acipenser huso*) attains to an age of from 200 to 300 years. Sturgeons ranging from 8 to 11 ft. in length are by no means scarce, and some species grow to a much larger size.

Sturgeons are ground-feeders. With their projecting wedge-shaped snout they stir up the soft bottom, and by means of their sensitive barbels detect shells, crustaceans and small fishes, on which they feed. Being destitute of teeth, they are unable to seize larger prey.

In countries like England, where few sturgeons are caught, the fish is consumed fresh, the flesh being firmer than that of ordinary fishes, well flavoured, though somewhat oily. The sturgeon is included as a royal fish in an act of King Edward II., although it probably but rarely graces the royal table of the present period, or even that of the lord mayor of London, who can claim all sturgeons caught in the Thames above London Bridge. Where sturgeons are caught in large quantities, as on the rivers of southern Russia and on the great lakes of North America, their flesh is dried, smoked or salted. The ovaries, which are of large size, are prepared for caviare; for this purpose they are beaten with switches, and then pressed through sieves, leaving the membranous and fibrous tissues in the sieve, whilst the eggs are collected in a tub. The quantity of salt added to them before they are finally packed varies with the season, scarcely any being used at the beginning of winter. Finally, one of the best sorts of isinglass is manufactured from the air-bladder. After it has been carefully removed from the body, it is washed in hot water, and cut open in its whole length, to separate the inner membrane, which has a soft consistency, and contains 70% of glutin.

The twenty species of sturgeons (*Acipenser*) are nearly equally divided between the Old and New Worlds. The more important are the following:—

1. The common sturgeon of Europe (*Acipenser sturio*) occurs on all the coasts of Europe, but is absent in the Black Sea. Almost all the British specimens of sturgeon belong to this species; it crosses the Atlantic and is not rare on the coasts of North America. It reaches a large size (a length of 12 ft.), but is always caught singly or in pairs, so that it cannot be regarded as a fish of commercial importance. The form of its snout varies with age (as in the other species), being much more blunt and abbreviated in old than in young examples. There are 11–13 bony shields along the back and 29–31 along the side of the body.

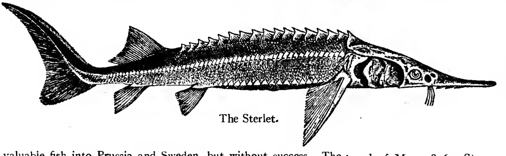
2. *Acipenser güldenstädtii* is one of the most valuable species of the rivers of Russia, where it is known under the name "Ossétr"; it is said to inhabit the Siberian rivers also, and to range eastwards as far as Lake Baikal. It attains to the same large size as the common sturgeon, and is so abundant in the rivers of the Black and Caspian seas that more than one-fourth of the caviare and isinglass manufactured in Russia is derived from this species.

3. *Acipenser stellatus*, the "Seuruga" of the Russians, occurs likewise in great abundance in the rivers of the Black Sea and of the Sea of Azoff. It has a remarkably long and pointed snout, like the sterlet, but simple barbels without fringes. Though growing only to about half the size of the preceding species, it is of no less value, its flesh being more highly esteemed, and its caviare and isinglass fetching a higher price. In 1850 it was reported that more than a million of this sturgeon are caught annually.

4. The sturgeon of the great lakes of North America, *Acipenser rubicundus*, with which, in the opinion of American ichthyologists, the sea-going sturgeon of the rivers of eastern North America, *Acipenser maculosus*, is identical, has of late years been made the object of a large and profitable industry at various places on Lakes Michigan and Erie; the flesh is smoked after being cut into strips and after a slight pickling in brine; the thin portions and offal are boiled down for oil; nearly all the caviare is shipped to Europe. One firm alone uses from ten to eighteen thousand sturgeons a year, averaging 50 ℔ each. The sturgeons of the lakes are unable to migrate to the sea, whilst those below the Falls of Niagara are great wanderers; and it is quite possible that a specimen of this species said to have been obtained from the Firth of Tay was really captured on the coast of Scotland.

5. *Acipenser huso*, the "Hausen" of Germany, is recognized by the absence of osseous scutes on the snout and by its flattened, tape-like barbels. It is one of the largest species, reaching the enormous length of 24 ft. and a weight of 2000 ℔. It inhabits the Caspian and Black seas, and the Sea of Azoff, whence in former years large shoals of the fish entered the large rivers of Russia and the Danube. But its numbers have been much thinned, and specimens of 1200 ℔ in weight have now become scarce. Its flesh, caviare and air-bladder are of less value than those of the smaller kinds.

6. The sterlet (*Acipenser ruthenus*) is one of the smaller species, which likewise inhabits both the Black and Caspian seas, and ascends rivers to a greater distance from the sea than any of the other sturgeons; thus, for instance, it is not uncommon in the Danube at Vienna, but specimens have been caught as high up as Ratisbon and Ulm. It is more abundant in the rivers of Russia, where it is held in high esteem on account of its excellent flesh, contributing also to the best kinds of caviare and isinglass. As early as the 18th century attempts were made to introduce this valuable fish into Prussia and Sweden, but without success. The sterlet is distinguished from the other European species by its long and narrow snout and fringed barbels. It rarely exceeds a length of 3 ft.



The Sterlet.

The family Acipenseridae includes one other genus, *Scaphirhynchus*, the shovel-head or shovel-nosed sturgeon, distinguished by the long, broad and flat snout, the suppression of the spiracles, and the union of the longitudinal rows of scales posteriorly. All the species are confined to fresh water. One of them is common in the Mississippi and other rivers of North America, the other three occur in the larger rivers of eastern Asia.

STURGIS, RUSSELL (1836–1909), American architect and art critic, was born in Baltimore county, Maryland, on the 16th of October 1836. He graduated from the Free Academy in New York (now the College of the City of New York) in 1856, and studied architecture under Leopold Eidlitz and then for two years in Munich. In 1862 he returned to the United States. He designed the Yale University chapel and the Farnham and Durfee dormitories at Yale, the Flower Hospital, the Farmers' and Mechanics' Bank of Albany, and many other buildings, but did comparatively little professional work after 1880. He was in Europe in 1880–1884; and for a short time after his return was secretary of the New York Municipal Civil Service Board. He was president of the Architectural League of New York in 1889–1893, was first president of the Fine Arts Federation in 1895–1897, and was a member of the National Society of Mural Painters, the National Sculpture Society, the National Academy of Design, and the New York chapter of the American Institute of Architects. He lectured on art at Columbia University, the Metropolitan Museum of Art in New York, the Peabody Institute of Baltimore and the Art Institute of Chicago; his lectures in Chicago being published under the title *The Interdependence of the Arts of Design* (1905). He is best known as a writer on art and architecture. He edited *A Dictionary of Architecture and Building* (3 vols., 1901–1902) and the English version of Wilhelm Luebke's *Outlines of the History of Art* (2 vols., 1904), and he wrote *European Architecture* (1896), *How to Judge Architecture* (1903), *The Appreciation of Sculpture* (1904), *The Appreciation of Pictures* (1905), *A Study of the Artist's Way of Working in the Various Handicrafts and Arts of Design* (2 vols., 1905), and an unfinished *History of Architecture* (1906 sqq.). During his last years he was nearly blind. He died in New York on the 11th of February 1909.

STURM, JACQUES CHARLES FRANÇOIS (1803–1855), French mathematician, of German extraction, was born at Geneva on the 29th of September 1803. Originally tutor to the son of Mme de Staël, he resolved, with his schoolfellow Colladon, to try his fortune in Paris, and obtained employment on the *Bulletin universel*. In 1829 he discovered the theorem, regarding the determination of the number of real roots of a numerical equation included between given limits, which bears his name (see EQUATION, V.), and in the following year he was appointed professor of mathematics at the Collège Rollin. He was chosen a member of the Académie des Sciences in 1836, became "répétiteur" in 1838, and in 1840 professor in the École Polytechnique, and finally succeeded S. D. Poisson in the chair of mechanics in the Faculté des Sciences at Paris. His works, *Cours d'analyse de l'école polytechnique* (1857–1863) and *Cours de mécanique de l'école polytechnique* (1861), were published after his death at Paris on the 18th of December 1855.

STURM, JULIUS (1816–1896), German poet, was born at Köstritz in the principality of Reuss on the 21st of July 1816. He studied theology at Jena from 1837 to 1841, and was appointed preceptor to the hereditary prince Henry XIV. of Reuss. In 1851 he became pastor of Göschitz near Schleiz, and in 1857 at his native village of Köstritz. In 1885 he retired with the title of *Geheimkirchenrat*. He died at Leipzig on the 2nd of May 1896. Sturm was a writer of lyrics and sonnets and of church poetry, breathing a spirit of deep piety and patriotism.

His religious poems were published in *Fromme Lieder* (pt. i., Leipzig, 1852; 12th ed., 1893; pt. ii., 1858; pt. iii., 1892), *Zwei Rosen, oder das hohe Lied der Liebe* (Leipzig, 1854; 2nd ed., 1892), *Israelitische Lieder* (3rd ed., Halle, 1881) and *Palme und Krone* (Leipzig, 1888). His chief lyrics were issued in *Gedichte* (6th ed., Leipzig, 1892), *Neue Gedichte* (2nd ed., Leipzig, 1880), *Lieder und Bilder* (2nd ed., 1892), *Kampf- und Siegergedichte* (Halle, 1870), *Neue Lieder* (1880, 2nd ed., 1888), *Neue lyrische Gedichte* (Leipzig, 1894) and *In Freud und Leid, letzte Lieder* (1896).

See A. Hepding, *Julius Sturm* (Giessen, 1896); F. Hoffmann, *Julius Sturm* (Hamburg, 1898).

STURM VON STURMECK, JACOB (1489–1553), German statesman and reformer, was born at Strassburg, where his father, Martin Sturm, was a person of some importance, on the 10th of August 1489. He was educated at the universities of Heidelberg and Freiburg, and about 1517 he entered the service of Henry, provost of Strassburg (d. 1552), a member of the Wittelsbach family. He soon became an adherent of the reformed doctrines, and leaving the service of the provost became a member of the governing body of his native city in 1524. He was responsible for the policy of Strassburg during the Peasants' War; represented the city at the Diet of Spires in 1526; and at subsequent Diets gained fame by his ardent championship of its interests. As an advocate of union among the Protestants he took part in the conference at Marburg in 1529; but when the attempts to close the breach between Lutherans and Zwinglians failed, he presented the *Confessio tetrapolitana*, a Zwinglian document, to the Augsburg Diet of 1530. As the representative of Strassburg Sturm signed the "protest" which was presented to the Diet of Spires in 1529, being thus one of the original "Protestants." He was on friendly terms with Philip, landgrave of Hesse. Owing largely to his influence Strassburg joined the league of Schmalkalden in 1531. The troops of Strassburg took the field when the league attacked Charles V. in 1546; but in February 1547 the citizens were compelled to submit, when Sturm succeeded in securing very favourable terms from the emperor. He was also able to obtain for his native city some modification of the *Interim* issued from Augsburg in May 1548. Sturm is said to have been in the pay of Francis I. of France, but this seems very unlikely. He founded the *Bibliothek* and a gymnasium in Strassburg, where he died on the 30th of October 1553.

Winckelmann, "Jakob Sturm," in the *Allgemeine deutsche Biographie*, Bd. xxxvii. (Leipzig, 1894); and Johannes Sturm, *Consolatio ad senatum argentinensem de morte . . . Jacobi Sturmii* (Strassburg, 1553).

STURT, CHARLES (d. 1869), English explorer in New South Wales and in South Australia, was born in England, and entered the army, reaching the rank of captain. Having landed in Australia with his regiment (the 39th), he became interested in the geographical problems which were exciting attention. A first expedition (1828) led to the discovery of the Darling river; and a second, from which the explorer returned almost blind, made known the existence of Lake Alexandrina. From his third journey (1844–1845), in which terrible hardships had to be endured, he returned quite blind, and he never altogether recovered his sight. He was appointed surveyor-general of South Australia in 1833, and subsequently chief secretary, which position he held until 1856 when responsible government was introduced, and Captain Sturt retired on a pension and went to live at Cheltenham, England, where he died on the 16th of June 1869, before he could be invested with the dignity of K.C.M.G. to which he had been designated.

STUTTGART, a city of Germany, capital of the kingdom of Württemberg. It lies in a basin watered by the Nesenbach just above its confluence with the Neckar, 115 m. N.W. from Munich, and at the centre of a network of railways placing it in direct communication with all the principal towns of south Germany. Pop. (1905), 249,443, of whom about one-half reside in the suburbs of Cannstatt, Berg, Gaisburg, Gablenburg and others. Charmingly situated among vine-clad and wooded hills, Stuttgart stands at a height of nearly 900 ft. above the sea and enjoys a healthy climate. It is intersected from south-west to north-east by the long and handsome Königsstrasse, dividing it into an upper and a lower town. In all its main features it is essentially a modern town, and few of its principal buildings are older than the 19th century. Many of them, however, are of considerable architectural importance and the revival of the Renaissance style is perhaps illustrated nowhere better than in Stuttgart. The lower, or south-eastern, part contains both the small group of streets belonging to old Stuttgart, and also the most important part of the new town. Of the numerous churches in the city the most interesting are the Stiftskirche, with two towers, a fine specimen of 15th-century Gothic; the Leonhardskirche, also a Gothic building of the 15th century; the Hospitalkirche, restored in 1841, the cloisters of which contain the tomb of Johann Reuchlin; the fine modern Gothic church of St John; the new Roman Catholic church of St Nicholas; the Friedenskirche; and the English church. A large proportion of the most prominent buildings are clustered round the spacious Schlossplatz, with its fine promenades. Among these are the new palace, an imposing structure of the 18th century, finished in 1807; the old palace, a 16th-century building, with a picturesque arcaded court; the Königsbau, a huge modern building with a fine colonnade, containing ball and concert rooms; the so-called Akademie, formerly the seat of the Karlschule, where Schiller received part of his education, and now containing the royal library; and the court theatre, destroyed by fire in 1902, and subsequently rebuilt. In the centre of the Schlossplatz is the lofty jubilee column, erected in 1841 in memory of the king of Württemberg, William I., and in the courtyard of the old palace is a bronze equestrian statue of Duke Eberhard the Bearded. On or near the Schlossplatz also are the new courts of justice; the Wilhelmspalast and the palace of the crown prince; the large royal stables; the new post office; and the central railway station, one of the handsomest structures of the kind in Germany. The city contains a fine statue of Schiller, designed by Thorvaldsen; a bronze statue of Christopher, duke of Württemberg; a monument to the emperor William I.; an equestrian statue of King William I. in the court of the museum of the plastic arts; and a large monumental fountain in the Eugensplatte. Other prominent buildings are: the Queen Olga buildings, erected in 1893–1895 in the Renaissance style; the national industrial museum (1890–1896) in the late Renaissance style, flanked by two cupola-crowned towers and decorated with medallions of famous Swabians; the magnificent new town-hall; and the railway viaduct across the valley of the Neckar, 740 yds. long.

The art collections of Stuttgart are numerous and valuable. The museum of art comprises a picture gallery, a collection of casts of Thorvaldsen's works and a cabinet of engravings. The royal library contains about 400,000 printed volumes, including one of the largest collections of Bibles in the world, and also about 20,000 MSS., many of great rarity. To these may be added the industrial museum, the cabinet of coins, the museum of natural history, the collection of majolica vases in the new palace, and the Württemberg museum of antiquities. The city also contains numerous excellent educational establishments, although the state university is not here but at Tübingen, and its conservatorium of music has long been renowned. The technical high school, which since 1899 has possessed the right to confer the degree of doctor of engineering, practically enjoys academic status and so do the veterinary high school and the school of art.

Stuttgart is the centre of the publishing trade of south Germany, and it has busy industries in everything connected with the production of books. Its other manufactures include machinery, pianos and other musical instruments, cotton goods, cigars, furniture, leather, paper, colours and chemicals. Its trade also in books, hops, horses, and cloth is considerable, and a large banking and exchange business is done here. The beauty of its situation and its educational advantages attract numerous foreign residents, especially English and American. Stuttgart is the headquarters of the XIII. corps of the German army, and contains a fairly large garrison for which accommodation is provided in the extensive barracks in and around the city.

To the north-east of the new palace lies the beautiful palace park, embellished with statuary and artificial sheets of water, and extending nearly all the way to Cannstatt, a distance of over two miles. Cannstatt, which was incorporated with Stuttgart in 1903, attracts numerous visitors owing to its beautiful situation on the Neckar and its saline and chalybeate springs. In the environs of Stuttgart and Cannstatt lie Rosenstein, Wilhelma and other residences of the royal family of Württemberg.

Stuttgart seems to have originated in a stud (Stuten Garten) of the early counts of Württemberg, and is first mentioned in a document of 1229. Its importance, however, is of comparatively modern growth and in the early history of Württemberg it was overshadowed by Cannstatt, the central situation of which on the Neckar seemed to mark it out as the natural capital of the country. After the destruction of the castle of Württemberg early in the 14th century, Count Eberhard transferred his residence to Stuttgart, which about 1500 became the recognized capital of Württemberg. But even as capital its growth was slow. At the beginning of the 19th century it did not contain 20,000 inhabitants, and its real advance began with the reigns of Kings Frederick and William I., who exerted themselves in every way to improve and beautify it. In 1849 Stuttgart was the place of meeting of the assembly called the *Rumpfparlament.*

STUYVESANT, PETER (1592–1672), Dutch colonial governor, was born in Scherpenzeel, in southern Friesland, in 1592, the son of a minister. He studied at Franeker, entered the military service in the West Indies about 1625, and was director of the West India Company's colony of Curaçao from 1634 to 1644. In April 1644 he attacked the Portuguese island of Saint Martin and was wounded; he had to return to Holland, and there one of his legs was amputated. Thereafter he wore a wooden leg ornamented with silver bands. In May 1645 he was selected by the West India Company to supersede William Kieft as director of New Netherland. He arrived in New Amsterdam (later New York) on the 11th of May 1647, and was received with great enthusiasm. In response to the demand for self-government, in September 1647 he and the council appointed—after the manner then followed in Holland—from eighteen representatives chosen by the people a board of nine to confer with him and the council whenever he thought it expedient to ask their advice; three of the nine, selected in rotation, were permitted to sit with the council during the trial of civil cases; and six were to retire each year, their successors to be chosen by the director and council from twelve candidates nominated by the board. The leading burghers were, however, soon alienated by his violent and despotic methods, by his defence of Kieft, and by his devotion to the interests of the company; the nine men became (as early as 1649, when they sent the famous *Vertoogh*, or Remonstrance, to the states-general asking for burgher government and other reforms) the centre of municipal discontent; and a bitter quarrel ensued. In 1650 the states-general suggested a representative government to go into effect in 1653, but the company opposed it; in 1653, however, there was established the first municipal government for the city of New Amsterdam modelled after that of the cities of Holland. Stuyvesant also aroused opposition through his efforts to increase the revenues of the company, to improve the system of defence, and to prevent the sale of liquor and firearms to the Indians, and through his persecution of Lutherans and Quakers, to which the company finally put an end. He had a bitter controversy with the patroon of Rensselaerwyck, who claimed to be independent of the West India Company. In 1647 he seized a Dutch ship illegally trading at New Haven and claimed jurisdiction as far as Cape Cod; the New Haven authorities refused to deliver to him fugitives from justice in Manhattan, he retaliated by offering refuge to runaways from New Haven; but finally he offered pardon to the Dutch fugitives and revoked his proclamation. In September 1650 he came to an agreement with the commissioners of the United Colonies of New England at Hartford upon the boundary between New Netherland and Connecticut, involving the sacrifice of a large amount of territory, the new boundary crossing Long Island from the west side of Oyster Bay to the Atlantic Ocean, and on the mainland north from a point west of Greenwich Bay, 4 m. from Stamford. On Long Island, during Stuyvesant's rule, Dutch influence was gradually undermined by John Underhill. Stuyvesant's dealings with the Swedes were more successful. With a force of seven hundred men he sailed into the Delaware in 1655, captured Fort Casimir (Newcastle)—which Stuyvesant had built in 1651 and which the Swedes had taken in 1654—and overthrew the Swedish authority in that region. He also vigorously suppressed Indian uprisings in 1655, 1658 and 1663. In March 1664 Charles II. granted to his brother, the duke of York, the territory between the Connecticut river and Delaware Bay, and Colonel Richard Nicolls with a fleet of four ships and about three or four hundred men was sent out to take possession. Misled by instructions from Holland that the expedition was directed wholly against New England, Stuyvesant made no preparation for defence until just before the fleet arrived. As the burghers refused to support him, Stuyvesant was compelled to surrender the town and fort on the 8th of September. He returned to Holland in 1665 and was made a scapegoat by the West India Company for all its failings in New Amsterdam; he went back to New York again after the treaty of Breda in 1667, having secured the right of free trade between Holland and New York. He spent the remainder of his life on his farm called the Bouwerie, from which the present " Bowery " in New York City takes its name. He died in February 1672, and was buried in a chapel, on the site of which in 1799 was erected St Mark's Church.

See Bayard Tuckerman, *Peter Stuyvesant* (New York, 1893), in the " Makers of America " Series; and Mrs Schuyler Van Rensselaer, *History of the City of New York in the Seventeenth Century* (2 vols., New York, 1909).

STY, an enclosed place or pen to keep pigs in. The word means properly a pen or enclosure for any domestic animal, as is seen from its occurrence in Scandinavian languages and in German, *e.g.* Swed. and Icel. *stia*, pen, *gåsstia*, goose-pen, *swinstia*, pig-sty, Ger. *Steige*, hen-coop, *Schweinsteige*, pig-sty. It is usual to refer the word to *stigan*, to climb, which would connect it with stair and stile and with the Gr. στείχειν. Some take the original meaning to be an enclosure raised on steps, others, in view of the Gr. στοῖχος, row, would take the basic sense to be a row of pales or stakes forming a pen or enclosure; cf. the use of στοῖχος for poles supporting nets to catch game in (Xen. *Cyn.* 6. 10). If the derivation from *stigan* is correct, the word is the same as that meaning a small inflamed swelling, tumour or abscess on the eyelid, the Old English word for which was *stigend*, *i.e.* short for *stigend eáge*, a rising or swelling eye, hence in M. Eng. *styang*, taken as equivalent to "sty on eye."

STYLE (from Gr. στῦλος, a column; a different word from that used in literature, see below), in architecture, the term used to differentiate between its characteristics in various countries and at different periods (see ARCHITECTURE). The derivation of the word suggests that it was at first employed to distinguish the classic styles, in which the column played the chief part, and it would be more appropriate to speak of the Doric and Ionic styles than orders (*q.v.*). In the Assyrian, Sassanian and perhaps the Byzantine styles, the column was a secondary feature of small importance, whereas the Greek, Doric and Ionic styles are based completely on the column and the weight of the superstructure it was required to carry. In France the term is sometimes employed of the individuality of character which is found in an artist's work. For the use of the term " style " in botany see FLOWER.

STYLE, in literature a term which may be defined as language regarded from the point of view of the characteristics which it reveals; similarly, by analogy, in other arts, a mode or method of working characterized by distinctive features. The word (which is different from that used in architecture, see above) is derived from the instrument *stilus* (wrongly spelled *stylus*), of metal, wood or ivory, by means of which, in classic times, letters and words were imprinted upon waxen tablets. By the transition of thought known as metonymy the word has been transferred from the object which makes the impression to the sentences which are impressed by it, and a mechanical observation has become an intellectual conception. To "turn the stylus" was to correct what had been written by the sharp end of the tool, by a judicious application of the blunt end, and this responds to that discipline and self-criticism upon which literary excellence depends. The energy of a deliberate writer would make a firm and full impression when he wielded the stylus. A scribe of rapid and fugitive habit would press more irregularly and produce a less consistent text. The varieties of writing induced by these differences of temperament would reveal the nature of the writer, yet they would be attributed, and with justice, to the implement which immediately produced them. Thus it would be natural for any one who examined several tablets of wax to say, "The writers of these inscriptions are revealed by their stylus"; in other words, the style or impression of the implement is the medium by which the temperament is transferred to the written speech.

If we follow this analogy, the famous phrase of Buffon becomes at once not merely intelligible but luminous—"le style est l'homme même." This axiom is constantly misquoted ("le style c'est l'homme"), and not infrequently miscomprehended. It is usual to interpret it as meaning that the style of a writer is that writer's self, that it reveals the essence of his individuality. That is true, and the statement of it is useful. But it is probably not the meaning, or at least not the original meaning, that Buffon had in mind. It should be recollected that Buffon was a zoologist, and that the phrase occurs in the course of his great *Natural History*. He was considering man in the abstract, and differentiating him from other genera of the animal kingdom. Hence, no doubt, he remarked that "style was man himself," not as every reviewer repeats the sentence to-day, "the man." He meant that style, in the variety and elaboration of it, distinguished the language of man (*Homo sapiens*) from the monotonous roar of the lion or the limited gamut of the bird. Buffon was engaged with biological, not with aesthetic ideas.

Nevertheless, the usual interpretation given to the phrase "le style est l'homme même" may be accepted as true and valuable. According to an Arab legend King Solomon inquired of a djinn, "What is language?" and received the answer, "a wind that passes." "But how," continued the wisest of men, "can it be held?" "By one art only," replied the djinn, "by the art of writing." It may be well to follow a little closely the processes of this art of writing. A human being in the artless condition, in whom, that is to say, the conception of personal expression has not been formed, uses written language to state primitive and general matters of fact. He writes, "The sea is rough to-day; the wind is cold." In these statements there is some observation, but as yet no personal note. We read them without being able to form the very smallest conjecture as to the character or condition of the writer. From these bald and plain words we may rise in degree until we reach Victor Hugo's celebrated parallel of the ocean with the genius of Shakespeare, where every phrase is singular and elaborate, and every element of expression redolent of Victor Hugo, but of no other person who ever lived. Another example, in its own way still more striking, is found in comparison of the famous paragraph which occurs in the *Cyrus-Garden* (1658) of Sir Thomas Browne. A primitive person would say, "But it is time to go to bed"; this statement is drawn out by Browne into the wonderful page beginning, "But the quincunx of Heaven runs low," and collects around it as it proceeds on its voluptuous course the five ports of knowledge, cables of cobwebs, the bed of Cleopatra, the ghost of a rose, the huntsmen of Persia, and a dozen other examples of prolific and ornamented style. In its final form it is so fully characteristic of its author that it may be justly said that the passage *is* Browne himself.

It follows from what has just been said that style appeals exclusively to those who read with attention and for the pleasure of reading. It is not even perceived by those who read primarily for information, and these form the great majority of readers. Even these have a glimmering impression that we must not live by bread alone; that the human heart, with its imagination, its curiosity and sensitiveness, cannot be satisfied by bald statements of fact delivered on the printed page as messages are shouted along the telephone. This instinct it is which renders the untaught liable to fall into those errors of false style to which we shall presently call attention. In the untrained there yet exists a craving for beauty, and the misfortune is that this craving is too easily met by gaudy rhetoric and vain repetitions. The effect on the nature of a human being which is produced by reading or listening to a book, or a passage from a book, which that being greatly admires, is often so violent as to resemble a physical shock to the nerves. It causes a spasm of emotion, which is betrayed by tears or laughter or a heightened pulse. This effect could not be produced by a statement of the fact conveyed in language, but is the result of the manner in which that fact is presented. In other words, it is the style which appeals so vividly to the physical and moral system of the reader—not the fact, but the ornament of the fact. That this emotion may be, and often is, caused by bad style, by the mere tinsel of rhetoric and jangle of alliteration, is not to the point The important matter is that it is caused by style, whether good or bad. Those juvenile ardours and audacities of expression which so often amuse the wise man and exasperate the pedant are but the effects of style acting on a fervid and unripe imagination. The deep delight with which a grown man of experience reads Milton or Dante is but the same phenomenon produced in different conditions.

It is, however, desirable at the outset of an inquiry into the elements of style to insist on the dangers of a heresy which found audacious expression towards the close of the 19th century, namely, that style is superior to thought and independent of it. Against this may be set at once another of the splendid apothegms of Buffon, "Les idées seules forment le fond du style." Before there can be style, therefore, there must be thought, clearness of knowledge, precise experience, sanity of reasoning power. It is difficult to allow that there can be style where there is no thought, the beauty even of some poems, the sequence of words in which is intentionally devoid of meaning, being preserved by the characteristics of the metre, the rhymes, the assonances, all which are, in their degree, intellectual in character. A confusion between form and matter has often confused this branch of our theme. Even Flaubert, than whom no man ever gave closer attention to the question of style, seems to dislocate them. For him the *form* was the work itself: "As in living creatures, the blood, nourishing the body, determines its very contour and external aspect, just so, to his mind, the *matter*, the basis, is a work of art, imposed, necessarily, the unique, the just expression, the measure, the rhythm, the *form* in all its characteristics." This ingenious definition seems to strain language beyond its natural limits. If the adventures of an ordinary young man in Paris be the *matter* of *L'Éducation sentimentale* it is not easy to admit that they "imposed, necessarily," such a "unique" treatment of them as Flaubert so superlatively gave. They might have been recounted with feebler rhythm by an inferior novelist, with bad rhythm by a bad novelist and with no rhythm at all by a police-news reporter. What makes that book a masterpiece is not the basis of adventure, but the superstructure of expression. The expression, however, could not have been built up on no basis at all, and would have fallen short of Flaubert's aim if it had risen on an inadequate basis. The perfect union is that between adequate matter and an adequate form. We will borrow from the history of English literature an example which may serve to illuminate this point. Locke has no appreciable style; he has only thoughts. Berkeley has thoughts which are as valuable as those of Locke, and he has an exquisite style as well. From the artist's point of view, therefore, we are justified in giving the higher place to Berkeley, but in doing this we must not deny the importance of Locke. If we compare him with some pseudo-philosopher, whose style is highly ornamental but whose thoughts are valueless, we see that Locke greatly prevails. Yet we need not pretend that he rises to an equal height with Berkeley, in whom the basis is no less solid, and where the superstructure of style adds an emotional and aesthetic importance to which Locke's plain speech is a stranger. At the same time, an abstract style, such as that of Pascal, may often give extreme pleasure, in spite of its absence of ornament, by its precise and pure definition of ideas and by the just mental impression it supplies of its writer's distinguished vivacity of mind. The abstract or concrete style, moreover, what Rossetti called "fundamental brain-work," must always have a leading place.

When full justice has been done to the necessity of thought as the basis of style, it remains true that what is visible, so to speak, to the naked eye, what can be analysed and described, is an artistic arrangement of words. Language is so used as to awaken impressions of touch, taste, odour and hearing, and these are roused in a way peculiar to the genius of the individual who brings them forth. The personal aspect of style is therefore indispensable, and is not to be ignored even by those who are most rigid in their objection to mere ornament. Ornament in itself is no more style than facts, as such, constitute thought. In an excellent style there is an effect upon our senses of the mental force of the man who employs it. We discover himself in what he writes, as it was excellently said of Châteaubriand that it was into his phrases that he put his heart; again, D'Alembert said of Fontenelle that he had the style of his thought, like all good authors. In the words of Schopenhauer, style is the physiognomy of the soul. All these attempts at epigrammatic definition tend to show the sense that language ought to be, and even unconsciously is, the mental picture of the man who writes.

To attain this, however, the writer must be sincere, original and highly trained. He must be highly trained, because, without the exercise of clearness of knowledge, precise experience and the habit of expression, he will not be able to produce his soul in language. It will, at best, be perceived as through a glass, darkly. Nor can anyone who desires to write consistently and well, afford to neglect the laborious discipline which excellence entails. He must not be satisfied with his first sprightly periods; he must polish them, and then polish them again. He must never rest until he has attained a consummate adaptation of his language to his subject, of his words to his emotion. This is the most difficult aim which the writer can put before him, and it is a light that flits ever onward as he approaches. Perfection is impossible, and yet he must never desist from pursuing perfection. In this connexion the famous tirade of Tamburlaine in Marlowe's tragedy cannot be meditated upon too carefully, for it contains the finest definition which has been given in any language of style as the unapproachable fen-fire of the mind:—

> "If all the pens that poets ever held
> Had fed the feeling of their master's thoughts,
> And every sweetness that inspired their hearts,
> Their minds, and muses, on admirèd themes—
> If all the heavenly quintessence they 'still
> From their immortal flowers of poesy,
> Wherein, as in a mirror, we perceive
> The highest reaches of a human wit—
> If those had made one poem's period,
> And all combined in beauty's worthiness,
> Yet should there hover in our restless heads
> One thought, one grace, one wonder, at the least.
> Which into words no virtue can digest."

Flaubert believed that every thougnt or grace or wonder had one word or phrase exactly adapted to express it, and could be "digested" by no other without loss of clearness and beauty. It was the passion of his life, and the despair of it, to search for this unique phrase in each individual case. Perhaps in this research after style he went too far, losing something of that simplicity and inevitability which is the charm of natural writing. It is boasted by the admirers of Flaubert that his style is an enamel, and those who say this perhaps forget that the beauty of an enamel resides wholly in its surface and not at all in the substance below it. This is the danger which lies in wait for those who consider too exquisitely the value and arrangement of their words. Their style becomes too glossy, too highly varnished, and attracts too much attention to itself. The greatest writing is that which in its magnificent spontaneity carries the reader with it in its flight; that which detains him to admire itself can never rise above the second place. Forgetfulness of self, absence of conceit and affectation, simplicity in the sense not of thinness or poorness but of genuineness—these are elements essential to the cultivation of a noble style. Here again, thought must be the basis, not vanity or the desire to astonish. We do not escape by our ingenuities from the firm principle of Horace, "scribendi *recti sapere* est et principium et fons."

In speaking of originality in style it must not be forgotten that memory exercises a strong and often an insidious effect upon writing. That which has been greatly admired will have a tendency to impregnate the mind, and its echo, or, what is worse, its cadence, will be unconsciously repeated. The *cliché* is the greatest danger which lies in wait for the vapid modern author, who is tempted to adopt, instead of the one fresh form which suits his special thought, a word or even a chain of words, which conventionally represents it. Thus "the devouring element" was once a striking variant for the short word "fire," and a dangerous hidden place was once well described as "a veritable death-trap," but these have long been *clichés* which can only be used by writers who are insincere or languid. Worse than these are continuous phrases, and even sentences, such as are met with in the leaders of daily newspapers, which might be lifted bodily from their places and inserted elsewhere, so completely have they lost all vitality and reality.

With regard to the training which those who wish to write well should resign themselves to undergo, there is some difference of opinion, based upon difference of temperament. There are those who believe that the gift of style is inborn, and will reveal itself at the moment of mental maturity without any external help. There are others who hold that no amount of labour is excessive, if it be directed to a study and an emulation of what are called "the best models." No doubt these theories are both admissible. If a man is not born to write well, no toil in the imitation of Addison or Ruskin will make his style a brilliant one; and a born writer will express himself with exactitude and fire even though he be but an idle student of the classics. Yet, on the other hand, the very large number of persons who have a certain aptitude for writing, yet no strong native gift, will undoubtedly cure themselves of faults and achieve skill and smoothness by the study of those writers who have most kinship with themselves. To be of any service, however, it seems that those writers must have used the same language as their pupils. Of the imitation of the ancients much has been written, even to the extent of the publication of manuals. But what is that imitation of the verse of Homer which leads to-day to Chapman and to-morrow to Pope? What the effect of the study of the prose of Theophrastus which results in the prose of Addison? The good poet or prose-man, however closely he studies an admirable foreign model, is really anxious to say something which has never before been said in his own language. The stimulus which he receives from any foreign predecessor must be in the direction of analogous or parallel effort, not in that of imitation.

The importance of words, indeed, is exemplified, if we regard it closely, in this very question, so constantly mooted, of the imitation of the ancients, by the loss of beauty fatally felt in a bad translation. The vocabulary of a great writer has been, as Pater says, "winnowed"; it is impossible to think of Sophocles or of Horace as using a word which is not the best possible for introduction at that particular point. But the translator has to interpret the ideas of these ancient writers into a vocabulary which is entirely different from theirs, and unless he has a genius of almost equal impeccability he will undo the winnowing work.

He will scatter chaff and refuse over the pure grain which the classic poet's genius had so completely fanned and freed. The employment of vague and loose terms where the original author has been eclectic, and of a flood of verbiage where he has been frugal, destroys all semblance of style, although the meaning may be correctly preserved.

The errors principally to be avoided in the cultivation of a pure style are confusion, obscurity, incorrectness and affectation. To take the earliest of these first, no fault is so likely to be made by an impetuous beginner as a mingling together of ideas, images, propositions which are not on the same plane or have no proper relation. This is that mass of "stunning sounds and voices all confused" which Milton deprecates. One of the first lessons to be learned in the art of good writing is to avoid perplexity and fatigue in the mind of the reader by retaining clearness and order in all the segments of a paragraph, as well as propriety of grammar and metaphor in every phrase. Those who have overcome this initial difficulty, and have learned to avoid a jumble of misrelated thoughts and sentences, may nevertheless sin by falling into obscurity, which, indeed, is sometimes a wilful error and arises from a desire to cover poverty of thought by a semblance of profundity. The meaning of "obscurity" is, of course, in the first instance "darkness," but in speaking of literature it is used of a darkness which arises from unintelligibility, not from depth of expression, but from cloudiness and fogginess of idea.

Of the errors of style which are the consequences of bad taste, it is difficult to speak except in an entirely empirical spirit, because of the absence of any absolute standard of beauty by which artistic products can be judged. That kind of writing which in its own age is extravagantly cultivated and admired may, in the next age, be as violently repudiated; this does not preclude the possibility of its recovering critical if not popular favour. Perhaps the most remarkable instance of this is the revolution made against the cold and stately Ciceronian prose of the middle of the 16th century by the so-called Euphuists. This occurred almost simultaneously in several nations, but has been traced to its sources in the Spanish of Guevara and in his English imitators, North and Pettie, whom Lyly in his turn followed with his celebrated *Euphues.* Along with these may not unfairly be mentioned Montaigne in France and Castiglione in Italy, for, although these men were not proficients in Guevara's artificial manner, his *estilo alto*, still, by their easiness and brightness, their use of vivid imagery and their graceful illumination, they marked the universal revulsion against the Ciceronian stiffness. Each of these new manners of writing fell almost immediately into desuetude, and the precise and classic mode of writing in another form came into vogue (Addison, Bossuet, Vico, Johnson). But what was best in the ornamental writers of the 16th century is now once more fully appreciated, if not indeed admired to excess. A facility in bringing up before the memory incessant analogous metaphors is the property, not merely of certain men, but of certain ages; it flourished in the age of Marino and is welcomed again in that of Meredith. A vivid, concrete style, full of colour and images, is not to be condemned because it is not an abstract style, scholastic and systematic. It is to be judged on its own merits and by its own laws. It may be good or bad; it is not bad merely because it is metaphorical and ornate. The amazing errors which lie strewn along the shore of criticism bear evidence to the lack of sympathy which has not perceived this axiom and has wrecked the credit of dogmatists. To De Quincey, a convinced Ciceronian, the style of Keats "belonged essentially to the vilest collections of waxwork filagree or gilt gingerbread"; but to read such a judgment is to encourage a question whether all discussion of style is not futile. Yet that particular species of affectation which encourages untruth, affectation, parade for the mere purpose of producing an effect, must be wrong, even though Cicero be guilty of it.

The use of the word "style," in the sense of the present remarks, is not entirely modern. For example, the early English critic Puttenham says that "style is a constant and continual phrase or tenour of speaking and writing" (1589). But it was in France and in the great age of Louis XIV. that the art of writing began to be carefully studied and ingeniously described. Mme de Sévigné, herself mistress of a manner exquisitely disposed to reflect her vivacious, tender and eloquent character, is particularly fond of using the word "style" in its modern sense, as the expression of a complete and rich personality. She says, in a phrase which might stand alone as a text on the subject, "Ne quittez jamais le naturel, votre tour s'y est formé, et cela compose un style parfait." Her contemporary, Boileau, contributed much to the study, and spoke with just pride of "mon style, ami de la lumière." The expression to form one's style, *à se faire un style*, appears, perhaps for the first time, in the works of the abbé d'Olivet (1682–1768), who was addicted to rhetorical speculation. Two great supporters of the pure art of writing, Swift and Voltaire, contributed much to the study of style in the 18th century. The former declared that "proper words in proper places make the true definition of a style"; the latter, more particularly, that "le style rend singulières les choses les plus communs, fortifie les plus faibles, donne de la grandeur aux plus simples." Voltaire speaks of "le mélange des styles" as a great fault of the age in which he lived; it has come to be looked upon as a principal merit of that in which we live.

The problem of how to obtain a style has frequently been treated in works of more or less ephemeral character. In France the treatises of M. Albalat have received a certain amount of official recognition, and may be mentioned here as containing a good deal of sound advice mixed with much that is jejune and pedagogic. If M. Albalat distributes a poison, the antidote is supplied by the wit of M. Remy de Gourmont; the one should not be imbibed without the other.

See Walter Pater, *An Essay on Style* (London, 1889); Walter Raleigh, *Style* (London, 1897); Antoine Albalat, *L'Art d'écrire enseigné en vingt leçons* (Paris, 1898), and *De la Formation du style par l'assimilation des auteurs* (Paris, 1901); Remy de Gourmont, *Le Problème du style* (Paris, 1902). Also Goyer-Linguet, *Le Génie de la langue française* (Paris, 1846), and "Loyson-Bridet" (*i.e.* Marcel Schwob), *Moeurs des diurnales* (Paris, 1902), a satire on the principal errors to which modern writers in all languages are liable. (E. G.)

STYLOBATE (Gr. στῦλος, a column, and βάσις, a base), the architectural term given to the upper step of the Greek temple on which the columns rest, and generally applied to the three steps.

STYRIA (German, *Steiermark* or *Steyermark*), a duchy and crownland of Austria, bounded E. by Hungary and Croatia, S. by Carniola, W. by Carinthia and Salzburg, and N. by Upper and Lower Austria. It has an area of 8670 sq. m. Almost all the district is mountainous, and is distinguished by the beauty of its scenery and by its mineral wealth. Geographically it is divided into northern or Upper Styria, and southern or Lower Styria, and is traversed by various ramifications of the eastern Alps. To the north of the Enns are ramifications of the Salzkammergut and Enns Alps, which include the Dachstein (9830 ft.), and the Grimming (7713 ft.), and the groups of the Todtes Gebirge (6890 ft.) and of the Pyrgas with the Grosser Pyrgas (7360 ft.). The last two groups are separated by the Pyhrn Pass (3100 ft.), traversed by a road constructed in the Roman period. Then comes the Buchstein group with the Grosser Buchstein (7294 ft.). This group forms the northern flank of the celebrated Gesäuse, a defile 12 m. long, between Admont and Hieflau, through which the Enns forces its course, forming a series of rapids. The southern flank is formed by the massif of the Reichensteiner Gebirge, which culminates in the Hochthor (7780 ft.) and belongs to the north Styrian Alps, also called Eisenerzer Alps. This group extends east of the Enns, and contains the Erzberg (5000 ft.) celebrated for its iron ores. Other groups of the north Styrian Alps are the Hochschwab, with the highest peak the Hochschwab (7482 ft.) and the Hochveitsch with the Hohe Veitsch (6501 ft.). Then come the Lower Austrian Alps with the groups of the Voralpe (5800 ft.), of the Schneealpe (6245 ft.), and the Raxalpe, with the Heukuppe (6950 ft.). All these mountains belong to the northern zone of the eastern Alps. South of the Enns, Styria is traversed by groups of the central zone of the eastern Alps: the Niedere Tauern, the primitive Alps of Carinthia and Styria and the Styrian Nieder Alps. The principal divisions of the Niedere Tauern are: the Radstädter Tauern with the Hochgolling (9390 ft.), the Wölzer Alps with the Predigtstuhl (8349 ft.), the Rottenmanner Tauern with the Grosser Bösenstein (8032 ft.), and the Seckauer Alps or Zinken group, which culminates in the Zinkenkogel (7865 ft.). The principal ramifications of the primitive Alps of Carinthia and Styria are: the Stang Alps with the Königsstuhl (7646 ft.) and Eisenhut (8007 ft.), the Judenburger or Seethaler Alps with the Zirbitzkogel (7862 ft.), and the Koralpen which culminates in the Grosser Speikkogel (7023 ft.). The Styrian Nieder Alps cover the country north and east of the Mur, and contain the Fischbacher Alps with the Hochlantsch (5646 ft.), the Wechsel group (5700 ft.), and the small Semmering group with the Stuhleck or Spitaler Alpe (5847 ft.), and the Sonnenwendstein (4994 ft.). In this group is the famous Semmering Pass, which leads from Lower Austria into Styria and is crossed by the Semmering railway. This railway, which was completed in 1854, is the oldest of the great continental mountain railways, and is remarkable for its numerous and long tunnels, its viaducts and galleries. It has a length of 35 m., beginning at Gloggnitz in Lower Austria and ending at Mürzzuschlag in Styria, and passes through some exceedingly beautiful scenery. The whole region is now a favourite summer resort. South of the Drave Styria is traversed by the following ramifications of the southern zone of the eastern Alps: the Bacher Gebirge with the Cerni Vrch or Schwarzer Berg (5078 ft.), and the Sannthaler or Steiner Alps with the Oistriza (7709 ft.) and the highest peak of the group, the Grintovc or Grintouz (8429 ft.), which is situated on the threefold boundary of Carinthia, Carniola and Styria. Here is also the mountain country of Cilli, with the highest peak, the Wachberg (3364 ft.). The mountains decrease in height from west to east, and the south-east of Styria may be described as hilly rather than mountainous. This part is occupied by the eastern outliers of the Alps, known as the Styrian hill country, and by the Windisch Büheln, which is one of the most renowned vine districts in the whole of Austria. Styria belongs to the watershed of the Danube and its principal rivers are: the Enns with its affluent the Salza, the Raab with the Feistritz, the Mur with the Mürz, the Drau or Drave, and the Sau or Save, which receives the Sann and the Sotla. Styria has numerous small Alpine lakes of which the most important are the Grundel-see, the Töplitz-see, and the Leopoldsteiner-see. There is a mean annual difference of about 9° F. between the north-west and the south-east. The best known mineral springs are the alkaline springs of Rohitsch and Gleichenberg, the brine springs of Aussee, and the thermal springs of Tüffer, Neuhaus and Tobelbad.

In spite of the irregular nature of the surface, but little of the soil can be called unproductive. Of its total area 47-49% is covered with fine forests. About 19% is arable land, 12% pastures, 5·60% meadows, while 1·06% is occupied by gardens and 1·4% by vineyards which produce wine of a good quality. Cattle-rearing has taken a great development and also dairy-farming in the Alpine fashion. A good race of horses is bred in the valley of the Enns, while poultry-rearing and bee-keeping are carried on in the south. Fish and game are also plentiful. The great wealth of Styria, however, lies underground. Its extensive iron mines, mostly at Erzberg, which were worked during the Roman period, yield nearly half of the total production of iron in Austria. The principal foundries are at Eisenerz, Vordernberg, Trofaiach, Hieflau, Zeltweg and Neuberg. Next in importance comes the mining of brown coal, which has also been carried on for a long time. The richest coalfields are situated near Leoben, near Voitsberg and Köflach, near Eibiswald and Wies, and round Trifail, Tüffer and Hrastnig. Its other mineral resources include graphite, copper, zinc, lead, salt, alum, potter's clay, marble and good mill and building stones. Iron-foundries, machine-shops and manufactures of various kinds of iron and steel goods are very numerous. A special branch is the making of scythes and sickles which are exported in large quantities. Among its other industrial products are glass, paper, cement, cotton goods, chemicals and gunpowder. Linen-weaving is a household industry.

The population of Styria in 1900 was 1,356,058, which is equivalent to 156 inhabitants per square mile. This proportion is considerably above the rate in the other mountainous regions of Austria. Nearly all (98·74%), profess the Roman Catholic faith and are under the bishops of Seckau and of Lavant. The Protestants number only a little over 13,000, while there are about 2500 Jews. Two-thirds of the inhabitants are Germans; the remainder, chiefly found in the valleys of the Drave and Save, are Slavs (Slovenes). At the head of the educational institutions of the province stands the university of Graz. The local Diet, of which the two Roman Catholic bishops and the rector of the university of Graz are members *ex officio*, is composed of 63 members, while Styria sends 27 deputies to the Reichsrat at Vienna. For administrative purposes, the province is divided into 21 districts and 4 towns with autonomous municipalities, namely Graz (pop. 138,370), the capital, Cilli (6743), Marburg (24,501) and Pettau (4227). Other important places are Leoben (10,204), Bruck on the Mur (7527), Mariazell (1263), Mürzzuschlag (4856), Eisenerz (6494), Vordernberg (3111), Judenburg (4901), Trifail (10,851), Eggenberg (9570), Donawitz (13,093), Köflach (3345) and Voitsberg (3321).

In the Roman period Styria, which even thus early was famed for its iron and steel, was inhabited by the Celtic Taurisci, and divided geographically between Noricum and Pannonia. Subsequently it was successively occupied or traversed by Visigoths, Huns, Ostrogoths, Langobardi, Franks and Avars. Towards the end of the 6th century the last-named began to give way to the Slavs, who ultimately made themselves masters of the entire district. Styria was included in the conquests of Charlemagne, and was henceforth comprised in the German marks erected against the Avar and the Slav. At first the identity of Styria is lost in the great duchy of Carinthia, corresponding more or less closely to the Upper Carinthian mark. This duchy, however, afterwards fell to pieces, and a distinct mark of Styria was recognized, taking its name from the margrave Ottacar of Steier (1056). A century or so later it was created a duchy. In 1192 the duchy of Styria came by inheritance to the house of Austria, and from that time it shared the fortunes of Upper and Lower Austria, passing like them to the Habsburgs in 1282. The Protestant Reformation met an early and general welcome in Styria, but the dukes took the most stringent measures to stamp it out, offering their subjects recantation or expatriation as the only alternatives. At least 30,000 Protestants preferred exile, and it was not till the edict of tolerance of 1781 granted by Joseph II. that religious liberty was recognized.

See *Die Österreichisch-ungarische Monarchie in Wort und Bild*, vol. vii. (24 vols., Wien, 1885–1902); A. von Muchar, *Geschichte des Herzogtums Steiermark* (8 vols., Graz, 1844–1867). It treats the history till 1558. F. M. Mayer, *Geschichte der Steiermark mit besonderer Rücksicht auf das Kulturleben* (Graz, 1898); J. von Zahn, *Styriaca* (Graz, 1894–1896).

STYROLENE, $C_6H_5{\cdot}CH{:}CH_2$, also known as phenylethylene or vinylbenzene, an aromatic hydrocarbon found to the extent of 1 to 4% in storax; it also occurs with crude xylene in coal tar fractions. It may be obtained from storax by distillation with water, and synthetically by heating cinnamic acid with lime, by the action of aluminium chloride on a mixture of vinyl bromide and benzene, by removing the elements of hydrobromic acid from bromethylbenzene by means of alcoholic potash, or, best, by treating β-bromhydrocinnamic acid with soda, when it yields styrolene, carbon dioxide and hydrobromic acid. It also results on condensing acetylene, and on reducing phenylacetylene by zinc dust and acetic acid. It is a clear, strongly refractive liquid, which has a pleasant odour; it boils at 144° and has a specific gravity of 0·925 at 0°. Styrolene is oxidized by nitric or chromic acids to benzoic acid; reduction gives ethylbenzene; hydrochloric and hydrobromic acids yield α-haloid ethylbenzenes, *e.g.* $C_6H_5{\cdot}CHCl{\cdot}CH_3$; whilst chlorine and bromine give $\alpha\beta$-dihaloid ethylbenzenes, *e.g.* $C_6H_5{\cdot}CHCl{\cdot}CH_2Cl$.

Styrolene gives origin to three series of derivatives, two of which contain the substituents in the side chain, *e.g.* $C_6H_5 \cdot CCl:CH_2$ or α-compounds, and $C_6H_5 \cdot CH:CHCl$, or ω-compounds, whilst in the third the benzene nucleus is substituted. The α-halogen compounds are obtained by heating styrolene chloride (or bromide) with lime or alcoholic potash; they are liquids which have a penetrating odour, and yield acetophenone when heated with water to 180°. The ω-chlor compound results when β-phenyl-α-chlorlactic acid (from hypochlorous acid and cinnamic acid) is heated with water; it has a hyacinthine odour and yields phenylacetaldehyde when heated with water. Nitrostyrolene results when styrolene is treated with fuming nitric acid.

Related to styrolene is phenylacetylene, $C_6H_5 \cdot C \vdots CH$, which results when α-bromstyrolene or acetophenone chloride are heated to 130° with alcoholic potash, or phenylpropiolic acid with water to 120°. It is a liquid, boiling at 139° and having a pleasant odour. It resembles acetylene in yielding metallic derivatives with ammoniacal copper and silver solutions. On solution in sulphuric acid, followed by dilution with water, it yields acetophenone.

Stilbene or toluylene, $C_6H_5 \cdot CH:CH \cdot C_6H_5$, is symmetrical diphenylethylene. It may be obtained by distilling benzyl sulphide or disulphide, by the action of sodium on benzaldehyde or benzal chloride, by distilling fumaric and cinnamic phenyl esters: $C_6H_5O \cdot OC \cdot CH:CH \cdot CO \cdot OC_6H_5 \rightarrow CO_2 + C_6H_5 \cdot CH:CH \cdot CO \cdot OC_6H_5 \rightarrow 2CO_2 + C_6H_5 \cdot CH:CH \cdot C_6H_5$ (*Ber.*, 18, p. 1945), and from chlor asymmetrical diphenylethane derivatives which undergo a rearrangement when heated (*Ber.*, 7. p. 1409). Stilbene (from Gr. στίλβειν, to glisten) crystallizes in large, colourless, glistening monoclinic plates, which melt at 124° and boil at 306°. On passing the vapour through red-hot tubes it yields anthracene and toluene. Reduction with hydriodic acid gives dibenzyl, and heating with sulphur gives tetraphenylthiophene or thionessal. Many derivatives are known, some of which exist in two structural forms, exhibiting geometrical isomerism after the mode of fumaric and maleic acids. Those substituted in the benzene nucleus are obtained by condensing two molecules of a substituted benzyl and benzal chlorides. The diortho and dipara dinitro compounds result from the action of alcoholic potash on ortho- and para-nitrobenzyl chlorides. The latter on reduction yields a diamino compound, the disulphonic acid of which on diazotization and coupling with a phenol, &c., gives valuable substantive cotton dyes after the type yielded by Benzidine. Stilbene bromide when treated with alcoholic potash gives diphenyl acetylene or tolane, $C_6H_5 \cdot C \vdots C \cdot C_6H_5$.

STYX, in Greek mythology, a river which flowed seven times round the world of the dead. In the *Iliad* it is the only river of the underworld; in the *Odyssey* it is coupled with Cocytus and Pyriphlegethon, which flow into the chief river Acheron. Hesiod says that Styx was a daughter of Ocean, and that, when Zeus summoned the gods to Olympus to help him to fight the Titans, Styx was the first to come and her children with her; hence as a reward Zeus ordained that the most solemn oath of the gods should be by her and that her children (Emulation, Victory, Power and Force) should always live with him. Again, Hesiod tells us that if any god, after pouring a libation of the water of Styx, forswore himself, he had to lie in a trance for a year without speaking or breathing, and that for nine years afterwards he was excluded from the society of the gods. In historical times the Styx was identified with a lofty waterfall near Nonacris in Arcadia. Pausanias (viii. 17, 6) describes the cliff over which the water falls as the highest he had ever seen, and indeed the fall is the highest in Greece. The ancients regarded the water as poisonous, and thought that it possessed the power of breaking or dissolving vessels of every material, with the exception of the hoof of a horse or a mule. Considering the undoubted importance attached by the ancients to an oath by the water of the Styx (cf. Herodotus vi. 74), and the supposed fatal result of breaking it, it is probable that drinking the water originally formed a necessary part of the oath, and that we have to do with the tradition of an ancient poison ordeal, common amongst barbarous peoples (for the geography and similar ceremonies see Frazer's *Pausanias*, iv., pp. 250–255). The people in the neighbourhood, who call it Mavro Neró (the Black Water), still think that it is unwholesome, and that no vessel will hold it.

SUAKIN, or Sawakin, a seaport of the Anglo-Egyptian Sudan on the west side of the Red Sea in 19° 7′ N., 37° 20′ E. Pop. (1905), 10,500. Suakin stands on a coralline islet connected with the suburb of El-Kef on the mainland by a causeway and a viaduct. Access is gained to the harbour through a winding and dangerous passage over 2 m. long, terminating in a deep oval-shaped basin several acres in extent, and completely sheltered from all winds. For centuries the chief port of the eastern Sudan, Suakin has been since 1906 to some extent superseded by Port Sudan (*q.v.*), a harbour 36 m. to the north. The custom-house and government offices present an imposing frontage to the sea, and the principal houses are of white coral stone three storeys high. The mosques are not remarkable. The mainland part of the town is surrounded by a high coral wall, built in 1884 to resist dervish attacks. About a mile beyond is a line of outer forts. The climate is very hot, damp and unhealthy, and in the summer months the government headquarters are removed to Erkowit 35 m. west of Suakin, on a plateau 3000 ft. above the sea.

Suakin is less conveniently situated than some neighbouring points (*e.g.* Port Sudan) for the trade with the Nile Valley. The island is without water and the harbour indifferent; yet the settlement is ancient. Here, as at Massawa, traders were presumably attracted by the advantages of an island site which protected them from the raids of the nomad Arabs of the mainland. The country inland belonged in the middle ages to the Beja (*q.v.*), but the trading places seem to have been always in the hands of foreigners since Ptolemais Theron was established by Ptolemy Philadelphus for intercourse with the elephant hunters. After the rise of Mahommedanism many Arabs settled on the coast and mixed with the heathen Beja, whose rule of kinship and succession in the female line helped to give the children of mixed marriages a leading position (Makrizi, *Khitat*, i. 194 seq., translated in Burckhardt's *Travels in Nubia*, app. iii.). Thus in 1330 Ibn Batuta found a son of the amir of Mecca reigning in Suakin over the Beja, who were his mother's kin. Makrizi says that the chief inhabitants were nominal Moslems and were called Hadarib. The amir of the Hadarib was still sovereign of the mainland at the time of J. L. Burckhardt's visit (1814), though the island had an aga appointed by the Turkish pasha of Jidda. The place was seized in 1517 by the Turks under Selim the Great, but Turkish control did not extend inland. Mehemet Ali after the conquest of the Sudan leased Suakin from Turkey. This lease lapsed with the pasha's death, but in 1865 Ismail Pasha reacquired the port for Egypt. Till the suppression of the slave trade Suakin was an important slave port and it has always been the place of embarcation for Sudan pilgrims to Mecca. Legitimate commerce, rapidly growing before the revolt of the mahdi (1881), was greatly crippled during the continuance of the dervish power, though the town itself never fell into their hands. After the fall of the khalifa trade revived, the imports in 1899 being valued at £180,000, as against £170,000 in 1880. In 1906 the figures were: imports, £324,000; exports, £113,000. Pearl fishing is an important industry and cotton is cultivated in the neighbourhood.

Suakin was the headquarters of the Egyptian and British troops operating in the eastern Sudan against the dervishes under Osman Digna (see Egypt, *Military Operations*, 1884, seq.). When these operations were begun a project for linking Suakin to Berber by railway, first proposed during Ismail's viceroyalty, was revived and a few miles of rails were laid in 1884. Then the Sudan was abandoned and the railway remained in abeyance until 1905–1906, when the line was at length built. The railway has a terminus at Suakin, but Port Sudan was chosen as the principal entrepôt of the commerce carried by the railway. Notwithstanding the rivalry of its newly created neighbour, the trade of Suakin continued to develop. The port is connected by submarine cables with Suez and Aden and with Jidda, which lies 200 m. north-east on the opposite coast of the Red Sea (see Sudan, § *Anglo-Egyptian*).

SUARDI, BARTOLOMMEO (*c.* 1455–*c.* 1536), Italian painter and architect, frequently called Bramantino, was born in Milan, the son of Alberto Suardi. He executed a number of paintings containing portraits of celebrated personages for the Vatican. In 1508 he was engaged in Rome. Bramante d'Urbino taught Bramantino architecture, and the pupil assisted the master in the execution of the interior of the church of San Satiro, Milan. In 1525 Bramantino was appointed architect to the court by Duke Francis (II.) Sforza, and his aid as an engineer in the defence of Milan brought him a multitude of rewards.

Bartolommeo Suardi has been much confused with a certain Bramantino da Milano, of whom Vasari makes frequent and specific mention in his life of Piero della Francesca, his observations on Benvenuto Garofalo and Girolamo da Carpi, and his life of Jacopo Sansovino. The Bramantino of Vasari, if he existed at all, worked for Pope Nicolas V. between 1450 and 1455.

SUAREZ, FRANCISCO (1548–1617), Spanish theologian and philosopher, was born at Granada on the 5th of January 1548, and educated at Salamanca. Influenced by the Jesuit John Ramirez he entered the Society of Jesus in 1564, and after teaching philosophy at Segovia, taught theology at Valladolid, at Alcala, at Salamanca, and at Rome successively. After taking his doctorate at Evora, he was named by Philip II. principal professor of theology at Coimbra. Suarez may be considered almost the last eminent representative of scholasticism. In philosophical doctrine he adhered to a moderate Thomism. On the question of universals he endeavoured to steer a middle course between the pantheistically inclined realism of Duns Scotus and the extreme nominalism of William of Occam. The only veritable and real unity in the world of existences is the individual; to assert that the universal exists separately *ex parte rei* would be to reduce individuals to mere accidents of one indivisible form. Suarez maintains that, though the humanity of Socrates does not differ from that of Plato, yet they do not constitute *realiter* one and the same humanity; there are as many "formal unities" (in this case, humanities) as there are individuals, and these individuals do not constitute a factual, but only an essential or ideal unity ("ita ut plura individua, quae dicuntur esse ejusdem naturae, non sint unum quid vera entitate quae sit in rebus, sed solum fundamentaliter vel per intellectum"). The formal unity, however, is not an arbitrary creation of the mind, but exists "in natura rei ante omnem operationem intellectus." In theology, Suarez attached himself to the doctrine of Luis Molina, the celebrated Jesuit professor of Evora. Molina tried to reconcile the doctrine of predestination with the freedom of the human will by saying that the predestination is consequent upon God's foreknowledge of the free determination of man's will, which is therefore in no way affected by the fact of such predestination. Suarez endeavoured to reconcile this view with the more orthodox doctrines of the efficacy of grace and special election, maintaining that, though all share in an absolutely sufficient grace, there is granted to the elect a grace which is so adapted to their peculiar dispositions and circumstances that they infallibly, though at the same time quite freely, yield themselves to its influence. This mediatizing system was known by the name of "congruism." Suarez is probably more important, however, as a philosophical jurist than as a theologian or metaphysician. In his extensive work *Tractatus de legibus ac deo legislatore* (reprinted, London, 1679) he is to some extent the precursor of Grotius and Samuel Pufendorf. Though his method is throughout scholastic, he covers the same ground, and Grotius speaks of him in terms of high respect. The fundamental position of the work is that all legislative as well as all paternal power is derived from God, and that the authority of every law resolves itself into His. Suarez refutes the patriarchal theory of government and the divine right of kings founded upon it—doctrines popular at that time in England and to some extent on the Continent. Power by its very nature belongs to no one man but to a multitude of men; and the reason is obvious, since all men are born equal. It has been pointed out that this accords well with the Jesuit policy of depreciating the royal while exalting the papal prerogative. But Suarez is much more moderate on this point than a writer like Mariana, approximating to the modern view of the rights of ruler and ruled. In 1613, at the instigation of Pope Paul V., Suarez wrote a treatise dedicated to the Christian princes of Europe, entitled *Defensio catholicae fidei contra anglicanae sectae errores*. This was directed against the oath of allegiance which James I. exacted from his subjects. James caused it to be burned by the common hangman, and forbade its perusal under the severest penalties, complaining bitterly at the same time to Philip III. that he should harbour in his dominions a declared enemy of the throne and majesty of kings. Suarez lived a very humble and simple life. He died after a few days' illness on the 25th of September 1617 at Lisbon.

The collected works of Suarez have been printed at Mainz and Lyons (1630), at Venice (1740–1751), at Besançon (1856–1862) and in the collection of the Abbé Migne. His life has been written by Deschamps (*Vita Fr. Suaresii*, Perpignan, 1671). The chief modern authorities are K. Werner's *Franz Suarez u. die Scholastik der letzten Jahrhunderte* (Regensburg, 1861), and Stöckl's *Geschichte der Philosophie des Mittelalters*, iii. 643 seq.

SUBIACO (anc. *Sublaqueum*), a town of Italy, in the province of Rome, from which it is 47 m. E. by rail, picturesquely situated on the right bank of the Anio, 1339 ft. above sea-level. Pop. (1901), 7076 (town), 8003 (commune). It has ironworks and paper-mills. Sublaqueum was so called from its position under the three artificial lakes constructed in the gorge of the Anio in connexion with the aqueduct of the Anio Novus, which had its intake at the lower end of the lowest of them (the *Simbruina stagna* of Tacitus). On the banks of this lake Nero constructed a villa, in the remains of which was found the beautiful headless statue of a youth kneeling, now in the Museo delle Terme at Rome. There is no mention of the villa after Nero's time. The lakes gradually ceased to exist owing to the action of the Anio, the last dam being washed away in 1305. In 494 St Benedict retired to this spot, then already deserted, and took up his abode as a hermit in a cave (Sacro Speco) above the lakes of the Anio. In 505, probably, he founded the first of his twelve monasteries, completing their number between 510 and 529, when he went to Cassino. The chronicles state that the principal monastery was devastated by the Lombards in 601, and rebuilt in 705; but there is little foundation for these statements. The first authentic document that we have is the mention in the *Liber pontificalis* of the gift of vestments by Leo IV. (847–855) to the monastery of S. Silvester, S. Benedict and S. Scholastica, and to the church of SS. Cosmas and Damian. The former is probably that at the Sacro Speco. The monastery was confirmed in its possessions by Pope Gregory I.[1] and his successors, and had by the 10th century very considerable landed properties with feudal jurisdiction enumerated in several documents, the first dating from 926, and an inscription of 1052 (cf. *Regesto sublacense*, Rome, 1891). The church dedicated to S. Scholastica, S. Benedict's sister, was erected in 981, according to an inscription belonging to a later date, but carved upon a slab decorated with reliefs of the end of the 8th, or the beginning of the 9th, century.

In 1053 the church was restored and a campanile built, which still exists; and in the middle of the 13th century the church was rebuilt in the Gothic style. Other buildings grew up round it; the cloister on the right is a fine Romanesque arcaded court with twisted columns and mosaics, the south side of which was constructed by Lorenzo, the first of the family of the Cosmati, early in the 13th century, while the other three sides are due to his son Jacopo and to Jacopo's sons Luca and Jacopo, who worked here in the time of the abbot Lando (1227–1243). The irregular atrium in front of the church is probably contemporary with its reconstruction in the Gothic style about 1274, while the outer court dates from the end of the 16th century. The church, with the exception of the campanile, was modernized in 1771–1777. The right of the monks to elect their own abbot, who had by that time obtained a position of great importance, was cancelled in 1388, and in 1455 the abbot was suspended, and the administration handed over to the Spanish cardinal, Giovanni Torquemada. For the whole of the 16th century it was in the hands of the Colonna family, who were commendatories of it. During the 17th century, the Barberini held it, but in 1753 Benedict XIV. separated the spiritual and temporal dominions, placing the latter under officials directly dependent on the papacy. The commendatories were as a rule cardinals. As regards monastic discipline, the abbey had since 1514 been subject to the rule of Monte Cassino, and it was only in 1872 that it regained from

[1] The bull of 596 attributed to him is, however, now recognized as apocryphal.

Pius IX. its independence and became an autonomous congregation. Arnold Pannartz and Conrad Schweinheim, two German ecclesiastics, set up here the first printing press in Italy, issuing an edition of Donatus (1465), followed by one of Cicero (1465) and of Lactantius (1465). Copies of the Lactantius, of the Augustine of 1467, which was probably printed not here but in Rome, whither the printers migrated in that year, and of other rare *incunabula* are still preserved here. Still more interesting is the monastery of the Sacro Speco, higher up the hill, dating, it would seem, from the 9th century, though little earlier than the 13th remains. The Grotta dei Pastori contains some frescoes of the 9th century, while the Sacro Speco, or cave of St Benedict, contains frescoes of the 13th, and so does the lower church, the latter having been decorated in the first twenty years of the 13th century, and in part repainted in the latter half of the same century by an otherwise unknown master Conxolus. The upper church contains scenes from the life of Christ by an unknown Sienese master of the end of the 14th century, to whom is also attributable a remarkable fresco of the triumph of death, on the stairs from the tower church to the Cappella dei Pastori, and some 15th-century work, and in the chapel of S. Gregory a remarkable portrait of St Francis of Assisi (who was perhaps here in 1218), probably painted before 1228, as it lacks the halo and the stigmata. The whole group of buildings is constructed against the rocky sides of the gorge, part of it on massive substructions. The town contains various buildings constructed by Pius VI., who as cardinal was commendatory abbot of Subiaco. It is crowned by a medieval castle constructed originally by Gregory VII.

See P. Egidi, G. Giovannoni, F. Hermanin, V. Federici, *I Monasteri di Subiaco* (Rome, 1904); A. Colasanti, *L'Aniene* (Bergamo, 1906). (T. As.)

SUBINFEUDATION, in English law, the practice by which tenants, holding land under the king or other superior lord, carved out in their turn by subletting or alienating a part of their lands new and distinct tenures. The tenants were termed "mesne-lords," with regard to those holding from them, the immediate tenant being tenant *in capite*. The lowest tenant of all was the freeholder, or, as he was sometimes termed tenant paravail. The Crown, who in theory owned all lands, was lord paramount.[1] The great lords looked with dissatisfaction on the increase of such subtenures. Accordingly in 1290 a statute was passed, *Quia emptores*, which allowed the tenant to alienate whenever he pleased, but the alienee or person to whom he granted was to hold the land not of the alienor but of the same immediate lord, and by the same services as the alienor held it before. (See further, MANOR.)

SUBJECTIVISM, a philosophical term, applied in general to all theories which lay stress on the purely mental sides of experience opposed to objectivism. In the narrowest sense subjectivism goes to the logical extreme of denying that mind can know objects at all (cf. SOLIPSISM). The doctrine originates in the fact that the most elementary psychic phenomena presuppose in addition to the data of the senses (which as such are momentary) a combining action of the mind. (See IDEALISM.)

SUBLEYRAS, PIERRE (1699–1749), French painter, was born at Uzès (Gard) in 1699. He left France for Italy in 1728, having carried off the *grand prix*. He there painted for the Canons of Asti "Christ's Visit to the House of Simon the Pharisee" (Louvre, engraved by Subleyras himself), a large work, which made his reputation and procured his admission into the Academy of St Luke. Cardinal Valenti Gonzaga next obtained for him the order for "Saint Basil and the Emperor Valens" (small study in Louvre), which was executed in mosaic for St Peter's. Benedict XIV. and all the princes of Rome sat to him, and the pope himself commanded two great paintings—the "Marriage of St Catherine" and the "Ecstasy of St Camilla"—which he placed in his private apartments. Subleyras shows greater individuality in his curious genre pictures, which he produced in considerable number (Louvre). In his illustrations of La Fontaine and Boccaccio his true relation to the modern era comes out; and his drawings from nature are often admirable (see one of a man draped in a heavy cloak in the British Museum). Exhausted by overwork, Subleyras tried a change to Naples, but returned to Rome at the end of a few months to die (May 28, 1749). His wife, the celebrated miniature painter, Maria Felice Tibaldi, was sister to the wife of Trémollière.

[1] *Paramount* and *paravail* are derived from the Latin *ad montem* and *ad vallem*, signifying the highest and lowest, respectively.

SUBLIME (Lat. *sublimis*, exalted), in aesthetics, a term applied to the quality of transcendant greatness, whether physical, moral, intellectual or artistic. It is specially used for a greatness with which nothing else can be compared and which is beyond all possibility of calculation or measurement. Psychologically the effect of the perception of the sublime is a feeling of awe or helplessness. The first study of the value of the sublime is the treatise ascribed to Longinus (*q.v.*), *On the Sublime* (strictly Περὶ ὕψους). Burke and Kant both investigated the subject (cf. Burke's *Essay on the Sublime and Beautiful*, 1756) and both distinguished the sublime from the beautiful. Later writers tend to include the sublime in the beautiful (see AESTHETICS).

SUBLIMINAL SELF. The phrase "subliminal self," which is one that has figured largely of recent years in discussions of the problems of "Psychical Research," owes its wide currency to the writings of F. W. H. Myers, especially to his posthumous work *Human Personality and its survival of Bodily Death*. It is used in a wider, looser sense and a narrower, stricter sense, which two senses are often confused in a way very detrimental to clear thinking. In the stricter usage the phrase implies the peculiar conception of human personality expounded at great length and with a wealth of learning and eloquence by Myers; it stands for an hypothesis which seemed to its author to bring almost all the strange facts he and his associates observed, as well as many alleged facts whose reality still remains in dispute, under one scheme of explanation and to bring them also into intelligible relation with the body of generally accepted scientific principles. But the phrase "Subliminal Self" is now often used by those who do not fully accept Myers's hypothesis, as a convenient heading to which to refer all the facts of many different kinds that seem to imply subconscious or unconscious mental operations. This article is only concerned to expound the meaning of the phrase as it was employed by Myers, and it is much to be wished that it should only be used in this stricter sense.

In the speculations of Schopenhauer and of Eduard von Hartmann, the "Unconscious" played a great part as a metaphysical principle explanatory of the phenomena of the life and mind of both men and animals. But with these exceptions, the philosophers and psychologists of the 19th century showed themselves in the main reluctant to admit the propriety of any conception of unconscious or subconscious mental states or operations. The predominant tendency was to regard as the issue of "automatic" nervous action or of "unconscious cerebration" whatever bodily movements seemed to take place independently of the consciousness and volition of the subject, even if those movements seemed to be of an intelligent and purposeful character. This attitude towards the subconscious is still maintained by some of the more strictly orthodox scientists; but it is now very widely accepted that we must recognize in some sense the reality of subconsciousness or of subliminal psychical process. The conception of a *limen* (threshold) of consciousness, separating subconscious or subliminal psychical process from supraliminal or conscious psychical process, figured prominently in the works of G. T. Fechner, the father of psycho-physics, and by him was made widely familiar. Fechner sought to prove that a sensory stimulus too feeble to affect consciousness produces nevertheless a psychical effect which remains below the threshold of consciousness, and he tried to show ground for believing in the existence of a vast realm of such subliminal psychical processes. But his arguments, founded though they were on epoch-making experiments, have failed to carry conviction; and it is in the main on other grounds than those adduced by Fechner that the reality of modes of mental operation which may properly be called subconscious or subliminal is now generally admitted. During the last quarter of the 19th and the opening years of the 20th century, there has been accumulated a mass of observations which suffices, in the opinion of many of those best qualified to judge, to establish the reality of processes which express themselves in purposeful actions and which bear all the marks from which we are accustomed to infer conscious cognition and volition, but of which nevertheless the subject or normal personality has no knowledge or awareness other than such as may be shared by any second person observing his actions.

Among the commonest and most striking of such manifestations is the "automatic writing" which a considerable proportion of normal persons are capable of producing. A person who has this power may sit absorbed in reading or in conversation, while his hand produces written words or sentences, of which he knows nothing until he afterwards reads them. The matter so written varies in different cases from illegibly scrawled fragments of words and sentences to long, connected, sometimes eloquent, frequently more or less dramatic, disquisitions. In some cases the "automatically" writing hand can be induced to make intelligible replies to questions whispered or otherwise put to the subject in such a way as not to draw his attention from some other object or topic with which it seems to be fully occupied. In some cases the matter so written states facts previously known to the subject but which he is unable to recollect by any voluntary effort. And in rare cases the matter written seems to imply knowledge or capacities which the subject was not believed to possess either by himself or by his friends. Other actions, including connected speech, may be produced in a similar fashion, and in the last case the subject hears and understands the words uttered from his own mouth in the same way only as those from the mouth of another person. "Table-tilting," "planchette-writing," and the various similar modes of spelling out by the aid of a code intelligible replies to questions, which have long been current in spiritistic circles and which, by those who practise them, are often regarded as the operations of disembodied intelligences, seem to belong to the same class of process. In extreme cases the manifestations of such subconscious or (better) co-conscious operations are so frequent, exhibit so much continuity and express so clearly a train of thought, purpose and memory, that they compel us to infer an organized personality of which they are the expression; such are the cases of double or multiple consciousness or personality. Very similar manifestations of a "co-consciousness" may be produced in a considerable proportion of apparently normal persons by means of post-hypnotic suggestion; as when suggestions are made during hypnosis, which afterwards the subject carries out without being aware of the actions, or of the signals in response to which he acts, and without any awareness or remembrance of the nature of the suggestions made to him. The more sober-minded of the investigators of these phenomena have sought to display all such cases as instances of division of the normal personality, and as explicable by the principle of cerebral dissociation (see HYPNOTISM); the more adventurous, concentrating their attention on the more extreme instances, regard all such manifestations as instances of the possession and control (partial or complete) of the organism of one person by the spirit or soul of another, generally a deceased person. Myers's hypothesis of the subliminal self was a brilliant attempt to follow a middle way in the explanation of these strange cases, to reconcile the two kinds of explanation with one another, and at the same time to bring into line with these other alleged facts of perplexing character, especially veridical hallucinations (*q.v.*), various types of communication at a distance (see TELEPATHY), and all the more striking instances of the operation of suggestion and of hypnosis, including the exaltation of the powers of the senses, of the memory and of control over the organic processes.

Myers conceived the soul of man as capable of existing independently of the body in some super-terrestrial or extra-terrene realm. He regarded our normal mental life as only a very partial expression of the capacities of the soul, so much only as can manifest itself through the human brain. He regarded the brain as still at a comparatively early stage of its evolution as an instrument through which the soul operates in the material world. So much of the life of the soul as fails to find expression in our conscious and organic life through its interactions with this very inadequate material mechanism remains beneath the threshold of consciousness and is said to constitute the subliminal self. The subliminal self as thus conceived would be better described as the subliminal part of the self, a part which surpasses the supraliminal or normal conscious self to an indefinitely great degree as regards its range of psychical faculties. It was further conceived as being in touch with a realm of psychical forces from which it is able to draw supplies of energy which it infuses into the organism, normally in limited quantities, but, in exceptionally favourable circumstances, in great floods, which for the time being raise the mental operations and the powers of the mind over the body to an abnormally high level.

It is a leading feature of this protean conception, that many of the abnormal mental manifestations that have commonly been regarded as symptoms of mental or nervous disease or degeneration are by its aid brought into line with mental processes that are by common consent of an unusually high type, the intuitions of genius, the outbursts of inspired poesy, the emotional fervour or the ecstasy that carries the martyr triumphantly through the severest trials, the enthusiasm that enables the human organism to carry through incredible labours. Myers's hypothesis thus boldly inverts the dominant view, which sees in all departures from the normal symptoms of weakness and degeneracy and which seeks to bring genius and ecstasy down to the level of madness and hysteria; the hypothesis of the subliminal self seeks to level up, rather than to level down, and to display many of these departures from normal mental life as being of the same nature as the operations of genius, as being, in common with these, uprushes of the subliminal self, which temporarily acquires a more complete control of the organism and therefore achieves at such times a more complete expression of its powers. And these rare displays of subliminal capacities are held to foreshadow the further course of mental evolution, to afford us a glimpse of the higher plane on which the mind of man may habitually and normally live, if further evolution of the nervous system shall render it a less inadequate medium for the exercise of the spiritual faculties and for the influx of the psychical energies which at present, owing to its imperfections, are for the most part latent or confined to the subliminal self.

This bold and far-reaching hypothesis has not up to the present time been accepted by any considerable number of professional psychologists, though its author's great literary power has secured for him a respectful hearing. The comparative indifference shown to it by the scientific and philosophical world must be ascribed to considerations of two kinds. In the first place, it is rightly felt that a very large proportion of the alleged facts which it is designed to explain are not yet supported by evidence of such a nature as warrants an unreserved acceptance of them. Secondly, even if further investigations of the type of those carried on by the Society for Psychical Research should prove Myers's belief in the reality of all or most of these facts to have been well-founded, there will remain difficulties and weaknesses intrinsic to the hypothesis, which at present seem very serious. In addition to all the great difficulties that must attach to any conception of human personality as a spiritual entity capable of existing independently of the body, Myers's conception raises many difficulties peculiar to itself, the chief of which may be briefly indicated. First, the conception of the relation of the subliminal to the normal or supraliminal self is in Myers's presentation extremely vacillating and uncertain, and it is probably radically incapable of definition and consistency. Secondly, two alleged supernormal phenomena, to the establishment of which "psychical research" has been devoted most energetically and (in the view of many of the workers) with the greatest success, and which from every point of view are the most important and interesting, are supernormal communications between the living (telepathy) and communication between the dead and the living. Now, if either or both of these modes of communication should eventually prove to be facts of nature, neither will need the hypothesis of the subliminal self for its explanation. Such evidence as we have of the latter kind of communication is almost wholly of the form of messages written or spoken by entranced persons (see TRANCE) which claim to be sent by the souls of the dead to friends still living, and these messages (if they are what they claim to be) imply, and were held by Myers himself to imply, possession or control of the brain of the living medium by the soul of the dead who transmits the message. Both phenomena need, then, for their explanation only the two great assumptions—first, that the soul is an entity capable of disembodied existence; second, that in its psycho-physical interactions any soul is not strictly confined to interaction with one particular brain.

The third great difficulty is of an emotional order. All the laborious research whose results Myers has sought to harmonize by means of his conception of the "subliminal self" has been initiated and sustained by the desire of proving the continued existence of the human personality after the death of the body. But, if Myers's doctrine is true, that which survives the death of the body is not the normal self-conscious personality of a man such as is known and valued by his friends, but a personality of which this normal personality is but a stunted distorted fragment; and it would therefore seem that according to this doctrine death must involve so great a transformation that such slight continuity as obtains must be insufficient to yield the emotional satisfaction demanded. The hypothesis would thus seem to destroy in great measure the value of the belief which it seeks to justify and establish.
